# WHIZARD<sup>1</sup>

Wolfgang Kilian,<sup>2</sup> Thorsten Ohl,<sup>3</sup> Jürgen Reuter<sup>4</sup>

Version 2.2.7, Aug 11 2015

with contributions from: Fabian Bach, Felix Braam, Hans-Werner  
Boschmann, Bijan Chokoufé Nejad, David Gordo Gomez,  
Sebastian Schmidt, Marco Sekulla, Christian Speckner, Christian  
Weiss, Daniel Wiesler

<sup>1</sup>The original meaning of the acronym is *W, Higgs, Z, And Respective Decays*. The current program is much more than that, however.

## **Abstract**

**WHIZARD** is an application of the **VAMP** algorithm: Adaptive multi-channel integration and event generation. The bare **VAMP** library is augmented by modules for Lorentz algebra, particles, phase space, etc., such that physical processes with arbitrary complex final states [well, in principle...] can be integrated and *unweighted* events be generated.

# Contents

<b>1</b>	<b>Changes</b>	<b>23</b>
<b>2</b>	<b>Preliminaries</b>	<b>24</b>
<b>3</b>	<b>Utilities</b>	<b>26</b>
3.1	File Utilities . . . . .	26
3.1.1	Deleting a file . . . . .	27
3.2	File Registries . . . . .	27
3.2.1	File handle . . . . .	28
3.2.2	File handles registry . . . . .	30
3.3	String Utilities . . . . .	32
3.3.1	Upper and Lower Case . . . . .	32
3.3.2	C-compatible Output . . . . .	33
3.3.3	Number Conversion . . . . .	34
3.4	Format Utilities . . . . .	35
3.4.1	Line Output . . . . .	36
3.4.2	TeX-compatible Output . . . . .	36
3.4.3	Metapost-compatible Output . . . . .	38
3.4.4	Conditional Formatting . . . . .	38
3.4.5	Compressed output of integer arrays . . . . .	38
3.5	Format Definitions . . . . .	39
<b>4</b>	<b>Testing</b>	<b>41</b>
4.1	Unit tests . . . . .	41
4.1.1	Parameters . . . . .	42
4.1.2	Type for storing test results . . . . .	42
4.1.3	Wrapup . . . . .	44
4.1.4	Tool for Unit Tests . . . . .	44
4.1.5	Convenience functions . . . . .	46
<b>5</b>	<b>System: Interfaces and Handlers</b>	<b>49</b>
5.1	Constants . . . . .	49
5.1.1	Version . . . . .	50
5.1.2	Text Buffer . . . . .	50
5.1.3	IOSTAT Codes . . . . .	50
5.1.4	Character Codes . . . . .	50
5.2	C wrapper for sigaction . . . . .	50
5.3	C wrapper for printf . . . . .	53

5.4	Error, Message and Signal Handling . . . . .	54
5.4.1	Logfile . . . . .	67
5.4.2	Checking values . . . . .	68
5.4.3	Suppression of numerical noise . . . . .	71
5.4.4	Signal handling . . . . .	72
5.5	Operating-system interface . . . . .	74
5.5.1	Path variables . . . . .	75
5.5.2	System dependencies . . . . .	76
5.5.3	Dynamic linking . . . . .	82
5.5.4	Predicates . . . . .	85
5.5.5	Shell access . . . . .	86
5.5.6	Querying for a directory . . . . .	86
5.5.7	Fortran compiler and linker . . . . .	87
5.5.8	Controlling OpenMP . . . . .	90
5.5.9	Unit tests . . . . .	92
5.6	Interface for formatted I/O . . . . .	94
5.6.1	Parsing a C format string . . . . .	95
5.6.2	API . . . . .	102
5.6.3	Unit tests . . . . .	102
5.7	CPU timing . . . . .	104
5.7.1	Timer . . . . .	110
5.7.2	Unit tests . . . . .	112
<b>6</b>	<b>Combinatorics</b>	<b>118</b>
6.1	Bytes and such . . . . .	118
6.1.1	8-bit words: bytes . . . . .	119

! This file has been stripped of most comments. For documentation, refer
! to the source 'whizard.nw'
```

We are strict with our names:

```
(Standard module head)≡
implicit none
private
```

This is the way to evoke the kinds module (not contained in this source)

```
{Use kinds}≡  
    use kinds, only: default  
{Use kinds with double}≡  
    use kinds, only: default, double
```

And we make heavy use of variable-length strings

```
{Use strings}≡  
    use iso_varying_string, string_t => varying_string
```

# Chapter 3

# Utilities

These modules are intended as part of WHIZARD, but in fact they are generic and could be useful for any purpose.

The modules depend only on modules from the `basics` set.

**file\_utils** Procedures that deal with external files, if not covered by Fortran built-ins.

**file\_registries** Manage files that are accessed by their name.

**string\_utils** Some string-handling utilities. Includes conversion to C string.

**format\_utils** Utilities for pretty-printing.

**format\_defs** Predefined format strings.

## 3.1 File Utilities

This module provides miscellaneous tools associated with named external files. Currently only:

- Delete a named file

```
<file_utils.f90>≡  
<File header>  
  
module file_utils  
  
use io_units  
  
<Standard module head>  
  
<File utils: public>  
  
contains  
  
<File utils: procedures>  
  
end module file_utils
```

### 3.1.1 Deleting a file

Fortran does not contain a command for deleting a file. Here, we provide a subroutine that deletes a file if it exists. We do not handle the subtleties, so we assume that it is writable if it exists.

```
(File utils: public)≡
  public :: delete_file

(File utils: procedures)≡
  subroutine delete_file (name)
    character(*), intent(in) :: name
    logical :: exist
    integer :: u
    inquire (file = name, exist = exist)
    if (exist) then
      u = free_unit ()
      open (unit = u, file = name)
      close (u, status = "delete")
    end if
  end subroutine delete_file
```

## 3.2 File Registries

This module provides a file-registry facility. We can open and close files multiple times without inadvertently accessing a single file by two different I/O unit numbers. Opening a file the first time enters it into the registry. Opening again just returns the associated I/O unit. The registry maintains a reference count, so closing a file does not actually complete until the last reference is released.

File access will always be sequential, however. The file can't be opened at different positions simultaneously.

```
(file_registries.f90)≡
  <File header>

  module file_registries

  <Use strings>
  use io_units

  <Standard module head>

  <File registries: public>

  <File registries: types>

  contains

  <File registries: procedures>

end module file_registries
```

### 3.2.1 File handle

This object holds a filename (fully qualified), the associated unit, and a reference count. The idea is that the object should be deleted when the reference count drops to zero.

```
<File registries: types>≡
    type :: file_handle_t
        type(string_t) :: file
        integer :: unit = 0
        integer :: refcount = 0
    contains
        <File registries: file handle: TBP>
    end type file_handle_t
```

Debugging output:

```
<File registries: file handle: TBP>≡
    procedure :: write => file_handle_write

<File registries: procedures>≡
    subroutine file_handle_write (handle, u, show_unit)
        class(file_handle_t), intent(in) :: handle
        integer, intent(in) :: u
        logical, intent(in), optional :: show_unit
        logical :: show_u
        show_u = .false.; if (present (show_unit)) show_u = show_unit
        if (show_u) then
            write (u, "(3x,A,1x,I0,1x,'(,I0,')')") &
                char (handle%file), handle%unit, handle%refcount
        else
            write (u, "(3x,A,1x,'(,I0,')')") &
                char (handle%file), handle%refcount
        end if
    end subroutine file_handle_write
```

Initialize with a file name, don't open the file yet:

```
<File registries: file handle: TBP>+≡
    procedure :: init => file_handle_init

<File registries: procedures>+≡
    subroutine file_handle_init (handle, file)
        class(file_handle_t), intent(out) :: handle
        type(string_t), intent(in) :: file
        handle%file = file
    end subroutine file_handle_init
```

We check the `refcount` before actually opening the file.

```
<File registries: file handle: TBP>+≡
    procedure :: open => file_handle_open

<File registries: procedures>+≡
    subroutine file_handle_open (handle)
        class(file_handle_t), intent(inout) :: handle
        if (handle%refcount == 0) then
            handle%unit = free_unit ()
```

```

        open (unit = handle%unit, file = char (handle%file), action = "read", &
              status = "old")
    end if
    handle%refcount = handle%refcount + 1
end subroutine file_handle_open

```

Analogously, close if the refcount drops to zero. The caller may then delete the object.

```

<File registries: file handle: TBP>+≡
    procedure :: close => file_handle_close
<File registries: procedures>+≡
    subroutine file_handle_close (handle)
        class(file_handle_t), intent(inout) :: handle
        handle%refcount = handle%refcount - 1
        if (handle%refcount == 0) then
            close (handle%unit)
            handle%unit = 0
        end if
    end subroutine file_handle_close

```

The I/O unit will be nonzero when the file is open.

```

<File registries: file handle: TBP>+≡
    procedure :: is_open => file_handle_is_open
<File registries: procedures>+≡
    function file_handle_is_open (handle) result (flag)
        class(file_handle_t), intent(in) :: handle
        logical :: flag
        flag = handle%unit /= 0
    end function file_handle_is_open

```

Return the filename, so we can identify the entry.

```

<File registries: file handle: TBP>+≡
    procedure :: get_file => file_handle_get_file
<File registries: procedures>+≡
    function file_handle_get_file (handle) result (file)
        class(file_handle_t), intent(in) :: handle
        type(string_t) :: file
        file = handle%file
    end function file_handle_get_file

```

For debugging, return the I/O unit number.

```

<File registries: file handle: TBP>+≡
    procedure :: get_unit => file_handle_get_unit
<File registries: procedures>+≡
    function file_handle_get_unit (handle) result (unit)
        class(file_handle_t), intent(in) :: handle
        integer :: unit
        unit = handle%unit
    end function file_handle_get_unit

```

### 3.2.2 File handles registry

This is implemented as a doubly-linked list. The list exists only once in the program, as a private module variable.

Extend the handle type to become a list entry:

```
<File registries: types>+≡
  type, extends (file_handle_t) :: file_entry_t
    type(file_entry_t), pointer :: prev => null ()
    type(file_entry_t), pointer :: next => null ()
  end type file_entry_t
```

The actual registry. We need only the pointer to the first entry.

```
<File registries: public>≡
  public :: file_registry_t

<File registries: types>+≡
  type :: file_registry_t
    type(file_entry_t), pointer :: first => null ()
    contains
      <File registries: file registry: TBP>
  end type file_registry_t
```

Debugging output.

```
<File registries: file registry: TBP>≡
  procedure :: write => file_registry_write

<File registries: procedures>+≡
  subroutine file_registry_write (registry, unit, show_unit)
    class(file_registry_t), intent(in) :: registry
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: show_unit
    type(file_entry_t), pointer :: entry
    integer :: u
    u = given_output_unit (unit)
    if (associated (registry%first)) then
      write (u, "(1x,A)") "File registry:"
      entry => registry%first
      do while (associated (entry))
        call entry%write (u, show_unit)
        entry => entry%next
      end do
    else
      write (u, "(1x,A)") "File registry: [empty]"
    end if
  end subroutine file_registry_write
```

Open a file: find the appropriate entry. Create a new entry and add to the list if necessary. The list is extended at the beginning. Return the I/O unit number for the records.

```
<File registries: file registry: TBP>+≡
  procedure :: open => file_registry_open
```

```

⟨File registries: procedures⟩+≡
    subroutine file_registry_open (registry, file, unit)
        class(file_registry_t), intent(inout) :: registry
        type(string_t), intent(in) :: file
        integer, intent(out), optional :: unit
        type(file_entry_t), pointer :: entry
        entry => registry%first
    FIND_ENTRY: do while (associated (entry))
        if (entry%get_file () == file) exit FIND_ENTRY
        entry => entry%next
    end do FIND_ENTRY
    if (.not. associated (entry)) then
        allocate (entry)
        call entry%init (file)
        if (associated (registry%first)) then
            registry%first%prev => entry
            entry%next => registry%first
        end if
        registry%first => entry
    end if
    call entry%open ()
    if (present (unit)) unit = entry%get_unit ()
end subroutine file_registry_open

```

Close a file: find the appropriate entry. Delete the entry if there is no file connected to it anymore.

```

⟨File registries: file registry: TBP⟩+≡
    procedure :: close => file_registry_close

⟨File registries: procedures⟩+≡
    subroutine file_registry_close (registry, file)
        class(file_registry_t), intent(inout) :: registry
        type(string_t), intent(in) :: file
        type(file_entry_t), pointer :: entry
        entry => registry%first
    FIND_ENTRY: do while (associated (entry))
        if (entry%get_file () == file) exit FIND_ENTRY
        entry => entry%next
    end do FIND_ENTRY
    if (associated (entry)) then
        call entry%close ()
        if (.not. entry%is_open ()) then
            if (associated (entry%prev)) then
                entry%prev%next => entry%next
            else
                registry%first => entry%next
            end if
            if (associated (entry%next)) then
                entry%next%prev => entry%prev
            end if
            deallocate (entry)
        end if
    end if
end subroutine file_registry_close

```

### 3.3 String Utilities

This module provides tools associated with strings (built-in and variable). Currently:

- Upper and lower case for strings
- Convert to null-terminated C string

```
<string_utils.f90>≡
  <File header>

  module string_utils

    use, intrinsic :: iso_c_binding

    <Use kinds>
    <Use strings>

    <Standard module head>

    <String utils: public>

    <String utils: interfaces>

    contains

    <String utils: procedures>

  end module string_utils
```

#### 3.3.1 Upper and Lower Case

These are, unfortunately, not part of Fortran.

```
<String utils: public>≡
  public :: upper_case
  public :: lower_case

  <String utils: interfaces>≡
    interface upper_case
      module procedure upper_case_char, upper_case_string
    end interface
    interface lower_case
      module procedure lower_case_char, lower_case_string
    end interface

  <String utils: procedures>≡
    function upper_case_char (string) result (new_string)
      character(*), intent(in) :: string
      character(len(string)) :: new_string
      integer :: pos, code
      integer, parameter :: offset = ichar('A')-ichar('a')
```

```

do pos = 1, len (string)
    code = ichar (string(pos:pos))
    select case (code)
    case (ichar('a'):ichar('z'))
        new_string(pos:pos) = char (code + offset)
    case default
        new_string(pos:pos) = string(pos:pos)
    end select
end do
end function upper_case_char

function lower_case_char (string) result (new_string)
    character(*), intent(in) :: string
    character(len(string)) :: new_string
    integer :: pos, code
    integer, parameter :: offset = ichar('a')-ichar('A')
do pos = 1, len (string)
    code = ichar (string(pos:pos))
    select case (code)
    case (ichar('A'):ichar('Z'))
        new_string(pos:pos) = char (code + offset)
    case default
        new_string(pos:pos) = string(pos:pos)
    end select
end do
end function lower_case_char

function upper_case_string (string) result (new_string)
    type(string_t), intent(in) :: string
    type(string_t) :: new_string
    new_string = upper_case_char (char (string))
end function upper_case_string

function lower_case_string (string) result (new_string)
    type(string_t), intent(in) :: string
    type(string_t) :: new_string
    new_string = lower_case_char (char (string))
end function lower_case_string

```

### 3.3.2 C-compatible Output

Convert a FORTRAN string into a zero terminated C string.

```

⟨String utils: public⟩+≡
    public :: string_f2c

⟨String utils: interfaces⟩+≡
    interface string_f2c
        module procedure string_f2c_char, string_f2c_var_str
    end interface string_f2c

⟨String utils: procedures⟩+≡
    pure function string_f2c_char (i) result (o)
        character(*), intent(in) :: i

```

```

character(kind=c_char, len=len (i) + 1) :: o
o = i // c_null_char
end function string_f2c_char

pure function string_f2c_var_str (i) result (o)
  type(string_t), intent(in) :: i
  character(kind=c_char, len=len (i) + 1) :: o
  o = char (i) // c_null_char
end function string_f2c_var_str

```

### 3.3.3 Number Conversion

Create a string from a number. We use fixed format for the reals and variable format for integers.

```

<String utils: public>+≡
  public :: str

<String utils: interfaces>+≡
  interface str
    module procedure str_log, str_int, str_real
  end interface

<String utils: procedures>+≡
  function str_log (l) result (s)
    logical, intent(in) :: l
    type(string_t) :: s
    if (l) then
      s = "True"
    else
      s = "False"
    end if
  end function str_log

  function str_int (i) result (s)
    integer, intent(in) :: i
    type(string_t) :: s
    character(32) :: buffer
    write (buffer, "(I0)") i
    s = var_str (trim (adjustl (buffer)))
  end function str_int

  function str_real (x) result (s)
    real(default), intent(in) :: x
    type(string_t) :: s
    character(32) :: buffer
    write (buffer, "(ES17.10)") x
    s = var_str (trim (adjustl (buffer)))
  end function str_real

```

Auxiliary: Read real, integer, string value.

```

<String utils: public>+≡
  public :: read_rval
  public :: read_ival

```

```

⟨String utils: procedures⟩+≡
  function read_rval (s) result (rval)
    type(string_t), intent(in) :: s
    real(default) :: rval
    character(80) :: buffer
    buffer = s
    read (buffer, *) rval
  end function read_rval

  function read_ival (s) result (ival)
    type(string_t), intent(in) :: s
    integer :: ival
    character(80) :: buffer
    buffer = s
    read (buffer, *) ival
  end function read_ival

```

## 3.4 Format Utilities

This module provides miscellaneous tools associated with formatting and pretty-printing.

- Horizontal separator lines in output
- Indenting an output line
- Formatting a number for TeX output.
- Formatting a number for MetaPost output.
- Alternate numeric formats.

```

⟨format_utils.f90⟩≡
⟨File header⟩

module format_utils

⟨Use kinds⟩
⟨Use strings⟩
  use string_utils, only: lower_case

⟨Standard module head⟩

⟨Format utils: public⟩

contains

⟨Format utils: procedures⟩

end module format_utils

```

### 3.4.1 Line Output

Write a separator line.

```
<Format utils: public>≡
    public :: write_separator

<Format utils: procedures>≡
    subroutine write_separator (u, mode)
        integer, intent(in) :: u
        integer, intent(in), optional :: mode
        integer :: m
        m = 1; if (present (mode)) m = mode
        select case (m)
        case default
            write (u, "(A)") repeat ("-", 72)
        case (1)
            write (u, "(A)") repeat ("-", 72)
        case (2)
            write (u, "(A)") repeat ("=", 72)
        end select
    end subroutine write_separator
```

Indent the line with given number of blanks.

```
<Format utils: public>+≡
    public :: write_indent

<Format utils: procedures>+≡
    subroutine write_indent (unit, indent)
        integer, intent(in) :: unit
        integer, intent(in), optional :: indent
        if (present (indent)) then
            write (unit, "(1x,A)", advance="no") repeat (" ", indent)
        end if
    end subroutine write_indent
```

### 3.4.2 T<sub>E</sub>X-compatible Output

Quote underscore characters for use in T<sub>E</sub>X output.

```
<Format utils: public>+≡
    public :: quote_underscore

<Format utils: procedures>+≡
    function quote_underscore (string) result (quoted)
        type(string_t) :: quoted
        type(string_t), intent(in) :: string
        type(string_t) :: part
        type(string_t) :: buffer
        buffer = string
        quoted = ""
        do
            call split (part, buffer, "_")
            quoted = quoted // part
            if (buffer == "") exit
```

```

        quoted = quoted // "\_"
    end do
end function quote_underscore
```

Format a number with  $n$  significant digits for use in TeX documents.

```

⟨Format utils: public⟩+≡
public :: tex_format

⟨Format utils: procedures⟩+≡
function tex_format (rval, n_digits) result (string)
    type(string_t) :: string
    real(default), intent(in) :: rval
    integer, intent(in) :: n_digits
    integer :: e, n, w, d
    real(default) :: absval
    real(default) :: mantissa
    character :: sign
    character(20) :: format
    character(80) :: cstr
    n = min (abs (n_digits), 16)
    if (rval == 0) then
        string = "0"
    else
        absval = abs (rval)
        e = int (log10 (absval))
        if (rval < 0) then
            sign = "-"
        else
            sign = ""
        end if
        select case (e)
        case (:−3)
            d = max (n - 1, 0)
            w = max (d + 2, 2)
            write (format, "('F',IO,'.',IO,',A,IO,A')") w, d
            mantissa = absval * 10._default ** (1 - e)
            write (cstr, fmt=format) mantissa, "\times 10^{", e - 1, "}"
        case (−2:0)
            d = max (n - e, 1 - e)
            w = max (d + e + 2, d + 2)
            write (format, "('F',IO,'.',IO,'')") w, d
            write (cstr, fmt=format) absval
        case (1:2)
            d = max (n - e - 1, -e, 0)
            w = max (d + e + 2, d + 2, e + 2)
            write (format, "('F',IO,'.',IO,'')") w, d
            write (cstr, fmt=format) absval
        case default
            d = max (n - 1, 0)
            w = max (d + 2, 2)
            write (format, "('F',IO,'.',IO,',A,IO,A')") w, d
            mantissa = absval * 10._default ** (- e)
            write (cstr, fmt=format) mantissa, "\times 10^{", e, "}"
        end select
```

```

        string = sign // trim (cstr)
    end if
end function tex_format
```

### 3.4.3 Metapost-compatible Output

Write a number for use in Metapost code:

```

⟨Format utils: public⟩+≡
public :: mp_format

⟨Format utils: procedures⟩+≡
function mp_format (rval) result (string)
    type(string_t) :: string
    real(default), intent(in) :: rval
    character(16) :: tmp
    write (tmp, "(G16.8)") rval
    string = lower_case (trim (adjustl (trim (tmp))))
end function mp_format
```

### 3.4.4 Conditional Formatting

Conditional format string, intended for switchable numeric precision.

```

⟨Format utils: public⟩+≡
public :: pac_fmt

⟨Format utils: procedures⟩+≡
subroutine pac_fmt (fmt, fmt_orig, fmt_pac, pacify)
    character(*), intent(in) :: fmt_orig, fmt_pac
    character(*), intent(out) :: fmt
    logical, intent(in), optional :: pacify
    logical :: pacified
    pacified = .false.
    if (present (pacify)) pacified = pacify
    if (pacified) then
        fmt = fmt_pac
    else
        fmt = fmt_orig
    end if
end subroutine pac_fmt
```

### 3.4.5 Compressed output of integer arrays

```

⟨Format utils: public⟩+≡
public :: write_compressed_integer_array

⟨Format utils: procedures⟩+≡
subroutine write_compressed_integer_array (chars, array)
    character(len=*), intent(out) :: chars
    integer, intent(in), allocatable, dimension(:) :: array
    logical, dimension(:, ), allocatable :: used
```

```

character(len=16) :: tmp
type(string_t) :: string
integer :: i, j, start_chain, end_chain
chars = '[none]'
string = ""
if (allocated (array)) then
    if (size (array) > 0) then
        allocate (used (size (array)))
        used = .false.
        do i = 1, size (array)
            if (.not. used(i)) then
                start_chain = array(i)
                end_chain = array(i)
                used(i) = .true.
            EXTEND: do
                do j = 1, size (array)
                    if (array(j) == end_chain + 1) then
                        end_chain = array(j)
                        used(j) = .true.
                    cycle EXTEND
                end if
                if (array(j) == start_chain - 1) then
                    start_chain = array(j)
                    used(j) = .true.
                cycle EXTEND
            end if
        end do
        exit
    end do EXTEND
    if (end_chain - start_chain > 0) then
        write (tmp, "(I0,A,I0)") start_chain, "-", end_chain
    else
        write (tmp, "(I0)") start_chain
    end if
    string = string // trim (tmp)
    if (any (.not. used)) then
        string = string // ','
    end if
    end if
    end do
    chars = string
end if
end if
chars = adjustr (chars)
end subroutine write_compressed_integer_array

```

### 3.5 Format Definitions

This module provides named integer parameters that specify certain format strings, used for numerical output.

`(format_defs.f90)≡`

*(File header)*

```
module format_defs
```

*(Standard module head)*

*(Format defs: public parameters)*

```
end module format_defs
```

We collect format strings for various numerical output formats here.

*(Format defs: public parameters)≡*

```
character(*), parameter, public :: FMT_19 = "ES19.12"
character(*), parameter, public :: FMT_18 = "ES18.11"
character(*), parameter, public :: FMT_17 = "ES17.10"
character(*), parameter, public :: FMT_16 = "ES16.9"
character(*), parameter, public :: FMT_15 = "ES15.8"
character(*), parameter, public :: FMT_14 = "ES14.7"
character(*), parameter, public :: FMT_13 = "ES13.6"
character(*), parameter, public :: FMT_12 = "ES12.5"
character(*), parameter, public :: FMT_11 = "ES11.4"
character(*), parameter, public :: FMT_10 = "ES10.3"
```

# Chapter 4

## Testing

This part contains tools for automatic testing.

**unit\_tests** A handler that executes test procedures and compares and collects results.

### 4.1 Unit tests

We provide functionality for automated unit tests. Each test is required to produce output which is compared against a reference file. If the two are identical, we signal success. Otherwise, we signal failure and write the output to a file.

```
(unit_tests.f90)≡
  <File header>

  module unit_tests

    <Use kinds>
    use constants, only: zero, tiny_10, tiny_13
    <Use strings>
    use format_defs
    use io_units

    <Standard module head>

    <Tests: public>
    <Tests: parameters>
    <Tests: types>
    <Tests: interfaces>

    contains

    <Tests: procedures>

  end module unit_tests
```

### 4.1.1 Parameters

Building blocks of file names. The directory names and suffixes are hard-coded here, and they must reflect actual Makefile targets where applicable.

```
<Tests: parameters>≡
    character(*), parameter :: ref_prefix = "ref-output/"
    character(*), parameter :: ref = ".ref"

    character(*), parameter :: err_prefix = "err-output/"
    character(*), parameter :: err = ".out"
```

### 4.1.2 Type for storing test results

We store the results of the individual unit tests in a linked list. Here is the entry:

```
<Tests: public>≡
    public :: test_results_t

<Tests: types>≡
    type :: test_result_t
        logical :: success = .false.
        type(string_t) :: name
        type(string_t) :: description
        type(test_result_t), pointer :: next => null ()
    end type test_result_t

    type :: test_results_t
        private
        type(test_result_t), pointer :: first => null ()
        type(test_result_t), pointer :: last => null ()
        integer :: n_success = 0
        integer :: n_failure = 0
        contains
            <Tests: test results: TBP>
    end type test_results_t
```

Add a test result.

```
<Tests: test results: TBP>≡
    procedure, private :: add => test_results_add

<Tests: procedures>≡
    subroutine test_results_add (list, name, description, success)
        class(test_results_t), intent(inout) :: list
        character(len=*), intent(in) :: name
        character(len=*), intent(in) :: description
        logical, intent(in) :: success
        type(test_result_t), pointer :: result
        allocate (result)
        result%success = success
        result%name = name
        result%description = description
        if (associated (list%first)) then
            list%last%next => result
```

```

    else
        list%first => result
    end if
    list%last => result
    if (success) then
        list%n_success = list%n_success + 1
    else
        list%n_failure = list%n_failure + 1
    end if
end subroutine test_results_add

```

Display the current state.

```

⟨Tests: test results: TBP⟩+≡
    procedure, private :: write => test_results_write
⟨Tests: procedures⟩+≡
    subroutine test_results_write (list, u)
        class(test_results_t), intent(in) :: list
        integer, intent(in) :: u
        type(test_result_t), pointer :: result
        write (u, "(A)") "*** Test Summary ***"
        if (list%n_success > 0) then
            write (u, "(2x,A)") "Success:"
            result => list%first
            do while (associated (result))
                if (result%success) write (u, "(4x,A,: ',A)") &
                    char (result%name), char (result%description)
                result => result%next
            end do
        end if
        if (list%n_failure > 0) then
            write (u, "(2x,A)") "Failure:"
            result => list%first
            do while (associated (result))
                if (.not. result%success) write (u, "(4x,A,: ',A)") &
                    char (result%name), char (result%description)
                result => result%next
            end do
        end if
        write (u, "(A,I0)") "Total    = ", list%n_success + list%n_failure
        write (u, "(A,I0)") "Success = ", list%n_success
        write (u, "(A,I0)") "Failure = ", list%n_failure
        write (u, "(A)") "*** End of test Summary ***"
    end subroutine test_results_write

```

Return true if all tests were successful (or no test).

```

⟨Tests: test results: TBP⟩+≡
    procedure, private :: report => test_results_report
⟨Tests: procedures⟩+≡
    subroutine test_results_report (list, success)
        class(test_results_t), intent(in) :: list
        logical, intent(out) :: success
        success = list%n_failure == 0

```

```
end subroutine test_results_report
```

Delete the list.

```
<Tests: test results: TBP>+≡  
procedure, private :: final => test_results_final  
<Tests: procedures>+≡  
subroutine test_results_final (list)  
    class(test_results_t), intent(inout) :: list  
    type(test_result_t), pointer :: result  
    do while (associated (list%first))  
        result => list%first  
        list%first => result%next  
        deallocate (result)  
    end do  
    list%last => null ()  
    list%n_success = 0  
    list%n_failure = 0  
end subroutine test_results_final
```

#### 4.1.3 Wrapup

This will write results, report status, and finalize. This is the only method which we need to access from outside.

```
<Tests: test results: TBP>+≡  
procedure :: wrapup => test_results_wrapup  
<Tests: procedures>+≡  
subroutine test_results_wrapup (list, u, success)  
    class(test_results_t), intent(inout) :: list  
    integer, intent(in) :: u  
    logical, intent(out), optional :: success  
    call list%write (u)  
    if (present (success))  call list%report (success)  
    call list%final ()  
end subroutine test_results_wrapup
```

#### 4.1.4 Tool for Unit Tests

This procedure takes a test routine as an argument. It runs the test, output directed to a temporary file. Then, it compares the file against a reference file.

The test routine must take the output unit as argument. We export this abstract interface, so the test drivers can reference it for declaring the actual test routines.

```
<Tests: public>+≡  
public :: unit_test
```

```

⟨Tests: interfaces⟩≡
    abstract interface
        subroutine unit_test (u)
            integer, intent(in) :: u
        end subroutine unit_test
    end interface

The test routine can print to screen and, optionally, to a logging unit.

⟨Tests: public⟩+≡
    public :: test

⟨Tests: procedures⟩+≡
    subroutine test (test_proc, name, description, u_log, results)
        procedure(unit_test) :: test_proc
        character(*), intent(in) :: name
        character(*), intent(in) :: description
        integer, intent(in) :: u_log
        type(test_results_t), intent(inout) :: results
        integer :: u_test, u_ref, u_err
        logical :: exist
        character(256) :: buffer1, buffer2
        integer :: iostat1, iostat2
        logical :: success
        write (*, "(A)", advance="no") "Running test: " // name
        write (u_log, "(A)") "Test: " // name
        u_test = free_unit ()
        open (u_test, status="scratch", action="readwrite")
        call test_proc (u_test)
        rewind (u_test)
        inquire (file=ref_prefix//name//ref, exist=exist)
        if (exist) then
            u_ref = free_unit ()
            open (u_ref, file=ref_prefix//name//ref, status="old", action="read")
            COMPARE_FILES: do
                read (u_test, "(A)", iostat=iostat1) buffer1
                read (u_ref, "(A)", iostat=iostat2) buffer2
                if (iostat1 /= iostat2) then
                    success = .false.
                    exit COMPARE_FILES
                else if (iostat1 < 0) then
                    success = .true.
                    exit COMPARE_FILES
                else if (buffer1 /= buffer2) then
                    success = .false.
                    exit COMPARE_FILES
                end if
            end do COMPARE_FILES
            close (u_ref)
        else
            write (*, "(A)", advance="no") "... no reference output available"
            write (u_log, "(A)") " No reference output available."
            success = .false.
        end if
        if (success) then

```

```

        write (*, "(A)") " ... success."
        write (u_log, "(A)") " Success."
    else
        write (*, "(A)") " ... failure. See: " // err_prefix//name//err
        write (u_log, "(A)") " Failure."
        rewind (u_test)
        u_err = free_unit ()
        open (u_err, file=err_prefix//name//err, &
              action="write", status="replace")
        WRITE_OUTPUT: do
            read (u_test, "(A)", end=1) buffer1
            write (u_err, "(A)") trim (buffer1)
        end do WRITE_OUTPUT
    1   close (u_err)
    end if
    close (u_test)
    call results%add (name, description, success)
end subroutine test

```

#### 4.1.5 Convenience functions

Unit tests should include a lot of assertions that only involve IO if something is wrong. `assert` allows to streamline this method.

```

<Tests: public>+≡
public :: assert
<Tests: procedures>+≡
subroutine assert (unit, ok, description)
    integer, intent(in) :: unit
    logical, intent(in) :: ok
    character(*), intent(in), optional :: description
    if (.not. ok) then
        if (present(description)) then
            write (unit, "(A)") "* FAIL: " // description
        else
            write (unit, "(A)") "* FAIL: Assertion error"
        end if
    end if
end subroutine assert

```

Compare numbers and output error message if not equal.

```

<Tests: public>+≡
public:: assert_equal
interface assert_equal
    module procedure assert_equal_real, assert_equal_integer
end interface

<Tests: procedures>+≡
subroutine assert_equal_real (unit, lhs, rhs, description, &
                            abs_smallness, rel_smallness)
    real(default), intent(in), optional :: abs_smallness, rel_smallness
    integer, intent(in) :: unit

```

```

real(default), intent(in) :: lhs, rhs
character(*), intent(in), optional :: description
logical :: ok
ok = nearly_equal (lhs, rhs, abs_smallness, rel_smallness)
if (.not. ok) then
    if (present(description)) then
        write (unit, "(A," // FMT_19 // ",A," // FMT_19 // ")") &
            "* FAIL: " // description // ":" , lhs, " /= ", rhs
    else
        write (unit, "(A," // FMT_19 // ",A," // FMT_19 // ")") &
            "* FAIL: Assertion error: ", lhs, " /= ", rhs
    end if
end if
end subroutine assert_equal_real

```

*(Tests: procedures)*+≡

```

subroutine assert_equal_integer (unit, lhs, rhs, description)
    integer, intent(in) :: unit
    integer, intent(in) :: lhs, rhs
    character(*), intent(in), optional :: description
    logical :: ok
    ok = lhs == rhs
    if (.not. ok) then
        if (present(description)) then
            write (unit, "(A,I0,A,I0)") &
                "* FAIL: " // description // ":" , lhs, " /= ", rhs
        else
            write (unit, "(A,I0,A,I0)") &
                "* FAIL: Assertion error: ", lhs, " /= ", rhs
        end if
    end if
end subroutine assert_equal_integer

```

Note that this poor man's check will be disabled if someone compiles with `-ffast-math` or similar optimizations.

*(Tests: procedures)*+≡

```

elemental function ieee_is_nan (x) result (yorn)
    logical :: yorn
    real(default), intent(in) :: x
    yorn = (x /= x)
end function ieee_is_nan

```

This is still not perfect but should work in most cases. Usually one wants to compare to a relative epsilon `rel_smallness`, except for numbers close to zero defined by `abs_smallness`. Both might need adaption to specific use cases but have reasonable defaults.

*(Tests: public)*+≡

```

public :: nearly_equal

```

*(Tests: procedures)*+≡

```

elemental function nearly_equal (a, b, abs_smallness, rel_smallness) result (r)
    logical :: r
    real(default), intent(in) :: a, b

```

```

real(default), intent(in), optional :: abs_smallness, rel_smallness
real(default) :: abs_a, abs_b, diff, abs_small, rel_small
abs_a = abs (a)
abs_b = abs (b)
diff = abs (a - b)
! shortcut, handles infinities and nans
if (a == b) then
    r = .true.
    return
else if (ieee_is_nan (a) .or. ieee_is_nan (b) .or. ieee_is_nan (diff)) then
    r = .false.
    return
end if
abs_small = tiny_13; if (present (abs_smallness)) abs_small = abs_smallness
rel_small = tiny_10; if (present (rel_smallness)) rel_small = rel_smallness
if (abs_a < abs_small .and. abs_b < abs_small) then
    r = diff < abs_small
else
    r = diff / max (abs_a, abs_b) < rel_small
end if
end function nearly_equal

```

Often we will need to check whether floats vanish:

```

⟨Tests: public⟩+≡
public:: vanishes
interface vanishes
    module procedure vanishes_real, vanishes_complex
end interface

⟨Tests: procedures⟩+≡
elemental function vanishes_real (x, abs_smallness, rel_smallness) result (r)
    logical :: r
    real(default), intent(in) :: x
    real(default), intent(in), optional :: abs_smallness, rel_smallness
    r = nearly_equal (x, zero, abs_smallness, rel_smallness)
end function vanishes_real

elemental function vanishes_complex (x, abs_smallness, rel_smallness) result (r)
    logical :: r
    complex(default), intent(in) :: x
    real(default), intent(in), optional :: abs_smallness, rel_smallness
    r = vanishes_real (abs (x), abs_smallness, rel_smallness)
end function vanishes_complex

```

# Chapter 5

# System: Interfaces and Handlers

Here, we collect modules that deal with the “system”: operating-system interfaces, error handlers and diagnostics.

**system\_defs** Constants relevant for the modules in this set.

**diagnostics** Error and diagnostic message handling. Any messages and errors issued by WHIZARD functions are handled by the subroutines in this module, if possible.

**os\_interface** Execute system calls, build and link external object files and libraries.

**cputime** Timer data type and methods, for measuring performance.

## 5.1 Constants

The parameters here are used in various parts of the program, starting from the modules in the current chapter. Some of them may be modified if the need arises.

```
(system_defs.f90)≡
  ⟨File header⟩

  module system_defs

    use, intrinsic :: iso_fortran_env, only: iostat_end, iostat_eor !NODEP!
    ⟨Standard module head⟩

    ⟨System defs: public parameters⟩

  end module system_defs
```

### 5.1.1 Version

The version string is used for checking files. Note that the string length MUST NOT be changed, because reading binary files relies on it.

```
(System defs: public parameters)≡  
    integer, parameter, public :: VERSION_STRLEN = 255  
    character(len=VERSION_STRLEN), parameter, public :: &  
        & VERSION_STRING = "WHIZARD version <Version> (<Date>)"
```

### 5.1.2 Text Buffer

There is a hard limit on the line length which we should export. This buffer size is used both by the message handler, the lexer, and some further modules.

```
(System defs: public parameters)+≡  
    integer, parameter, public :: BUFFER_SIZE = 1000
```

### 5.1.3 IOSTAT Codes

Defined in `iso_fortran_env`, but we would like to use shorthands.

```
(System defs: public parameters)+≡  
    integer, parameter, public :: EOF = iostat_end, EOR = iostat_eor
```

### 5.1.4 Character Codes

Single-character constants.

```
(System defs: public parameters)+≡  
    character, parameter, public :: BLANK = ' '  
    character, parameter, public :: TAB = achar(9)  
    character, parameter, public :: CR = achar(13)  
    character, parameter, public :: LF = achar(10)  
    character, parameter, public :: BACKSLASH = achar(92)
```

Character strings that indicate character classes.

```
(System defs: public parameters)+≡  
    character(*), parameter, public :: WHITESPACE_CHARS = BLANK// TAB // CR // LF  
    character(*), parameter, public :: LCLETTERS = "abcdefghijklmnopqrstuvwxyz"  
    character(*), parameter, public :: UCLETTERS = "ABCDEFGHIJKLMNOPQRSTUVWXYZ"  
    character(*), parameter, public :: DIGITS = "0123456789"
```

## 5.2 C wrapper for sigaction

This implements calls to `sigaction` and the appropriate signal handlers in C.

The functionality is needed for the `diagnostics` module.

```
(signal_interface.c)≡  
/*
```

```

⟨File header⟩
*/
#include <signal.h>
#include <stdlib.h>

extern int wo_sigint;
extern int wo_sigterm;
extern int wo_sigxcpu;
extern int wo_sigxfsz;

static void wo_handler_sigint (int sig) {
    wo_sigint = sig;
}

static void wo_handler_sigterm (int sig) {
    wo_sigterm = sig;
}

static void wo_handler_sigxcpu (int sig) {
    wo_sigxcpu = sig;
}

static void wo_handler_sigxfsz (int sig) {
    wo_sigxfsz = sig;
}

int wo_mask_sigint () {
    struct sigaction sa;
    sigset_t blocks;
    sigfillset (&blocks);
    sa.sa_flags = 0;
    sa.sa_mask = blocks;
    sa.sa_handler = wo_handler_sigint;
    return sigaction(SIGINT, &sa, NULL);
}

int wo_mask_sigterm () {
    struct sigaction sa;
    sigset_t blocks;
    sigfillset (&blocks);
    sa.sa_flags = 0;
    sa.sa_mask = blocks;
    sa.sa_handler = wo_handler_sigterm;
    return sigaction(SIGTERM, &sa, NULL);
}

int wo_mask_sigxcpu () {
    struct sigaction sa;
    sigset_t blocks;
    sigfillset (&blocks);
    sa.sa_flags = 0;
    sa.sa_mask = blocks;
    sa.sa_handler = wo_handler_sigxcpu;
    return sigaction(SIGXCPU, &sa, NULL);
}

```

```

}

int wo_mask_sigxfsz () {
    struct sigaction sa;
    sigset_t blocks;
    sigfillset (&blocks);
    sa.sa_flags = 0;
    sa.sa_mask = blocks;
    sa.sa_handler = wo_handler_sigxfsz;
    return sigaction(SIGXFSZ, &sa, NULL);
}

int wo_release_sigint () {
    struct sigaction sa;
    sigset_t blocks;
    sigfillset (&blocks);
    sa.sa_flags = 0;
    sa.sa_mask = blocks;
    sa.sa_handler = SIG_DFL;
    return sigaction(SIGINT, &sa, NULL);
}

int wo_release_sigterm () {
    struct sigaction sa;
    sigset_t blocks;
    sigfillset (&blocks);
    sa.sa_flags = 0;
    sa.sa_mask = blocks;
    sa.sa_handler = SIG_DFL;
    return sigaction(SIGTERM, &sa, NULL);
}

int wo_release_sigxcpu () {
    struct sigaction sa;
    sigset_t blocks;
    sigfillset (&blocks);
    sa.sa_flags = 0;
    sa.sa_mask = blocks;
    sa.sa_handler = SIG_DFL;
    return sigaction(SIGXCPU, &sa, NULL);
}

int wo_release_sigxfsz () {
    struct sigaction sa;
    sigset_t blocks;
    sigfillset (&blocks);
    sa.sa_flags = 0;
    sa.sa_mask = blocks;
    sa.sa_handler = SIG_DFL;
    return sigaction(SIGXFSZ, &sa, NULL);
}

```

### 5.3 C wrapper for printf

The `printf` family of functions is implemented in C with an undefined number of arguments. This is not supported by the `bind(C)` interface. We therefore write wrappers for the versions of `sprintf` that we will actually use.

This is used by the `formats` module.

```
<sprintf_interface.c>≡
/*
<File header>
*/
#include <stdio.h>

int sprintf_none(char* str, const char* format) {
    return sprintf(str, format);
}

int sprintf_int(char* str, const char* format, int val) {
    return sprintf(str, format, val);
}

int sprintf_double(char* str, const char* format, double val) {
    return sprintf(str, format, val);
}

int sprintf_str(char* str, const char* format, const char* val) {
    return sprintf(str, format, val);
}

<sprintf interfaces>≡
interface
    function sprintf_none (str, fmt) result (stat) bind(C)
        use iso_c_binding !NODEP!
        integer(c_int) :: stat
        character(c_char), dimension(*), intent(inout) :: str
        character(c_char), dimension(*), intent(in) :: fmt
    end function sprintf_none
end interface

interface
    function sprintf_int (str, fmt, val) result (stat) bind(C)
        use iso_c_binding !NODEP!
        integer(c_int) :: stat
        character(c_char), dimension(*), intent(inout) :: str
        character(c_char), dimension(*), intent(in) :: fmt
        integer(c_int), value :: val
    end function sprintf_int
end interface

interface
    function sprintf_double (str, fmt, val) result (stat) bind(C)
        use iso_c_binding !NODEP!
        integer(c_int) :: stat
        character(c_char), dimension(*), intent(inout) :: str
```

```

    character(c_char), dimension(*), intent(in) :: fmt
    real(c_double), value :: val
  end function sprintf_double
end interface

interface
  function sprintf_str(str, fmt, val) result (stat) bind(C)
    use iso_c_binding !NODEP!
    integer(c_int) :: stat
    character(c_char), dimension(*), intent(inout) :: str
    character(c_char), dimension(*), intent(in) :: fmt
    character(c_char), dimension(*), intent(in) :: val
  end function sprintf_str
end interface

```

## 5.4 Error, Message and Signal Handling

We are not so ambitious as to do proper exception handling in WHIZARD, but at least it may be useful to have a common interface for diagnostics: Results, messages, warnings, and such. As module variables we keep a buffer where the current message may be written to and a level indicator which tells which messages should be written on screen and which ones should be skipped. Alternatively, a string may be directly supplied to the message routine: this overrides the buffer, avoiding the necessity of formatted I/O in trivial cases.

```

<diagnostics.f90>≡
  <File header>

  module diagnostics

    use, intrinsic :: iso_c_binding !NODEP!
    use, intrinsic :: iso_fortran_env, only: output_unit !NODEP!

    <Use kinds>
    <Use strings>
      use string_utils, only: str
      use io_units

      use system_dependencies
      use system_defs, only: BUFFER_SIZE, MAX_ERRORS

```

*(Diagnostics: public)*+≡

```

public :: msg_level

```

*(Diagnostics: variables)*≡

```

integer, save, dimension(D_ALL:20) :: msg_level = RESULT

```

Mask fatal errors so that are treated as normal errors. Useful for interactive mode.

*(Diagnostics: public)*+≡

```

public :: mask_fatal_errors

```

*(Diagnostics: variables)*+≡

```

logical, save :: mask_fatal_errors = .false.

```

How to handle bugs and unmasked fatal errors. Either execute a normal stop statement, or call the C exit() function, or try to cause a program crash by dereferencing a null pointer.

*(Diagnostics: parameters)*+≡

```

integer, parameter :: TERM_STOP = 0, TERM_EXIT = 1, TERM_CRASH = 2

```

```
(Diagnostics: variables)+≡
    integer, save :: handle_fatal_errors = TERM_EXIT
```

Keep track of errors. This might be used for exception handling, later. The counter is incremented only for screen messages, to avoid double counting.

```
(Diagnostics: public)+≡
    public :: msg_count
```

```
(Diagnostics: variables)+≡
    integer, dimension(TERMINATE:WARNING), save :: msg_count = 0
```

Keep a list of all errors and warnings. Since we do not know the number of entries beforehand, we use a linked list.

```
(Diagnostics: types)≡
    type :: string_list
        character(len=BUFFER_SIZE) :: string
        type(string_list), pointer :: next
    end type string_list
    type :: string_list_pointer
        type(string_list), pointer :: first, last
    end type string_list_pointer
```

```
(Diagnostics: variables)+≡
    type(string_list_pointer), dimension(TERMINATE:WARNING), save :: &
        & msg_list = string_list_pointer (null(), null())
```

Add the current message buffer contents to the internal list.

```
(Diagnostics: procedures)+≡
    subroutine msg_add (level)
        integer, intent(in) :: level
        type(string_list), pointer :: message
        select case (level)
        case (TERMINATE:WARNING)
            allocate (message)
            message%string = msg_buffer
            nullify (message%next)
            if (.not.associated (msg_list(level)%first)) &
                & msg_list(level)%first => message
            if (associated (msg_list(level)%last)) &
                & msg_list(level)%last%next => message
            msg_list(level)%last => message
            msg_count(level) = msg_count(level) + 1
        end select
    end subroutine msg_add
```

Initialization:

```
(Diagnostics: public)+≡
    public :: msg_list_clear

(Diagnostics: procedures)+≡
    subroutine msg_list_clear
        integer :: level
        type(string_list), pointer :: message
        do level = TERMINATE, WARNING
            do while (associated (msg_list(level)%first))
```

```

    message => msg_list(level)%first
    msg_list(level)%first => message%next
    deallocate (message)
end do
nullify (msg_list(level)%last)
end do
msg_count = 0
end subroutine msg_list_clear

```

Display the summary of errors and warnings (no need to count fatals...)

```

<Diagnostics: public>+≡
public :: msg_summary

<Diagnostics: procedures>+≡
subroutine msg_summary (unit)
integer, intent(in), optional :: unit
call expect_summary (unit)
1 format (A,1x,I2,1x,A,I2,1x,A)
if (msg_count(ERROR) > 0 .and. msg_count(WARNING) > 0) then
    write (msg_buffer, 1) "There were", &
        & msg_count(ERROR), "error(s) and ", &
        & msg_count(WARNING), "warning(s)."
    call msg_message (unit=unit)
else if (msg_count(ERROR) > 0) then
    write (msg_buffer, 1) "There were", &
        & msg_count(ERROR), "error(s) and no warnings."
    call msg_message (unit=unit)
else if (msg_count(WARNING) > 0) then
    write (msg_buffer, 1) "There were no errors and ", &
        & msg_count(WARNING), "warning(s)."
    call msg_message (unit=unit)
end if
end subroutine msg_summary

```

Print the list of all messages of a given level.

```

<Diagnostics: public>+≡
public :: msg_listing

<Diagnostics: procedures>+≡
subroutine msg_listing (level, unit, prefix)
integer, intent(in) :: level
integer, intent(in), optional :: unit
character(len=*), intent(in), optional :: prefix
type(string_list), pointer :: message
integer :: u
u = given_output_unit (unit);  if (u < 0)  return
if (present (unit))  u = unit
message => msg_list(level)%first
do while (associated (message))
    if (present (prefix)) then
        write (u, "(A)") prefix // trim (message%string)
    else
        write (u, "(A)") trim (message%string)
    end if

```

```

    message => message%next
end do
flush (u)
end subroutine msg_listing

```

The message buffer:

```

<Diagnostics: public>+≡
public :: msg_buffer
<Diagnostics: variables>+≡
character(len=BUFFER_SIZE), save :: msg_buffer = " "

```

After a message is issued, the buffer should be cleared:

```

<Diagnostics: procedures>+≡
subroutine buffer_clear
msg_buffer = " "
end subroutine buffer_clear

```

The generic handler for messages. If the unit is omitted (or = 6), the message is written to standard output if the precedence is sufficiently high (as determined by the value of `msg_level`). If the string is omitted, the buffer is used. In any case, the buffer is cleared after printing. In accordance with FORTRAN custom, the first column in the output is left blank. For messages and warnings, an additional exclamation mark and a blank is prepended. Furthermore, each message is appended to the internal message list (without prepending anything).

```

```

The number of non-fatal errors that we allow before stopping the program. We might trade this later for an adjustable number.

*(System defs: public parameters)*+≡

```
integer, parameter, public :: MAX_ERRORS = 10
```

The specific handlers. In the case of fatal errors, bugs (failed assertions) and normal termination execution is stopped. For non-fatal errors a message is printed to standard output if no unit is given. Only if the number of MAX\_ERRORS errors is reached, we abort the program. There are no further actions in the other cases, but this may change.

#### 5.4.2 Checking values

The `expect` function does not just check a value for correctness (actually, it checks if a logical expression is true); it records its result here. If failures are present when the program terminates, the exit code is nonzero.

```

⟨Diagnostics: variables⟩+≡
    integer, save :: expect_total = 0
    integer, save :: expect_failures = 0

⟨Diagnostics: public⟩+≡
    public :: expect_record

```

```

⟨Diagnostics: procedures⟩+≡
  subroutine expect_record (success)
    logical, intent(in) :: success
    expect_total = expect_total + 1
    if (.not. success) expect_failures = expect_failures + 1
  end subroutine expect_record

⟨Diagnostics: public⟩+≡
  public :: expect_clear

⟨Diagnostics: procedures⟩+≡
  subroutine expect_clear ()
    expect_total = 0
    expect_failures = 0
  end subroutine expect_clear

⟨Diagnostics: public⟩+≡
  public :: expect_summary

⟨Diagnostics: procedures⟩+≡
  subroutine expect_summary (unit, force)
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: force
    logical :: force_output
    force_output = .false.; if (present (force)) force_output = force
    if (expect_total /= 0 .or. force_output) then
      call msg_message ("Summary of value checks:", unit)
      write (msg_buffer, "(2x,A,1x,I0,1x,A,1x,A,1x,I0)") &
        "Failures:", expect_failures, "/", "Total:", expect_total
      call msg_message (unit=unit)
    end if
  end subroutine expect_summary

```

end subroutine pacify_complex_default

```

#### 5.4.4 Signal handling

Killing the program by external signals may leave the files written by it in an undefined state. This can be avoided by catching signals and deferring program termination. Instead of masking only critical sections, we choose to mask signals globally (done in the main program) and terminate the program at predefined checkpoints only. Checkpoints are after each command, within the sampling function (so the program can be terminated after each event), and after each iteration in the phase-space generation algorithm.

Signal handling is done via a C interface to the `sigaction` system call. When a signal is raised that has been masked by the handler, the corresponding variable is set to the value of the signal. The variables are visible from the C signal handler.

The signal SIGINT is for keyboard interrupt (ctrl-C), SIGTERM is for system interrupt, e.g., at shutdown. The SIGXCPU and SIGXFSZ signals may be issued by batch systems.

```

⟨Diagnostics: public⟩+≡
public :: wo_sigint
public :: wo_sigterm
public :: wo_sigxcpu
public :: wo_sigxfsz

⟨Diagnostics: variables⟩+≡
integer(c_int), bind(C), volatile :: wo_sigint = 0
integer(c_int), bind(C), volatile :: wo_sigterm = 0
integer(c_int), bind(C), volatile :: wo_sigxcpu = 0
integer(c_int), bind(C), volatile :: wo_sigxfsz = 0

```

Here are the interfaces to the C functions. The routine `mask_term_signals` forces termination signals to be delayed. `release_term_signals` restores normal behavior. However, the program can be terminated anytime by calling `terminate_now_if_signal` which inspects the signals and terminates the program if requested..

```

⟨Diagnostics: public⟩+≡
public :: mask_term_signals

⟨Diagnostics: procedures⟩+≡
subroutine mask_term_signals ()

```

## 5.5 Operating-system interface

For specific purposes, we need direct access to the OS (system calls). This is, of course, system dependent. The current version is valid for GNU/Linux; we

expect to use a preprocessor for this module if different OSs are to be supported.

The current implementation lacks error handling.

```
(os_interface.f90)≡
  ⟨File header⟩

  module os_interface

    use, intrinsic :: iso_c_binding !NODEP!

    ⟨Use strings⟩
    use io_units
    use diagnostics
    use system_defs, only: DLERROR_LEN, ENVVAR_LEN
    use system_dependencies

    ⟨Standard module head⟩

    ⟨OS interface: public⟩

    ⟨OS interface: types⟩

    ⟨OS interface: interfaces⟩

    contains

    ⟨OS interface: procedures⟩

  end module os_interface
```

### 5.5.1 Path variables

This is a transparent container for storing user-defined path variables.

```
(OS interface: public)≡
  public :: paths_t

⟨OS interface: types)≡
  type :: paths_t
    type(string_t) :: prefix
    type(string_t) :: exec_prefix
    type(string_t) :: bindir
    type(string_t) :: libdir
    type(string_t) :: includedir
    type(string_t) :: datarootdir
    type(string_t) :: localprefix
    type(string_t) :: libtool
    type(string_t) :: lhapdfdir
  end type paths_t

⟨OS interface: public)+≡
  public :: paths_init

⟨OS interface: procedures)≡
  subroutine paths_init (paths)
    type(paths_t), intent(out) :: paths
```

```

paths%prefix = ""
paths%exec_prefix = ""
paths%bindir = ""
paths%libdir = ""
paths%includedir = ""
paths%datarootdir = ""
paths%localprefix = ""
paths%libtool = ""
paths%lhapdfdir = ""
end subroutine paths_init

```

### 5.5.2 System dependencies

We store all potentially system- and user/run-dependent data in a transparent container. This includes compiler/linker names and flags, file extensions, etc. There are actually two different possibilities for extensions of shared libraries, depending on whether the Fortran compiler or the system linker (usually the C compiler) has been used for linking. The default for the Fortran compiler on most systems is .so.

```

<OS interface: public>+≡
public :: os_data_t

<OS interface: types>+≡

### 5.5.3 Dynamic linking

We define a type that holds the filehandle for a dynamically linked library (shared object), together with functions to open and close the library, and to access functions in this library.

```

⟨OS interface: public⟩+≡
public :: dlaccess_t
⟨OS interface: types⟩+≡
type :: dlaccess_t
    private
    type(string_t) :: filename
    type(c_ptr) :: handle = c_null_ptr
    logical :: is_open = .false.
    logical :: has_error = .false.
    type(string_t) :: error
contains
⟨OS interface: dlaccess: TBP⟩
end type dlaccess_t

```

Output. This is called by the output routine for the process library.

```

⟨OS interface: dlaccess: TBP⟩≡
procedure :: write => dlaccess_write
⟨OS interface: procedures⟩+≡
subroutine dlaccess_write (object, unit)
    class(dlaccess_t), intent(in) :: object
    integer, intent(in) :: unit
    write (unit, "(1x,A)") "DL access info:"
    write (unit, "(3x,A,L1)") "is open  = ", object%is_open
    if (object%has_error) then
        write (unit, "(3x,A,A,A)") "error      = '", char (object%error), "'"
    else
        write (unit, "(3x,A)")      "error      = [none]"
    end if
end subroutine dlaccess_write

```

The interface to the library functions:

```
(OS interface: interfaces)≡
interface
    function dlopen (filename, flag) result (handle) bind(C)
        import
        character(c_char), dimension(*) :: filename
        integer(c_int), value :: flag
        type(c_ptr) :: handle
    end function dlopen
end interface

interface
    function dlclose (handle) result (status) bind(C)
        import
        type(c_ptr), value :: handle
        integer(c_int) :: status
    end function dlclose
end interface

interface
    function dlerror () result (str) bind(C)
        import
        type(c_ptr) :: str
    end function dlerror
end interface

interface
    function dlsym (handle, symbol) result (fptr) bind(C)
        import
        type(c_ptr), value :: handle
        character(c_char), dimension(*) :: symbol
        type(c_funptr) :: fptr
    end function dlsym
end interface
```

This reads an error string and transforms it into a `string_t` object, if an error has occurred. If not, set the error flag to false and return an empty string.

```
(System defs: public parameters)≡
integer, parameter, public :: DLERROR_LEN = 160

(OS interface: procedures)≡
subroutine read_dlerror (has_error, error)
    logical, intent(out) :: has_error
    type(string_t), intent(out) :: error
    type(c_ptr) :: err_cptr
    character(len=DLERROR_LEN, kind=c_char), pointer :: err_fptr
    integer :: str_end
    err_cptr = dlerror ()
    if (c_associated (err_cptr)) then
        call c_f_pointer (err_cptr, err_fptr)
        has_error = .true.
        str_end = scan (err_fptr, c_null_char)
        if (str_end > 0) then
            error = err_fptr(1:str_end-1)
```

```

        else
            error = err_fptr
        end if
    else
        has_error = .false.
        error = ""
    end if
end subroutine read_dlerror

```

This is the Fortran API. Init/final open and close the file, i.e., load and unload the library.

Note that a library can be opened more than once, and that for an ultimate close as many `dlclose` calls as `dlopen` calls are necessary. However, we assume that it is opened and closed only once.

```

<OS interface: public>+≡
public :: dlaccess_init
public :: dlaccess_final

<OS interface: dlaccess: TBP>+≡
procedure :: init => dlaccess_init
procedure :: final => dlaccess_final

<OS interface: procedures>+≡
subroutine dlaccess_init (dlaccess, prefix, libname, os_data)
    class(dlaccess_t), intent(out) :: dlaccess
    type(string_t), intent(in) :: prefix, libname
    type(os_data_t), intent(in), optional :: os_data
    type(string_t) :: filename
    logical :: exist
    dlaccess%filename = libname
    filename = prefix // "/" // libname
    inquire (file=char(filename), exist=exist)
    if (.not. exist) then
        filename = prefix // ".libs/" // libname
        inquire (file=char(filename), exist=exist)
        if (.not. exist) then
            dlaccess%has_error = .true.
            dlaccess%error = "Library '" // filename // "' not found"
            return
        end if
    end if
    dlaccess%handle = dlopen (char (filename) // c_null_char, ior ( &
        RTLD_LAZY, RTLD_LOCAL))
    dlaccess%is_open = c_associated (dlaccess%handle)
    call read_dlerror (dlaccess%has_error, dlaccess%error)
end subroutine dlaccess_init

subroutine dlaccess_final (dlaccess)
    class(dlaccess_t), intent(inout) :: dlaccess
    integer(c_int) :: status
    if (dlaccess%is_open) then
        status = dlclose (dlaccess%handle)
        dlaccess%is_open = .false.
        call read_dlerror (dlaccess%has_error, dlaccess%error)
    end if
end subroutine dlaccess_final

```

```

    end if
end subroutine dlaccess_final
```

Return true if an error has occurred.

```

⟨OS interface: public⟩+≡
public :: dlaccess_has_error

⟨OS interface: procedures⟩+≡
function dlaccess_has_error (dlaccess) result (flag)
    logical :: flag
    type(dlaccess_t), intent(in) :: dlaccess
    flag = dlaccess%has_error
end function dlaccess_has_error
```

Return the error string currently stored in the `dlaccess` object.

```

⟨OS interface: public⟩+≡
public :: dlaccess_get_error

⟨OS interface: procedures⟩+≡
function dlaccess_get_error (dlaccess) result (error)
    type(string_t) :: error
    type(dlaccess_t), intent(in) :: dlaccess
    error = dlaccess%error
end function dlaccess_get_error
```

The symbol handler returns the C address of the function with the given string name. (It is a good idea to use `bind(C)` for all functions accessed by this, such that the name string is well-defined.) Call `c_f_procpointer` to cast this into a Fortran procedure pointer with an appropriate interface.

```

⟨OS interface: public⟩+≡
public :: dlaccess_get_c_funptr

⟨OS interface: procedures⟩+≡
function dlaccess_get_c_funptr (dlaccess, fname) result (fptr)
    type(c_funptr) :: fptr
    type(dlaccess_t), intent(inout) :: dlaccess
    type(string_t), intent(in) :: fname
    fptr = dlsym (dlaccess%handle, char (fname) // c_null_char)
    call read_dlerror (dlaccess%has_error, dlaccess%error)
end function dlaccess_get_c_funptr
```

#### 5.5.4 Predicates

Return true if the library is loaded. In particular, this is false if loading was unsuccessful.

```

⟨OS interface: public⟩+≡
public :: dlaccess_is_open
```

```

⟨OS interface: procedures⟩+≡
    function dlaccess_is_open (dlaccess) result (flag)
        logical :: flag
        type(dlaccess_t), intent(in) :: dlaccess
        flag = dlaccess%is_open
    end function dlaccess_is_open

```

### 5.5.5 Shell access

This is the standard system call for executing a shell command, such as invoking a compiler.

In F2008 there will be the equivalent built-in command `execute_command_line`.

```

⟨OS interface: public⟩+≡
    public :: os_system_call

⟨OS interface: procedures⟩+≡
    subroutine os_system_call (command_string, status, verbose)
        type(string_t), intent(in) :: command_string
        integer, intent(out), optional :: status
        logical, intent(in), optional :: verbose
        logical :: verb
        integer :: stat
        verb = .false.; if (present(verbose)) verb = verbose
        if (verb) &
            call msg_message ("command: " // char(command_string))
        stat = system (char(command_string) // c_null_char)
        if (present(status)) then
            status = stat
        else if (stat /= 0) then
            if (.not. verb) &
                call msg_message ("command: " // char(command_string))
            write (msg_buffer, "(A,I0)") "Return code = ", stat
            call msg_message ()
            call msg_fatal ("System command returned with nonzero status code")
        end if
    end subroutine os_system_call

```

```

⟨OS interface: interfaces⟩+≡
    interface
        function system (command) result (status) bind(C)
            import
            integer(c_int) :: status
            character(c_char), dimension(*) :: command
        end function system
    end interface

```

### 5.5.6 Querying for a directory

This queries for the existence of a directory. There is no standard way to achieve this in FORTRAN, and if we were to call into `libc`, we would need access to C

macros for evaluating the result, so we resort to calling `test` as a system call.

```

⟨OS interface: public⟩+≡
  public :: os_dir_exist

⟨OS interface: procedures⟩+≡
  function os_dir_exist (name) result (res)
    type(string_t), intent(in) :: name
    logical :: res
    integer :: status
    call os_system_call ('test -d "' // name // "'", status=status)
    res = status == 0
  end function os_dir_exist

⟨OS interface: public⟩+≡
  public :: os_file_exist

⟨OS interface: procedures⟩+≡
  function os_file_exist (name) result (exist)
    type(string_t), intent(in) :: name
    ! logical, intent(in), optional :: verb
    logical :: exist
    ! integer :: status
    ! call os_system_call ('test -f "' // name // "'", status=status, verbose=verb)
    ! res = (status == 0)
    inquire (file = char (name), exist=exist)
  end function os_file_exist

```

### 5.5.7 Fortran compiler and linker

Compile a single module for use in a shared library, but without linking.

```

⟨OS interface: public⟩+≡
  public :: os_compile_shared

⟨OS interface: procedures⟩+≡
  subroutine os_compile_shared (src, os_data, status)
    type(string_t), intent(in) :: src
    type(os_data_t), intent(in) :: os_data
    integer, intent(out), optional :: status
    type(string_t) :: command_string
    if (os_data%use_libtool) then
      command_string = &
        os_data%whizard_libtool // " --mode=compile " // &
        os_data%fc // " " // &
        "-c " // &
        os_data%whizard_includes // " " // &
        os_data%fcflags // " " // &
       ("'" // src // os_data%fc_src_ext // "'"
    else
      command_string = &
        os_data%fc // " " // &
        "-c " // &
        os_data%fcflags_pic // " " // &
        os_data%whizard_includes // " " // &
        os_data%fcflags // " " // &

```

```

      "" // src // os_data%fc_src_ext // """
end if
call os_system_call (command_string, status)
end subroutine os_compile_shared

Link an array of object files to build a shared object library. In the libtool
case, we have to specify a -rpath, otherwise only a static library can be built.
However, since the library is never installed, this rpath is irrelevant.

<OS interface: public>+≡
public :: os_link_shared

<OS interface: procedures>+≡
subroutine os_link_shared (objlist, lib, os_data, status)
type(string_t), intent(in) :: objlist, lib
type(os_data_t), intent(in) :: os_data
integer, intent(out), optional :: status
type(string_t) :: command_string
if (os_data%use_libtool) then
    command_string = &
        os_data%whizard_libtool // " --mode=link " // &

### 5.5.8 Controlling OpenMP

OpenMP is handled automatically by the library for the most part. Here is a convenience routine for setting the number of threads, with some diagnostics.

```

<OS interface: public>+≡
public :: openmp_set_num_threads_verbose
<OS interface: procedures>+≡
subroutine openmp_set_num_threads_verbose (num_threads, openmp_logging)
    integer, intent(in) :: num_threads
    integer :: n_threads
    logical, intent(in), optional :: openmp_logging

```

```

logical :: logging
if (present (openmp_logging)) then
    logging = openmp_logging
else
    logging = .true.
end if
n_threads = num_threads
if (openmp_is_active ()) then
    if (num_threads == 1) then
        if (logging) then
            write (msg_buffer, "(A,I0,A)")  "OpenMP: Using ", num_threads, &
                " thread"
            call msg_message
        end if
        n_threads = num_threads
    else if (num_threads > 1) then
        if (logging) then
            write (msg_buffer, "(A,I0,A)")  "OpenMP: Using ", num_threads, &
                " threads"
            call msg_message
        end if
        n_threads = num_threads
    else
        if (logging) then
            write (msg_buffer, "(A,I0,A)")  "OpenMP: " &
                // "Illegal value of openmp_num_threads (", num_threads, &
                ") ignored"
            call msg_error
        end if
        n_threads = openmp_get_default_max_threads ()
        if (logging) then
            write (msg_buffer, "(A,I0,A)")  "OpenMP: Using ", &
                n_threads, " threads"
            call msg_message
        end if
    end if
    if (n_threads > openmp_get_default_max_threads ()) then

## 5.6 Interface for formatted I/O

For access to formatted printing (possibly input), we interface the C `printf` family of functions. There are two important issues here:

1. `printf` takes an arbitrary number of arguments, relying on the C stack. This is not interoperable. We interface it with C wrappers that output a single integer, real or string and restrict the allowed formats accordingly.
2. Restricting format strings is essential also for preventing format string attacks. Allowing arbitrary format string would create a real security hole in a Fortran program.
3. The string returned by `sprintf` must be allocated to the right size.

```

### 5.6.1 Parsing a C format string

The C format string contains characters and format conversion specifications. The latter are initiated by a % sign. If the next letter is also a %, a percent sign is printed and no conversion is done. Otherwise, a conversion is done and applied to the next argument in the argument list. First comes an optional flag (#, 0, -, +, or space), an optional field width (decimal digits starting not with zero), an optional precision (period, then another decimal digit string), a length modifier (irrelevant for us, therefore not supported), and a conversion specifier: d or i for integer; e, f, g (also upper case) for double-precision real, s for a string.

We explicitly exclude all other conversion specifiers, and we check the specifiers against the actual arguments.

#### A type for passing arguments

This is a polymorphic type that can hold integer, real (double), and string arguments.

```

⟨Formats: parameters⟩≡
integer, parameter, public :: ARGTYPE_NONE = 0
integer, parameter, public :: ARGTYPE_LOG = 1
integer, parameter, public :: ARGTYPE_INT = 2
integer, parameter, public :: ARGTYPE_REAL = 3
integer, parameter, public :: ARGTYPE_STR = 4

```

The integer and real entries are actually scalars, but we avoid relying on the allocatable-scalar feature and make them one-entry arrays. The character entry is a real array which is a copy of the string.

Logical values are mapped to strings (true or false), so this type parameter value is mostly unused.

```
(Formats: public)≡
    public :: sprintf_arg_t

(Formats: types)≡
    type :: sprintf_arg_t
        private
        integer :: type = ARGTYPE_NONE

    call msg_message ()
    call msg_error ("I/O error in sprintf call")
    actual_length = 0
  end if
end subroutine sprintf_arg_apply_sprintf

```

### Container type for the output

There is a procedure which chops the format string into pieces that contain at most one conversion specifier. Pairing this with a `sprintf_arg` object, we get the actual input to the `sprintf` interface. The type below holds this input and can allocate the output string.

```

⟨Formats: types⟩+≡
type :: sprintf_interface_t
  private
  character(c_char), dimension(:), allocatable :: input_fmt
  type(sprintf_arg_t) :: arg
  character(c_char), dimension(:), allocatable :: output_str
  integer :: output_str_len = 0
end type sprintf_interface_t

```

```

⟨Formats: procedures⟩+≡
subroutine sprintf_interface_init (intf, fmt, arg)
  type(sprintf_interface_t), intent(out) :: intf
  type(string_t), intent(in) :: fmt
  type(sprintf_arg_t), intent(in) :: arg
  integer :: fmt_len, i

```

```

fmt_len = len (fmt)
allocate (intf%input_fmt (fmt_len + 1))
do i = 1, fmt_len
    intf%input_fmt(i) = extract (fmt, i, i)
end do
intf%input_fmt(fmt_len+1) = c_null_char
intf%arg = arg
allocate (intf%output_str (len (fmt) + sprintf_arg_get_length (arg) + 1))
end subroutine sprintf_interface_init

```

*(Formats: procedures)*+≡

```

subroutine sprintf_interface_write (intf, unit)
type(sprintf_interface_t), intent(in) :: intf
integer, intent(in), optional :: unit
integer :: u
u = given_output_unit (unit)
write (u, *) "Format string = ", "", intf%input_fmt, ""

end subroutine sprintf_interface_apply_sprintf

```

Import the interfaces defined in the previous section:

*(Formats: interfaces)*+≡

*(sprintf interfaces)*

## Scan the format string

Chop it into pieces that contain one conversion specifier each. The zero-th piece contains the part before the first specifier. Check the specifiers and allow only the subset that we support. Also check for an exact match between conversion specifiers and input arguments. The result is an allocated array of `sprintf_interface` object; each one contains a piece of the format string and the corresponding argument.

```

## 5.7 CPU timing

The time is stored in a simple derived type which just holds a floating-point number.

```

⟨cputime.f90⟩≡
  ⟨File header⟩

  module cputime

    ⟨Use kinds⟩
      use io_units
    ⟨Use strings⟩
      use diagnostics

  ⟨Standard module head⟩

  ⟨CPU time: public⟩

  ⟨CPU time: types⟩

  ⟨CPU time: interfaces⟩

  contains

  ⟨CPU time: procedures⟩

```

```
  end module cputime
```

The CPU time is a floating-point number with an arbitrary reference time. It is single precision (default real, not `real(default)`). It is measured in seconds.

```

⟨CPU time: public⟩≡
  public :: time_t

⟨CPU time: types⟩≡
  type :: time_t
    private
    logical :: known = .false.
    real :: value = 0
  contains
    ⟨CPU time: time: TBP⟩
  end type time_t

⟨CPU time: time: TBP⟩≡
  procedure :: write => time_write

⟨CPU time: procedures⟩≡
  subroutine time_write (object, unit)
    class(time_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)
    write (u, "(1x,A)", advance="no") "Time in seconds ="
    if (object%known) then
      write (u, "(1x,ES10.3)") object%value
    else
      write (u, "(1x,A)") "[unknown]"
    end if
  end subroutine time_write

```

Set the current time

```
(CPU time: time: TBP)+≡
procedure :: set_current => time_set_current
```

*(CPU time: procedures)*+≡

```
subroutine time_set_current (time)
  class(time_t), intent(out) :: time
  integer :: msecs
  call system_clock (msecs)
  time%value = real (msecs) / 1000.
  time%known = time%value > 0
end subroutine time_set_current
```

Assign to a `real`(`default`) value. If the time is undefined, return zero.

```
(CPU time: public)+≡
public :: assignment(=)
```

*(CPU time: interfaces)*≡

```
interface assignment(=)
  module procedure real_assign_time
  module procedure real_default_assign_time
end interface
```

*(CPU time: procedures)*+≡

```
pure subroutine real_assign_time (r, time)
  real, intent(out) :: r
  class(time_t), intent(in) :: time
  if (time%known) then
    r = time%value
  else
    r = 0
  end if
end subroutine real_assign_time
```

```

  if (time%known) then
    r = time%value
  else
    r = 0
  end if
end subroutine real_default_assign_time
```

Assign an integer or (single precision) real value to the time object.

```
(CPU time: time: TBP)+≡
generic :: assignment(=) => time_assign_from_integer, time_assign_from_real
procedure, private :: time_assign_from_integer
procedure, private :: time_assign_from_real
```

*(CPU time: procedures)*+≡

```
subroutine time_assign_from_integer (time, ival)
  class(time_t), intent(out) :: time
  integer, intent(in) :: ival
```

```

        time%value = ival
        time%known = .true.
    end subroutine time_assign_from_integer

    subroutine time_assign_from_real (time, rval)
        class(time_t), intent(out) :: time
        real, intent(in) :: rval
        time%value = rval
        time%known = .true.
    end subroutine time_assign_from_real

```

Add times and compute time differences. If any input value is undefined, the result is undefined.

```

⟨CPU time: time: TBP⟩+≡
    generic :: operator(-) => subtract_times
    generic :: operator(+) => add_times
    procedure, private :: subtract_times
    procedure, private :: add_times

⟨CPU time: procedures⟩+≡
    pure function subtract_times (t_end, t_begin) result (time)
        type(time_t) :: time
        class(time_t), intent(in) :: t_end, t_begin
        if (t_end%known .and. t_begin%known) then
            time%known = .true.
            time%value = t_end%value - t_begin%value
        end if
    end function subtract_times

    pure function add_times (t1, t2) result (time)

```

```

    str = trim (buffer)
end function time_to_string_dhms

```

### 5.7.1 Timer

A timer can measure real (wallclock) time differences. The base type corresponds to the result, i.e., time difference. The object contains two further times for start and stop time.

```

<CPU time: public>+≡
  public :: timer_t

<CPU time: types>+≡
  type, extends (time_t) :: timer_t
  private
  logical :: running = .false.
  type(time_t) :: t1, t2
  contains
    <CPU time: timer: TBP>
end type timer_t

```

Output. If the timer is running, we indicate this, otherwise write just the result.

```

<CPU time: timer: TBP>≡
  procedure :: write => timer_write

<CPU time: procedures>+≡
  subroutine timer_write (object, unit)
    class(timer_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)
    if (object%running) then
      write (u, "(1x,A)") "Time in seconds = [running]"
    else
      call object%time_t%write (u)
    end if
  end subroutine timer_write

```

Start the timer: store the current time in the first entry and adapt the status. We forget any previous values.

```

<CPU time: timer: TBP>+≡
  procedure :: start => timer_start

<CPU time: procedures>+≡
  subroutine timer_start (timer)
    class(timer_t), intent(out) :: timer
    call timer%t1%set_current ()
    timer%running = .true.
  end subroutine timer_start

```

Restart the timer: simply adapt the status, keeping the start time.

```

<CPU time: timer: TBP>+≡
  procedure :: restart => timer_restart

```

```

⟨CPU time: procedures⟩+≡
    subroutine timer_restart (timer)
        class(timer_t), intent(inout) :: timer
        if (timer%t1%known .and. .not. timer%running) then
            timer%running = .true.
        else
            call msg_bug ("Timer: restart attempt from wrong status")
        end if
    end subroutine timer_restart

```

Stop the timer: store the current time in the second entry, adapt the status, and compute the elapsed time.

```

⟨CPU time: timer: TBP⟩+≡
    procedure :: stop => timer_stop

```

### 5.7.2 Unit tests

Test module, followed by the corresponding implementation module.

```
(cputime_ut.f90)≡
  ⟨File header⟩

  module cputime_ut
    use unit_tests
    use cputime_uti

    ⟨Standard module head⟩

    ⟨CPU time: public test⟩

    contains

    ⟨CPU time: test driver⟩

    end module cputime_ut

(cputime_uti.f90)≡
  ⟨File header⟩

  module cputime_uti

    ⟨Use strings⟩

    use cputime

    ⟨Standard module head⟩

    ⟨CPU time: test declarations⟩

    contains

    ⟨CPU time: tests⟩

    end module cputime_uti

API: driver for the unit tests below.

⟨CPU time: public test⟩≡
  public :: cputime_test

⟨CPU time: test driver⟩≡
  subroutine cputime_test (u, results)
    integer, intent(in) :: u
    type(test_results_t), intent(inout) :: results
  ⟨CPU time: execute tests⟩
  end subroutine cputime_test
```

#### Basic tests

Check basic functions of the time object. The part which we can't check is getting the actual time from the system clock, since the output will not be

reproducible. However, we can check time formats and operations.

```
(CPU time: execute tests)≡
  call test (cputime_1, "cputime_1", &
             "time operations", &
             u, results)

(CPU time: test declarations)≡
  public :: cputime_1

(CPU time: tests)≡
  subroutine cputime_1 (u)
    integer, intent(in) :: u
    type(time_t) :: time, time1, time2
    real :: t
    integer :: d, h, m, s

    write (u, "(A)")  "* Test output: cputime_1"
    write (u, "(A)")  "* Purpose: check time operations"
    write (u, "(A)")

    write (u, "(A)")  "* Undefined time"
    write (u, *)

    call time%write (u)

    write (u, *)
    write (u, "(A)")  "* Set time to zero"
    write (u, *)

    time = 0
    call time%write (u)

    write (u, *)
    write (u, "(A)")  "* Set time to 1.234 s"
    write (u, *)

    time = 1.234
    call time%write (u)

    t = time
    write (u, "(1x,A,F6.3)")  "Time as real =", t

    write (u, *)
    write (u, "(A)")  "* Compute time difference"
    write (u, *)

    time1 = 5.33
    time2 = 7.55
    time = time2 - time1

        write (u, "(A)")    "* Stop timer again (injecting fake timing)"
        write (u, *)

        call timer%stop ()
        call timer%set_test_time2 (10)
```

```
call timer%evaluate ()
call timer%write (u)

write (u, *)
write (u, "(A)")  "* Test output end: cputime_2"

end subroutine cputime_2
```

# Chapter 6

## Combinatorics

These modules implement standard algorithms (sorting, hashing, etc.) that are not available in Fortran.

Fortran doesn't support generic programming, therefore the algorithms are implemented only for specific data types.

**bytes** Derived types for bytes and words.

**hashes** Types and tools for setting up hashtables.

**md5** The MD5 algorithm for message digest.

**permutations** Permuting an array of integers.

**sorting** Sorting integer and real values.

**grids**  $d$ -dimensional grids can be saved to disk and used for interpolation, maximum finding, etc.

### 6.1 Bytes and such

In a few instances we will need the notion of a byte (8-bit) and a word (32 bit), even a 64-bit word. A block of 512 bit is also needed (for MD5).

We rely on integers up to 64 bit being supported by the processor. The main difference to standard integers is the interpretation as unsigned integers.

```
(bytes.f90)≡
<File header>

module bytes

use kinds, only: i8, i32, i64
use io_units

<Standard module head>

<Bytes: public>

<Bytes: types>
```

```
{Bytes: parameters}
```

```
{Bytes: interfaces}
```

```
contains
```

```
{Bytes: procedures}
```

```
end module bytes
```

### 6.1.1 8-bit words: bytes

This is essentially a wrapper around 8-bit integers. The wrapper emphasises their special interpretation as a sequence of bits. However, we interpret bytes as unsigned integers.

```
{Bytes: public}≡  
public :: byte_t
```

```
{Bytes: types}≡  
type :: byte_t  
    private  
    integer(i8) :: i  
end type byte_t
```

```
{Bytes: public}+≡  
public :: byte_zero
```

```
{Bytes: parameters}≡  
type(byte_t), parameter :: byte_zero = byte_t (0_i8)
```

Set a byte from 8-bit integer:

```
{Bytes: public}+≡  
public :: assignment(=)
```

```
{Bytes: interfaces}≡  
interface assignment(=)  
    module procedure set_byte_from_i8  
end interface
```

```
{Bytes: procedures}≡  
subroutine set_byte_from_i8 (b, i)  
    type(byte_t), intent(out) :: b  
    integer(i8), intent(in) :: i  
    b%i = i  
end subroutine set_byte_from_i8
```

Write a byte in one of two formats: either as a hexadecimal number (two digits, default) or as a decimal number (one to three digits). The decimal version is nontrivial because bytes are unsigned integers. Optionally append a newline.

```
{Bytes: public}+≡  
public :: byte_write
```

```

⟨Bytes: interfaces⟩+≡
  interface byte_write
    module procedure byte_write_unit, byte_write_string
  end interface

⟨Bytes: procedures⟩+≡
  subroutine byte_write_unit (b, unit, decimal, newline)
    type(byte_t), intent(in), optional :: b
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: decimal, newline
    logical :: dc, nl
    type(word32_t) :: w
    integer :: u
    u = given_output_unit (unit);  if (u < 0)  return
    dc = .false.;  if (present (decimal))  dc = decimal
    nl = .false.;  if (present (newline))  nl = newline
    if (dc) then
      w = b
      write (u, '(I3)', advance='no')  w%i
    else
      write (u, '(z2.2)', advance='no')  b%i
    end if
    if (nl) write (u, *)
  end subroutine byte_write_unit

```

The string version is hex-only

```

⟨Bytes: procedures⟩+≡
  subroutine byte_write_string (b, s)
    type(byte_t), intent(in) :: b
    character(len=2), intent(inout) :: s
    write (s, '(z2.2)')  b%i
  end subroutine byte_write_string

```

### 6.1.2 32-bit words

This is not exactly a 32-bit integer. A word is to be filled with bytes, and it may be partially filled. The filling is done lowest-byte first, highest-byte last. We count the bits, so `fill` should be either 0, 8, 16, 24, or 32. In printing words, we correspondingly distinguish between printing zeros and printing blanks.

```

⟨Bytes: public⟩+≡
  public :: word32_t

⟨Bytes: types⟩+≡
  type :: word32_t
    private
    integer(i32) :: i
    integer :: fill = 0
  end type word32_t

```

Assignment: the word is filled by inserting a 32-bit integer

```

⟨Bytes: interfaces⟩+≡
  interface assignment(=)

```

```

    module procedure word32_set_from_i32
    module procedure word32_set_from_byte
end interface

⟨Bytes: procedures⟩+≡
    subroutine word32_set_from_i32 (w, i)
        type(word32_t), intent(out) :: w
        integer(i32), intent(in) :: i
        w%i = i
        w%fill = 32
    end subroutine word32_set_from_i32

```

Reverse assignment to a 32-bit integer. We do not check the fill status.

```

⟨Bytes: interfaces⟩+≡
    interface assignment(=)
        module procedure i32_from_word32
    end interface

⟨Bytes: procedures⟩+≡
    subroutine i32_from_word32 (i, w)
        integer(i32), intent(out) :: i
        type(word32_t), intent(in) :: w
        i = w%i
    end subroutine i32_from_word32

```

Filling with a 8-bit integer is slightly tricky, because in this interpretation integers are unsigned.

```

⟨Bytes: procedures⟩+≡
    subroutine word32_set_from_byte (w, b)
        type(word32_t), intent(out) :: w
        type(byte_t), intent(in) :: b
        if (b%i >= 0_i8) then
            w%i = b%i
        else
            w%i = 2_i32*(huge(0_i8)+1_i32) + b%i
        end if
        w%fill = 32
    end subroutine word32_set_from_byte

```

Check the fill status

```

⟨Bytes: public⟩+≡
    public :: word32_empty, word32_filled, word32_fill

⟨Bytes: procedures⟩+≡
    function word32_empty (w)
        type(word32_t), intent(in) :: w
        logical :: word32_empty
        word32_empty = (w%fill == 0)
    end function word32_empty

    function word32_filled (w)
        type(word32_t), intent(in) :: w
        logical :: word32_filled
        word32_filled = (w%fill == 32)
    end function word32_filled

```

```

end function word32_filled

function word32_fill (w)
    type(word32_t), intent(in) :: w
    integer :: word32_fill
    word32_fill = w%fill
end function word32_fill

<Bytes: public>+≡
public :: word32_append_byte

<Bytes: procedures>+≡
subroutine word32_append_byte (w, b)
    type(word32_t), intent(inout) :: w
    type(byte_t), intent(in) :: b
    type(word32_t) :: w1
    if (.not. word32_filled (w)) then
        w1 = b
        call mvbits (w1%i, 0, 8, w%i, w%fill)
        w%fill = w%fill + 8
    end if
end subroutine word32_append_byte

```

Extract a byte from a word. The argument *i* is the position, which may be 0, 1, 2, or 3.

For the final assignment, we set the highest bit separately. Otherwise, we might trigger an overflow condition for a compiler with strict checking turned on.

```

<Bytes: public>+≡
public :: byte_from_word32

<Bytes: procedures>+≡
function byte_from_word32 (w, i) result (b)
    type(word32_t), intent(in) :: w
    integer, intent(in) :: i
    type(byte_t) :: b
    integer(i32) :: j
    j = 0
    if (i >= 0 .and. i*8 < w%fill) then
        call mvbits (w%i, i*8, 8, j, 0)
    end if
    b%i = int (ibclr (j, 7), kind=i8)
    if (btest (j, 7)) b%i = ibset (b%i, 7)
end function byte_from_word32

```

Write a word to file or STDOUT. We understand words as unsigned integers, therefore we cannot use the built-in routine unchanged. However, we can make use of the existence of 64-bit integers and their output routine.

In hexadecimal format, the default version prints eight hex characters, highest-first. The **bytes** version prints four bytes (two-hex characters), lowest first, with

spaces in-between. The decimal bytes version is analogous. In the `bytes` version, missing bytes are printed as whitespace.

```

⟨Bytes: public⟩+≡
    public :: word32_write

⟨Bytes: interfaces⟩+≡
    interface word32_write
        module procedure word32_write_unit
    end interface

⟨Bytes: procedures⟩+≡
    subroutine word32_write_unit (w, unit, bytes, decimal, newline)
        type(word32_t), intent(in) :: w
        integer, intent(in), optional :: unit
        logical, intent(in), optional :: bytes, decimal, newline
        logical :: dc, by, nl
        type(word64_t) :: ww
        integer :: i, u
        u = given_output_unit (unit);  if (u < 0)  return
        by = .false.;  if (present (bytes))  by = bytes
        dc = .false.;  if (present (decimal)) dc = decimal
        nl = .false.;  if (present (newline)) nl = newline
        if (by) then
            do i = 0, 3
                if (i>0)  write (u, '(1x)', advance='no')
                if (8*i < w%fill) then
                    call byte_write (byte_from_word32 (w, i), unit, decimal=decimal)
                else if (dc) then
                    write (u, '(3x)', advance='no')
                else
                    write (u, '(2x)', advance='no')
                end if
            end do
        else if (dc) then
            ww = w
            write (u, '(I10)', advance='no') ww%i
        else
            select case (w%fill)
            case ( 0)
            case ( 8);  write (6, '(1x,z8.2)', advance='no') ibits (w%i, 0, 8)
            case (16);  write (6, '(1x,z8.4)', advance='no') ibits (w%i, 0,16)
            case (24);  write (6, '(1x,z8.6)', advance='no') ibits (w%i, 0,24)
            case (32);  write (6, '(1x,z8.8)', advance='no') ibits (w%i, 0,32)
            end select
        end if
        if (nl) write (u, *)
    end subroutine word32_write_unit

```

### 6.1.3 Operations on 32-bit words

Define the usual logical operations, as well as addition ( $\text{mod } 2^{32}$ ). We assume that all operands are completely filled.

⟨Bytes: public⟩+≡

```

public :: not, ior, ieor, iand, ishft, ishftc
⟨Bytes: interfaces⟩+≡
  interface not
    module procedure word_not
  end interface
  interface ior
    module procedure word_or
  end interface
  interface ieor
    module procedure word_eor
  end interface
  interface iand
    module procedure word_and
  end interface
  interface ishft
    module procedure word_shft
  end interface
  interface ishftc
    module procedure word_shftc
  end interface

⟨Bytes: procedures⟩+≡
  function word_not (w1) result (w2)
    type(word32_t), intent(in) :: w1
    type(word32_t) :: w2
    w2 = not (w1%i)
  end function word_not

  function word_or (w1, w2) result (w3)
    type(word32_t), intent(in) :: w1, w2
    type(word32_t) :: w3
    w3 = ior (w1%i, w2%i)
  end function word_or

  function word_eor (w1, w2) result (w3)
    type(word32_t), intent(in) :: w1, w2

    w3 = ieor (w1%i, w2%i)
  end function word_eor

  function word_and (w1, w2) result (w3)
    type(word32_t), intent(in) :: w1, w2
    type(word32_t) :: w3
    w3 = iand (w1%i, w2%i)
  end function word_and

  function word_shft (w1, s) result (w2)
    type(word32_t), intent(in) :: w1
    integer, intent(in) :: s
    type(word32_t) :: w2
    w2 = ishft (w1%i, s)
  end function word_shft

  function word_shftc (w1, s) result (w2)

```

```

type(word32_t), intent(in) :: w1
integer, intent(in) :: s
type(word32_t) :: w2
w2 = ishftc (w1%i, s, 32)
end function word_shftc

Addition is defined mod  $2^{32}$ , i.e., without overflow checking. This means that we have to work around a possible overflow check enforced by the compiler.

  end if
end function word_add_i32

```

```

    end if
end function word_add_i32
```

### 6.1.4 64-bit words

These objects consist of two 32-bit words. They thus can hold integer numbers larger than  $2^{32}$  (to be exact,  $2^{31}$  since FORTRAN integers are signed). The order is low-word, high-word.

```

⟨Bytes: public⟩+≡
public :: word64_t

⟨Bytes: types⟩+≡
type :: word64_t
private
integer(i64) :: i
end type word64_t
```

Set a 64 bit word:

```

⟨Bytes: interfaces⟩+≡
interface assignment(=)
module procedure word64_set_from_i64
module procedure word64_set_from_word32
end interface

⟨Bytes: procedures⟩+≡
subroutine word64_set_from_i64 (ww, i)
type(word64_t), intent(out) :: ww
integer(i64), intent(in) :: i
ww%i = i
end subroutine word64_set_from_i64
```

Filling with a 32-bit word:

```

⟨Bytes: procedures⟩+≡
subroutine word64_set_from_word32 (ww, w)
type(word64_t), intent(out) :: ww
type(word32_t), intent(in) :: w
if (w%i >= 0_i32) then
ww%i = w%i
else
ww%i = 2_i64*(huge(0_i32)+1_i64) + w%i
end if
end subroutine word64_set_from_word32
```

Extract a byte from a word. The argument *i* is the position, which may be between 0 and 7.

For the final assignment, we set the highest bit separately. Otherwise, we might trigger an overflow condition for a compiler with strict checking turned on.

```

⟨Bytes: public⟩+≡
public :: byte_from_word64, word32_from_word64
```

```

⟨Bytes: procedures⟩+≡
    function byte_from_word64 (ww, i) result (b)
        type(word64_t), intent(in) :: ww
        integer, intent(in) :: i
        type(byte_t) :: b
        integer(i64) :: j
        j = 0
        if (i >= 0 .and. i*8 < 64) then
            call mvbits (ww%i, i*8, 8, j, 0)
        end if
        b%i = int (ibclr (j, 7), kind=i8)
        if (btest (j, 7)) b%i = ibset (b%i, 7)
    end function byte_from_word64

```

Extract a 32-bit word from a 64-bit word. The position is either 0 or 1.

```

⟨Bytes: procedures⟩+≡
    function word32_from_word64 (ww, i) result (w)
        type(word64_t), intent(in) :: ww
        integer, intent(in) :: i
        type(word32_t) :: w
        integer(i64) :: j
        j = 0
        select case (i)
        case (0); call mvbits (ww%i, 0, 32, j, 0)
        case (1); call mvbits (ww%i, 32, 32, j, 0)
        end select
        w = int (ibclr (j, 31), kind=i32)
        if (btest (j, 31)) w = ibset (w%i, 31)
    end function word32_from_word64

```

Print a 64-bit word. Decimal version works up to  $2^{63}$ . The **words** version uses the 'word32' printout, separated by two spaces. The low-word is printed first. The **bytes** version also uses the 'word32' printout. This implies that the lowest byte is first. The default version prints a hexadecimal number without spaces, highest byte first.

```

⟨Bytes: public⟩+≡
    public :: word64_write
    ⟨Bytes: interfaces⟩+≡
        interface word64_write
            module procedure word64_write_unit
        end interface
    ⟨Bytes: procedures⟩+≡
        subroutine word64_write_unit (ww, unit, words, bytes, decimal, newline)
            type(word64_t), intent(in) :: ww
            integer, intent(in), optional :: unit
            logical, intent(in), optional :: words, bytes, decimal, newline
            logical :: wo, by, dc, nl
            integer :: u
            u = given_output_unit (unit); if (u < 0) return
            wo = .false.; if (present (words)) wo = words
            by = .false.; if (present (bytes)) by = bytes
            dc = .false.; if (present (decimal)) dc = decimal

```

```

nl = .false.;  if (present (newline))  nl = newline
if (wo .or. by) then
    call word32_write_unit (word32_from_word64 (ww, 0), unit, by, dc)
    write (u, '(2x)', advance='no')
    call word32_write_unit (word32_from_word64 (ww, 1), unit, by, dc)
else if (dc) then
    write (u, '(I19)', advance='no') ww%i
else
    write (u, '(Z16)', advance='no') ww%i
end if
if (nl) write (u, *)
end subroutine word64_write_unit

```

## 6.2 Hashtables

Hash tables, like lists, are not part of Fortran and must be defined on a per-case basis. In this section we define a module that contains a hash function.

Furthermore, for reference there is a complete framework of hashtable type definitions and access functions. This code is to be replicated where hash tables are used, mutatis mutandis.

```

<hashes.f90>≡
<File header>

module hashes

use kinds, only: i8, i32
use bytes

<Standard module head>

<Hashes: public>

contains

<Hashes: procedures>

end module hashes

```

### 6.2.1 The hash function

This is the one-at-a-time hash function by Bob Jenkins (from Wikipedia), re-implemented in Fortran. The function works on an array of bytes (8-bit integers), as could be produced by, e.g., the `transfer` function, and returns a single 32-bit integer. For determining the position in a hashtable, one can pick the lower bits of the result as appropriate to the hashtable size (which should be a power of 2). Note that we are working on signed integers, so the interpretation of values differs from the C version. This should not matter in practice, however.

```

<Hashes: public>≡
public :: hash

```

```

(Hashes: procedures)≡
    function hash (key) result (hashval)
        integer(i32) :: hashval
        integer(i8), dimension(:), intent(in) :: key
        type(word32_t) :: w
        integer :: i
        w = 0_i32
        do i = 1, size (key)
            w = w + key(i)
            w = w + ishft (w, 10)
            w = ieor (w, ishft (w, -6))
        end do
        w = w + ishft (w, 3)
        w = ieor (w, ishft (w, -11))
        w = w + ishft (w, 15)
        hashval = w
    end function hash

```

### 6.2.2 The hash table

We define a generic hashtable type (that depends on the `hash_data_t` type) together with associated methods.

This is a template:

```

(Hashtables: types)≡
    type :: hash_data_t
        integer :: i
    end type hash_data_t

```

Associated methods:

```

(Hashtables: procedures)≡
    subroutine hash_data_final (data)
        type(hash_data_t), intent(inout) :: data
    end subroutine hash_data_final

    subroutine hash_data_write (data, unit)
        type(hash_data_t), intent(in) :: data
        integer, intent(in), optional :: unit
        integer :: u
        u = given_output_unit (unit); if (u < 0) return
        write (u, *) data%i
    end subroutine hash_data_write

```

Each hash entry stores the unmasked hash value, the key, and points to actual data if present. Note that this could be an allocatable scalar in principle, but making it a pointer avoids deep copy when expanding the hashtable.

```

(Hashtables: types)+≡
    type :: hash_entry_t
        integer(i32) :: hashval = 0
        integer(i8), dimension(:), allocatable :: key
        type(hash_data_t), pointer :: data => null ()
    end type hash_entry_t

```

The hashtable object holds the actual table, the number of filled entries and the number of entries after which the size should be doubled. The mask is equal to the table size minus one and thus coincides with the upper bound of the table index, which starts at zero.

```
<Hashtables: types>+≡
  type :: hashtable_t
    integer :: n_entries = 0
    real :: fill_ratio = 0
    integer :: n_entries_max = 0
    integer(i32) :: mask = 0
    type(hash_entry_t), dimension(:), allocatable :: entry
  end type hashtable_t
```

Initializer: The size has to be a power of two, the fill ratio is a real (machine-default!) number between 0 and 1.

```
<Hashtables: procedures>+≡
  subroutine hashtable_init (hashtable, size, fill_ratio)
    type(hashtable_t), intent(out) :: hashtable
    integer, intent(in) :: size
    real, intent(in) :: fill_ratio
    hashtable%fill_ratio = fill_ratio
    hashtable%n_entries_max = size * fill_ratio
    hashtable%mask = size - 1
    allocate (hashtable%entry (0:hashtable%mask))
  end subroutine hashtable_init
```

Finalizer: This calls a hash\_data\_final subroutine which must exist.

```
<Hashtables: procedures>+≡
  subroutine hashtable_final (hashtable)
    type(hashtable_t), intent(inout) :: hashtable
    integer :: i
    do i = 0, hashtable%mask
      if (associated (hashtable%entry(i)%data)) then
        call hash_data_final (hashtable%entry(i)%data)
        deallocate (hashtable%entry(i)%data)
      end if
    end do
    deallocate (hashtable%entry)
  end subroutine hashtable_final
```

Output. Here, we refer to a hash\_data\_write subroutine.

```
<Hashtables: procedures>+≡
  subroutine hashtable_write (hashtable, unit)
    type(hashtable_t), intent(in) :: hashtable
    integer, intent(in), optional :: unit
    integer :: u, i
    u = given_output_unit (unit);  if (u < 0)  return
    do i = 0, hashtable%mask
      if (associated (hashtable%entry(i)%data)) then
        write (u, *) i, "(hash =", hashtable%entry(i)%hashval, ")",
    
```

```

        hashtable%entry(i)%key
        call hash_data_write (hashtable%entry(i)%data, unit)
    end if
end do
end subroutine hashtable_write

```

### 6.2.3 Hashtable insertion

Insert a single entry with the hash value as trial place. If the table is filled, first expand it.

```

<Hashtables: procedures>+≡
subroutine hashtable_insert (hashtable, key, data)
    type(hashtable_t), intent(inout) :: hashtable
    integer(i8), dimension(:), intent(in) :: key
    type(hash_data_t), intent(in), target :: data
    integer(i32) :: h
    if (hashtable%n_entries >= hashtable%n_entries_max) &
        call hashtable_expand (hashtable)
    h = hash (key)
    call hashtable_insert_rec (hashtable, h, h, key, data)
end subroutine hashtable_insert

```

We need this auxiliary routine for doubling the size of the hashtable. We rely on the fact that default assignment copies the data pointer, not the data themselves. The temporary array must not be finalized; it is deallocated automatically together with its allocatable components.

```

<Hashtables: procedures>+≡
subroutine hashtable_expand (hashtable)
    type(hashtable_t), intent(inout) :: hashtable
    type(hash_entry_t), dimension(:), allocatable :: table_tmp
    integer :: i, s
    allocate (table_tmp (0:hashtable%mask))
    table_tmp = hashtable%entry
    deallocate (hashtable%entry)
    s = 2 * size (table_tmp)
    hashtable%n_entries = 0
    hashtable%n_entries_max = s * hashtable%fill_ratio
    hashtable%mask = s - 1
    allocate (hashtable%entry (0:hashtable%mask))
    do i = 0, ubound (table_tmp, 1)
        if (associated (table_tmp(i)%data)) then
            call hashtable_insert_rec (hashtable, table_tmp(i)%hashval, &
                table_tmp(i)%hashval, table_tmp(i)%key, table_tmp(i)%data)
        end if
    end do
end subroutine hashtable_expand

```

Insert a single entry at a trial place  $h$ , reduced to the table size. Collision resolution is done simply by choosing the next element, recursively until the place is empty. For bookkeeping, we preserve the original hash value. For a good hash function, there should be no clustering.

Note that if the new key exactly matches an existing key, nothing is done.

```
<Hashtables: procedures>+≡
recursive subroutine hashtable_insert_rec (hashtable, h, hashval, key, data)
    type(hashtable_t), intent(inout) :: hashtable
    integer(i32), intent(in) :: h, hashval
    integer(i8), dimension(:), intent(in) :: key
    type(hash_data_t), intent(in), target :: data
    integer(i32) :: i
    i = iand (h, hashtable%mask)
    if (associated (hashtable%entry(i)%data)) then
        if (size (hashtable%entry(i)%key) /= size (key)) then
            call hashtable_insert_rec (hashtable, h + 1, hashval, key, data)
        else if (any (hashtable%entry(i)%key /= key)) then
            call hashtable_insert_rec (hashtable, h + 1, hashval, key, data)
        end if
    else
        hashtable%entry(i)%hashval = hashval
        allocate (hashtable%entry(i)%key (size (key)))
        hashtable%entry(i)%key = key
        hashtable%entry(i)%data => data
        hashtable%n_entries = hashtable%n_entries + 1
    end if
end subroutine hashtable_insert_rec
```

#### 6.2.4 Hashtable lookup

The lookup function has to parallel the insert function. If the place is filled, check if the key matches. Yes: return the pointer; no: increment the hash value and check again.

```
<Hashtables: procedures>+≡
function hashtable_lookup (hashtable, key) result (ptr)
    type(hash_data_t), pointer :: ptr
    type(hashtable_t), intent(in) :: hashtable
    integer(i8), dimension(:), intent(in) :: key
    ptr => hashtable_lookup_rec (hashtable, hash (key), key)
end function hashtable_lookup

<Hashtables: procedures>+≡
recursive function hashtable_lookup_rec (hashtable, h, key) result (ptr)
    type(hash_data_t), pointer :: ptr
    type(hashtable_t), intent(in) :: hashtable
    integer(i32), intent(in) :: h
    integer(i8), dimension(:), intent(in) :: key
    integer(i32) :: i
    i = iand (h, hashtable%mask)
    if (associated (hashtable%entry(i)%data)) then
        if (size (hashtable%entry(i)%key) == size (key)) then
            if (all (hashtable%entry(i)%key == key)) then
                ptr => hashtable%entry(i)%data
            else
                ptr => hashtable_lookup_rec (hashtable, h + 1, key)
            end if
        end if
    end if
```

```

        else
            ptr => hashtable_lookup_rec (hashtable, h + 1, key)
        end if
    else
        ptr => null ()
    end if
end function hashtable_lookup_rec

⟨Hashtables: public⟩≡
public :: hashtable_test
⟨Hashtables: procedures⟩+≡
subroutine hashtable_test ()
    type(hash_data_t), pointer :: data
    type(hashtable_t) :: hashtable
    integer(i8) :: i
    call hashtable_init (hashtable, 16, 0.25)
    do i = 1, 10
        allocate (data)
        data%i = i*i
        call hashtable_insert (hashtable, [i, i+i], data)
    end do
    call hashtable_insert (hashtable, [2_i8, 4_i8], data)
    call hashtable_write (hashtable)
    data => hashtable_lookup (hashtable, [5_i8, 10_i8])
    if (associated (data)) then
        print *, "lookup:", data%i
    else
        print *, "lookup: --"
    end if
    data => hashtable_lookup (hashtable, [6_i8, 12_i8])
    if (associated (data)) then
        print *, "lookup:", data%i
    else
        print *, "lookup: --"
    end if
    data => hashtable_lookup (hashtable, [4_i8, 9_i8])
    if (associated (data)) then
        print *, "lookup:", data%i
    else
        print *, "lookup: --"
    end if
    call hashtable_final (hashtable)
end subroutine hashtable_test

```

### 6.3 MD5 Checksums

Implementing MD5 checksums allows us to check input/file integrity on the basis of a well-known standard. The building blocks have been introduced in the `bytes` module.

⟨md5.f90⟩≡

```

⟨File header⟩

module md5

use kinds, only: i8, i32, i64
use io_units
use unit_tests
use system_defs, only: BUFFER_SIZE
use system_defs, only: LF, EOR, EOF
use diagnostics
use bytes

⟨Standard module head⟩

⟨MD5: public⟩

⟨MD5: types⟩

⟨MD5: variables⟩

⟨MD5: interfaces⟩

contains

⟨MD5: procedures⟩

end module md5

```

### 6.3.1 Blocks

A block is a sequence of 16 words (64 bytes or 512 bits). We anticipate that blocks will be linked, so include a pointer to the next block. There is a fill status (word counter), as there is one for each word. The fill status is equal to the number of bytes that are in, so it may be between 0 and 64.

```

⟨MD5: types⟩≡
type :: block_t
    private
        type(word32_t), dimension(0:15) :: w
        type(block_t), pointer :: next => null ()
        integer :: fill = 0
    end type block_t

```

Check if a block is completely filled or empty:

```

⟨MD5: procedures⟩≡
function block_is_empty (b)
    type(block_t), intent(in) :: b
    logical :: block_is_empty
    block_is_empty = (b%fill == 0 .and. word32_empty (b%w(0)))
end function block_is_empty

function block_is_filled (b)
    type(block_t), intent(in) :: b
    logical :: block_is_filled

```

```

block_is_filled = (b%fill == 64)
end function block_is_filled

```

Append a single byte to a block. Works only if the block is not yet filled.

```

⟨MD5: procedures⟩+≡
subroutine block_append_byte (bl, by)
  type(block_t), intent(inout) :: bl
  type(byte_t), intent(in) :: by
  if (.not. block_is_filled (bl)) then
    call word32_append_byte (bl%w(bl%fill/4), by)
    bl%fill = bl%fill + 1
  end if
end subroutine block_append_byte

```

The printing routine allows for printing as sequences of words or bytes, decimal or hex.

```

⟨MD5: interfaces⟩≡
interface block_write
  module procedure block_write_unit
end interface

⟨MD5: procedures⟩+≡
subroutine block_write_unit (b, unit, bytes, decimal)
  type(block_t), intent(in) :: b
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: bytes, decimal
  logical :: by, dc
  integer :: i, u
  u = given_output_unit (unit);  if (u < 0)  return
  by = .false.;  if (present (bytes))  by = bytes
  dc = .false.;  if (present (decimal))  dc = decimal
  do i = 0, b%fill/4 - 1
    call newline_or_blank (u, i, by, dc)
    call word32_write (b%w(i), unit, bytes, decimal)
  end do
  if (.not. block_is_filled (b)) then
    i = b%fill/4
    if (.not. word32_empty (b%w(i))) then
      call newline_or_blank (u, i, by, dc)
      call word32_write (b%w(i), unit, bytes, decimal)
    end if
  end if
  write (u, *)
contains
  subroutine newline_or_blank (u, i, bytes, decimal)
    integer, intent(in) :: u, i
    logical, intent(in) :: bytes, decimal
    if (decimal) then
      select case (i)
        case (0)
        case (2,4,6,8,10,12,14);  write (u, *)
        case default
          write (u, '(2x)', advance='no')
    end if
  end subroutine

```

```

        end select
    else if (bytes) then
        select case (i)
        case (0)
        case (4,8,12);  write (u, *)
        case default
            write (u, '(2x)', advance='no')
        end select
    else
        if (i == 8)  write (u, *)
    end if
end subroutine newline_or_blank
end subroutine block_write_unit

```

### 6.3.2 Messages

A message (within this module) is a linked list of blocks.

*(MD5: types)*+≡

```

type :: message_t
private
type(block_t), pointer :: first => null ()
type(block_t), pointer :: last => null ()
integer :: n_blocks = 0
end type message_t

```

Clear the message list

*(MD5: procedures)*+≡

```

subroutine message_clear (m)
type(message_t), intent(inout) :: m
type(block_t), pointer :: b
nullify (m%last)
do
    b => m%first
    if (.not.(associated (b))) exit
    m%first => b%next
    deallocate (b)
end do
m%n_blocks = 0
end subroutine message_clear

```

Append an empty block to the message list

*(MD5: procedures)*+≡

```

subroutine message_append_new_block (m)
type(message_t), intent(inout) :: m
if (associated (m%last)) then
    allocate (m%last%next)
    m%last => m%last%next
    m%n_blocks = m%n_blocks + 1
else
    allocate (m%first)
    m%last => m%first

```

```

    m%n_blocks = 1
end if
end subroutine message_append_new_block

```

Initialize: clear and allocate the first (empty) block.

```

⟨MD5: procedures⟩+≡
subroutine message_init (m)
type(message_t), intent(inout) :: m
call message_clear (m)
call message_append_new_block (m)
end subroutine message_init

```

Append a single byte to a message. If necessary, allocate a new block. If the message is empty, initialize it.

```

⟨MD5: procedures⟩+≡
subroutine message_append_byte (m, b)
type(message_t), intent(inout) :: m
type(byte_t), intent(in) :: b
if (.not. associated (m%last)) then
    call message_init (m)
else if (block_is_filled (m%last)) then
    call message_append_new_block (m)
end if
call block_append_byte (m%last, b)
end subroutine message_append_byte

```

Append zero bytes until the current block is filled up to the required position. If we are already beyond that, append a new block and fill that one.

```

⟨MD5: procedures⟩+≡
subroutine message_pad_zero (m, i)
type(message_t), intent(inout) :: m
integer, intent(in) :: i
type(block_t), pointer :: b
integer :: j
if (associated (m%last)) then
    b => m%last
    if (b%fill > i) then
        do j = b%fill + 1, 64 + i
            call message_append_byte (m, byte_zero)
        end do
    else
        do j = b%fill + 1, i
            call message_append_byte (m, byte_zero)
        end do
    end if
end if
end subroutine message_pad_zero

```

This returns the number of bits within a message. We need a 64-bit word for the result since it may be more than  $2^{31}$ . This is also required by the MD5 standard.

```

⟨MD5: procedures⟩+≡

```

```

function message_bits (m) result (length)
    type(message_t), intent(in) :: m
    type(word64_t) :: length
    type(block_t), pointer :: b
    integer(i64) :: n_blocks_filled, n_bytes_extra
    if (m%n_blocks > 0) then
        b => m%last
        if (block_is_filled (b)) then
            n_blocks_filled = m%n_blocks
            n_bytes_extra = 0
        else
            n_blocks_filled = m%n_blocks - 1
            n_bytes_extra = b%fill
        end if
        length = n_blocks_filled * 512 + n_bytes_extra * 8
    else
        length = 0_i64
    end if
end function message_bits

```

### 6.3.3 Message I/O

Append the contents of a string to a message. We first cast the character string into a 8-bit integer array and the append this byte by byte.

```

<MD5: procedures>+≡
subroutine message_append_string (m, s)
    type(message_t), intent(inout) :: m
    character(len=*), intent(in) :: s
    integer(i64) :: i, n_bytes
    integer(i8), dimension(:), allocatable :: buffer
    integer(i8), dimension(1) :: mold
    type(byte_t) :: b
    n_bytes = size (transfer (s, mold))
    allocate (buffer (n_bytes))
    buffer = transfer (s, mold)
    do i = 1, size (buffer)
        b = buffer(i)
        call message_append_byte (m, b)
    end do
    deallocate (buffer)
end subroutine message_append_string

```

Append the contents of a 32-bit integer to a message. We first cast the 32-bit integer into a 8-bit integer array and the append this byte by byte.

```

<MD5: procedures>+≡
subroutine message_append_i32 (m, x)
    type(message_t), intent(inout) :: m
    integer(i32), intent(in) :: x
    integer(i8), dimension(4) :: buffer
    type(byte_t) :: b
    integer :: i
    buffer = transfer (x, buffer, size(buffer))

```

```

do i = 1, size (buffer)
    b = buffer(i)
    call message_append_byte (m, b)
end do
end subroutine message_append_i32

```

Append one line from file to a message. Include the newline character.

```

<MD5: procedures>+≡
subroutine message_append_from_unit (m, u, iostat)
    type(message_t), intent(inout) :: m
    integer, intent(in) :: u
    integer, intent(out) :: iostat
    character(len=BUFFER_SIZE) :: buffer
    read (u, *, iostat=iostat) buffer
    call message_append_string (m, trim (buffer))
    call message_append_string (m, LF)
end subroutine message_append_from_unit

```

Fill a message from file. (Each line counts as a string.)

```

<MD5: procedures>+≡
subroutine message_read_from_file (m, f)
    type(message_t), intent(inout) :: m
    character(len=*), intent(in) :: f
    integer :: u, iostat
    u = free_unit ()
    open (file=f, unit=u, action='read')
    do
        call message_append_from_unit (m, u, iostat=iostat)
        if (iostat < 0) exit
    end do
    close (u)
end subroutine message_read_from_file

```

Write a message. After each block, insert an empty line.

```

<MD5: interfaces>+≡
interface message_write
    module procedure message_write_unit
end interface

<MD5: procedures>+≡
subroutine message_write_unit (m, unit, bytes, decimal)
    type(message_t), intent(in) :: m
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: bytes, decimal
    type(block_t), pointer :: b
    integer :: u
    u = given_output_unit (unit);  if (u < 0)  return
    b => m%first
    if (associated (b)) then
        do
            call block_write_unit (b, unit, bytes, decimal)
            b => b%next
            if (.not. associated (b))  exit
    end do
end subroutine message_write_unit

```

```

        write (u, *)
end do
end if
end subroutine message_write_unit

```

### 6.3.4 Auxiliary functions

These four functions on three words are defined in the MD5 standard:

```

⟨MD5: procedures⟩+≡
function ff (x, y, z)
    type(word32_t), intent(in) :: x, y, z
    type(word32_t) :: ff
    ff = ior (iand (x, y), iand (not (x), z))
end function ff

function fg (x, y, z)
    type(word32_t), intent(in) :: x, y, z
    type(word32_t) :: fg
    fg = ior (iand (x, z), iand (y, not (z)))
end function fg

function fh (x, y, z)
    type(word32_t), intent(in) :: x, y, z
    type(word32_t) :: fh
    fh = ieor (ieor (x, y), z)
end function fh

function fi (x, y, z)
    type(word32_t), intent(in) :: x, y, z
    type(word32_t) :: fi
    fi = ieor (y, ior (x, not (z)))
end function fi

```

### 6.3.5 Auxiliary stuff

This defines and initializes the table of transformation constants:

```

⟨MD5: variables⟩≡
type(word32_t), dimension(64), save :: t
logical, save :: table_initialized = .false.

⟨MD5: procedures⟩+≡
subroutine table_init
    type(word64_t) :: ww
    integer :: i
    if (.not.table_initialized) then
        do i = 1, 64
            ww = int (4294967296d0 * abs (sin (i * 1d0)), kind=i64)
            t(i) = word32_from_word64 (ww, 0)
        end do
        table_initialized = .true.
    end if

```

```
end subroutine table_init
```

This encodes the message digest (4 words) into a 32-character string.

```
(MD5: procedures)+≡
function digest_string (aa) result (s)
  type(word32_t), dimension (0:3), intent(in) :: aa
  character(len=32) :: s
  integer :: i, j
  do i = 0, 3
    do j = 0, 3
      call byte_write (byte_from_word32 (aa(i), j), s(i*8+j*2+1:i*8+j*2+2))
    end do
  end do
end function digest_string
```

### 6.3.6 MD5 algorithm

Pad the message with a byte x80 and then pad zeros up to a full block minus two words; in these words, insert the message length (before padding) as a 64-bit word, low-word first.

```
(MD5: procedures)+≡
subroutine message_pad (m)
  type(message_t), intent(inout) :: m
  type(word64_t) :: length
  integer(i8), parameter :: ipad = -128 ! z'80'
  type(byte_t) :: b
  integer :: i
  length = message_bits (m)
  b = ipad
  call message_append_byte (m, b)
  call message_pad_zero (m, 56)
  do i = 0, 7
    call message_append_byte (m, byte_from_word64 (length, i))
  end do
end subroutine message_pad
```

Apply a series of transformations onto a state **a,b,c,d**, where the transform function uses each word of the message together with the predefined words. Finally, encode the state as a 32-character string.

```
(MD5: procedures)+≡
subroutine message_digest (m, s)
  type(message_t), intent(in) :: m
  character(len=32), intent(out) :: s
  integer(i32), parameter :: ia = 1732584193 ! z'67452301'
  integer(i32), parameter :: ib = -271733879 ! z'efcdab89'
  integer(i32), parameter :: ic = -1732584194 ! z'98badcfe'
  integer(i32), parameter :: id = 271733878 ! z'10325476'
  type(word32_t) :: a, b, c, d
  type(word32_t) :: aa, bb, cc, dd
  type(word32_t), dimension(0:15) :: x
  type(block_t), pointer :: bl
```

```

call table_init
a = ia;  b = ib;  c = ic;  d = id
bl => m%first
do
  if (.not.associated (bl)) exit
  x = bl%w
  aa = a;  bb = b;  cc = c;  dd = d
  call transform (ff, a, b, c, d, 0, 7, 1)
  call transform (ff, d, a, b, c, 1, 12, 2)

contains
⟨MD5: Internal subroutine transform⟩
end subroutine message_digest

```

And this is the actual transformation that depends on one of the previous functions, four words, and three integers. The implicit arguments are *x*, the word from the message to digest, and *t*, the entry in the predefined table.

```

⟨MD5: Internal subroutine transform⟩≡
subroutine transform (f, a, b, c, d, k, s, i)
interface
  function f (x, y, z)
    import word32_t
    type(word32_t), intent(in) :: x, y, z
    type(word32_t) :: f
  end function f
end interface
type(word32_t), intent(inout) :: a
type(word32_t), intent(in) :: b, c, d
integer, intent(in) :: k, s, i
a = b + ishftc (a + f(b, c, d) + x(k) + t(i), s)
end subroutine transform

```

### 6.3.7 User interface

```

⟨MD5: public⟩≡
public :: md5sum
⟨MD5: interfaces⟩+≡
interface md5sum

```

```

    module procedure md5sum_from_string
    module procedure md5sum_from_unit
end interface

```

This function computes the MD5 sum of the input string and returns it as a 32-character string

```

<MD5: procedures>+≡
function md5sum_from_string (s) result (digest)
    character(len=*) , intent(in) :: s
    character(len=32) :: digest
    type(message_t) :: m
    call message_append_string (m, s)
    call message_pad (m)
    call message_digest (m, digest)
    call message_clear (m)
end function md5sum_from_string

```

This funct. reads from unit u (an unformmated sequence of integers) and computes the MD5 sum.

```

<MD5: procedures>+≡
function md5sum_from_unit (u) result (digest)
    integer, intent(in) :: u
    character(len=32) :: digest
    type(message_t) :: m
    character :: char
    integer :: iostat
    READ_CHARS: do
        read (u, "(A)", advance="no", iostat=iostat) char
        select case (iostat)

            call message_append_string (m, char)
        case (EOR)
            call message_append_string (m, LF)
        case (EOF)
            exit READ_CHARS
        case default
            call msg_fatal &
                ("Computing MD5 sum: I/O error while reading from scratch file")
        end select
    end do READ_CHARS
    call message_pad (m)
    call message_digest (m, digest)
    call message_clear (m)
end function md5sum_from_unit

```

### 6.3.8 Unit tests

Test module, followed by the corresponding implementation module.

```

<md5_ut.f90>≡
<File header>

```

```
module md5_ut
```

```

use unit_tests
use md5_uti

⟨Standard module head⟩

⟨MD5: public test⟩

contains

⟨MD5: test driver⟩

end module md5_ut

⟨md5_uti.f90⟩≡
⟨File header⟩

module md5_uti

use diagnostics

use md5

⟨Standard module head⟩

⟨MD5: test declarations⟩

contains

⟨MD5: tests⟩

end module md5_uti

```

API: driver for the unit tests below.

```

⟨MD5: public test⟩≡
    public :: md5_test

⟨MD5: test driver⟩≡
    subroutine md5_test (u, results)
        integer, intent(in) :: u
        type(test_results_t), intent(inout) :: results
    ⟨MD5: execute tests⟩
    end subroutine md5_test

```

This function checks the implementation by computing the checksum of certain strings and comparing them with the known values.

```

⟨MD5: execute tests⟩≡
    call test (md5_1, "md5_1", &
               "check MD5 sums", &
               u, results)

⟨MD5: test declarations⟩≡
    public :: md5_1

⟨MD5: tests⟩≡
    subroutine md5_1 (u)
        integer, intent(in) :: u

```

## 6.4 Permutations

Permute arrays of integers (of specific kind).

`<permutations.f90>`≡  
`<File header>`

## module permutations

use kinds, only: TC

*⟨Standard module head⟩*

```

⟨Permutations: public⟩

⟨Permutations: types⟩

⟨Permutations: interfaces⟩

contains

⟨Permutations: procedures⟩

end module permutations

```

#### 6.4.1 Permutations

A permutation is an array of integers. Each integer between one and `size` should occur exactly once.

```

⟨Permutations: public⟩≡
    public :: permutation_t

⟨Permutations: types⟩≡
    type :: permutation_t
        private
        integer, dimension(:), allocatable :: p
    end type permutation_t

```

Initialize with the identity permutation.

```

⟨Permutations: public⟩+≡
    public :: permutation_init
    public :: permutation_final

⟨Permutations: procedures⟩≡
    elemental subroutine permutation_init (p, size)
        type(permutation_t), intent(inout) :: p
        integer, intent(in) :: size
        integer :: i
        allocate (p%p (size))
        forall (i = 1:size)
            p%p(i) = i
        end forall
    end subroutine permutation_init

    elemental subroutine permutation_final (p)
        type(permutation_t), intent(inout) :: p
        deallocate (p%p)
    end subroutine permutation_final

```

I/O:

```

⟨Permutations: public⟩+≡
    public :: permutation_write

⟨Permutations: procedures⟩+≡
    subroutine permutation_write (p, u)
        type(permutation_t), intent (in) :: p

```

```

integer, intent(in) :: u
integer :: i
do i = 1, size (p%p)
    if (size (p%p) < 10) then
        write (u,"(1x,I1)", advance="no") p%p(i)
    else
        write (u,"(1x,I3)", advance="no") p%p(i)
    end if
end do
write (u, *)
end subroutine permutation_write

```

Administration:

```

⟨Permutations: public⟩+≡
    public :: permutation_size

⟨Permutations: procedures⟩+≡
    elemental function permutation_size (perm) result (s)
        type(permutation_t), intent(in) :: perm
        integer :: s
        s = size (perm%p)
    end function permutation_size

```

Extract an entry in a permutation.

                perm%p(i) = j
                exit
            end if
            perm%p(i) = 0
        end do
    end do
end subroutine permutation_find

```

Find all permutations that transform an array of integers into itself. The resulting permutation list is allocated with the correct length and filled.

The first step is to count the number of different entries in `code`. Next, we scan `code` again and assign a mask to each different entry, true for all identical entries. Finally, we recursively permute the identity for each possible mask.

The permutation is done as follows: A list of all permutations of the initial one with respect to the current mask is generated, then the permutations are generated in turn for each permutation in this list with the next mask. The result is always stored back into the main list, starting from the end of the current list.

```

⟨Permutations: public⟩+≡
public :: permutation_array_make

⟨Permutations: procedures⟩+≡
subroutine permutation_array_make (pa, code)
    type(permutation_t), dimension(:), allocatable, intent(out) :: pa
    integer, dimension(:), intent(in) :: code
    logical, dimension(size(code)) :: mask
    logical, dimension(:, :), allocatable :: imask
    integer, dimension(:), allocatable :: n_i
    type(permutation_t) :: p_init

```

```

type(permutation_t), dimension(:), allocatable :: p_tmp
integer :: psize, i, j, k, n_different, n, nn_k
psize = size (code)
mask = .true.
n_different = 0
do i=1, psize
    if (mask(i)) then
        n_different = n_different + 1
        mask = mask .and. (code /= code(i))
    end if
end do
allocate (imask(psize, n_different), n_i(n_different))
mask = .true.
k = 0
do i=1, psize
    if (mask(i)) then
        k = k + 1
        imask(:,k) = (code == code(i))
        n_i(k) = factorial (count(imask(:,k)))
        mask = mask .and. (code /= code(i))
    end if
end do
n = product (n_i)
allocate (pa (n))
call permutation_init (p_init, psize)
pa(1) = p_init
nn_k = 1
do k = 1, n_different
    allocate (p_tmp (n_i(k)))
    do i = nn_k, 1, -1
        call permutation_array_with_mask (p_tmp, imask(:,k), pa(i))
        do j = n_i(k), 1, -1
            pa((i-1)*n_i(k) + j) = p_tmp(j)
        end do
    end do
    deallocate (p_tmp)
    nn_k = nn_k * n_i(k)
end do
call permutation_final (p_init)
deallocate (imask, n_i)
end subroutine permutation_array_make

```

Make a list of permutations of the elements marked true in the `mask` array. The final permutation list must be allocated with the correct length ( $n!$ ). The third argument is the initial permutation to start with, which must have the same length as the `mask` array (this is not checked).

*(Permutations: procedures)*+≡

```

subroutine permutation_array_with_mask (pa, mask, p_init)
    type(permutation_t), dimension(:), intent(inout) :: pa
    logical, dimension(:), intent(in) :: mask
    type(permutation_t), intent(in) :: p_init
    integer :: plen
    integer :: i, ii, j, fac_i, k, x

```

```

integer, dimension(:), allocatable :: index
plen = size (pa)
allocate (index(count(mask)))
ii = 0
do i = 1, size (mask)
    if (mask(i)) then
        ii = ii + 1
        index(ii) = i
    end if
end do
pa = p_init
ii = 0
fac_i = 1
do i = 1, size (mask)
    if (mask(i)) then
        ii = ii + 1
        fac_i = fac_i * ii
        x = permute (i, p_init)
        do j = 1, plen
            k = ii - mod (((j-1)*fac_i)/plen, ii)
            call insert (pa(j), x, k, ii, index)
        end do
    end if
end do
deallocate (index)
contains
    subroutine insert (p, x, k, n, index)
        type(permuation_t), intent(inout) :: p
        integer, intent(in) :: x, k, n
        integer, dimension(:), intent(in) :: index
        integer :: i
        do i = n, k+1, -1
            p%p(index(i)) = p%p(index(i-1))
        end do
        p%p(index(k)) = x
    end subroutine insert
end subroutine permutation_array_with_mask

```

The factorial function is needed for pre-determining the number of permutations that will be generated:

```

⟨Permutations: procedures⟩+≡
function factorial (n) result (f)
    integer, intent(in) :: n
    integer :: f
    integer :: i
    f = 1
    do i=2, abs(n)
        f = f*i
    end do
end function factorial

```

### 6.4.2 Operations on binary codes

Binary codes are needed for phase-space trees. Since the permutation function uses permutations, and no other special type is involved, we put the functions here.

This is needed for phase space trees: permute bits in a tree binary code. If no permutation is given, leave as is. (We may want to access the permutation directly here if this is efficiency-critical.)

```
(Permutations: public)+≡
  public :: tc_permute

(Permutations: procedures)+≡
  function tc_permute (k, perm, mask_in) result (pk)
    integer(TC), intent(in) :: k, mask_in
    type(perm_t), intent(in) :: perm
    integer(TC) :: pk
    integer :: i
    pk = iand (k, mask_in)
    do i = 1, size (perm%p)
      if (btest(k,i-1)) pk = ibset (pk, perm%p(i)-1)
    end do
  end function tc_permute
```

This routine returns the number of set bits in the tree code value `k`. Hence, it is the number of externals connected to the current line. If `mask` is present, the complement of the tree code is also considered, and the smaller number is returned. This gives the true distance from the external states, taking into account the initial particles. The complement number is increased by one, since for a scattering diagram the vertex with the sum of all final-state codes is still one point apart from the initial particles.

```
(Permutations: public)+≡
  public :: tc_decay_level

(Permutations: interfaces)≡
  interface tc_decay_level
    module procedure decay_level_simple
    module procedure decay_level_complement
  end interface

(Permutations: procedures)+≡
  function decay_level_complement (k, mask) result (l)
    integer(TC), intent(in) :: k, mask
    integer :: l
    l = min (decay_level_simple (k), &
              decay_level_simple (ieor (k, mask)) + 1)
  end function decay_level_complement

  function decay_level_simple (k) result(l)
    integer(TC), intent(in) :: k
    integer :: l
    integer :: i
    l = 0
    do i=0, bit_size(k)-1
      if (btest(k,i)) l = l+1
    end do
  end function decay_level_simple
```

```

    end do
end function decay_level_simple
```

## 6.5 Sorting

This small module provides functions for sorting integer or real arrays.

```

⟨sorting.f90⟩≡
  ⟨File header⟩

module sorting

⟨Use kinds⟩
  use diagnostics

⟨Standard module head⟩

⟨Sorting: public⟩

⟨Sorting: interfaces⟩

contains

⟨Sorting: procedures⟩

end module sorting
```

### 6.5.1 Implementation

The `sort` function returns, for a given integer or real array, the array sorted by increasing value. The current implementation is *mergesort*, which has  $O(n \ln n)$  behavior in all cases, and is stable for elements of equal value.

The `sort_abs` variant sorts by increasing absolute value, where for identical absolute value, the positive number comes first.

```

⟨Sorting: public⟩≡
  public :: sort
  public :: sort_abs

⟨Sorting: interfaces⟩≡
  interface sort
    module procedure sort_int
    module procedure sort_real
  end interface

  interface sort_abs
    module procedure sort_int_abs
  end interface
```

This variant of integer sort returns The body is identical, just the interface differs.

```
⟨Sorting: procedures⟩≡
```

```

function sort_int (val_in) result (val)
    integer, dimension(:), intent(in) :: val_in
    integer, dimension(size(val_in)) :: val
    ⟨Sorting: sort⟩
end function sort_int

function sort_real (val_in) result (val)
    real(default), dimension(:), intent(in) :: val_in
    real(default), dimension(size(val_in)) :: val
    ⟨Sorting: sort⟩
end function sort_real

function sort_int_abs (val_in) result (val)
    integer, dimension(:), intent(in) :: val_in
    integer, dimension(size(val_in)) :: val
    ⟨Sorting: sort abs⟩
end function sort_int_abs

⟨Sorting: sort⟩≡
    val = val_in( order (val_in) )

⟨Sorting: sort abs⟩≡
    val = val_in( order_abs (val_in) )

The order function returns, for a given integer or real array, the array of indices
of the elements sorted by increasing value.

⟨Sorting: public⟩+≡
    public :: order
    public :: order_abs

⟨Sorting: interfaces⟩+≡
    interface order
        module procedure order_int
        module procedure order_real
    end interface

    interface order_abs
        module procedure order_int_abs
    end interface

⟨Sorting: procedures⟩+≡
    function order_int (val) result (idx)
        integer, dimension(:), intent(in) :: val
        integer, dimension(size(val)) :: idx
    ⟨Sorting: order⟩
end function order_int

    function order_real (val) result (idx)
        real(default), dimension(:), intent(in) :: val
        integer, dimension(size(val)) :: idx
    ⟨Sorting: order⟩
end function order_real

    function order_int_abs (val) result (idx)
        integer, dimension(:), intent(in) :: val

```

```

    integer, dimension(size(val)) :: idx
(Sorting: order abs)
end function order_int_abs

```

We start by individual elements, merge them to pairs, merge those to four-element subarrays, and so on. The last subarray can extend only up to the original array bound, of course, and the second of the subarrays to merge should contain at least one element.

```

(Sorting: order)≡
(Sorting: order1)
    call merge (idx(b1:e2), idx(b1:e1), idx(b2:e2), val)
(Sorting: order2)
(Sorting: order abs)≡
(Sorting: order1)
    call merge_abs (idx(b1:e2), idx(b1:e1), idx(b2:e2), val)
(Sorting: order2)
(Sorting: order1)≡
    integer :: n, i, s, b1, b2, e1, e2
    n = size (idx)
    forall (i = 1:n)
        idx(i) = i
    end forall
    s = 1
    do while (s < n)
        do b1 = 1, n-s, 2*s
            b2 = b1 + s
            e1 = b2 - 1
            e2 = min (e1 + s, n)

(Sorting: order2)≡
        end do
        s = 2 * s
    end do

```

The merging step does the actual sorting. We take two sorted array sections and merge them to a sorted result array. We are working on the indices, and comparing is done by taking the associated *val* which is real or integer.

```

(Sorting: interfaces)+≡
interface merge
    module procedure merge_int
    module procedure merge_real
end interface

interface merge_abs
    module procedure merge_int_abs
end interface

(Sorting: procedures)+≡
subroutine merge_int (res, src1, src2, val)
    integer, dimension(:), intent(out) :: res
    integer, dimension(:), intent(in) :: src1, src2
    integer, dimension(:), intent(in) :: val

```

```

    integer, dimension(size(res)) :: tmp
(Sorting: merge)
end subroutine merge_int

subroutine merge_real (res, src1, src2, val)
    integer, dimension(:, ), intent(out) :: res
    integer, dimension(:, ), intent(in) :: src1, src2
    real(default), dimension(:, ), intent(in) :: val
    integer, dimension(size(res)) :: tmp
(Sorting: merge)
end subroutine merge_real

subroutine merge_int_abs (res, src1, src2, val)
    integer, dimension(:, ), intent(out) :: res
    integer, dimension(:, ), intent(in) :: src1, src2
    integer, dimension(:, ), intent(in) :: val
    integer, dimension(size(res)) :: tmp
(Sorting: merge abs)
end subroutine merge_int_abs

```

```

(Sorting: merge)≡
(Sorting: merge1)
    if (val(src1(i1)) <= val(src2(i2))) then
(Sorting: merge2)

```

We keep the elements if the absolute values are strictly ordered. If they are equal in magnitude, we keep them if the larger value comes first, or if they are equal.

```

(Sorting: merge abs)≡
(Sorting: merge1)
    if (abs (val(src1(i1))) < abs (val(src2(i2))) .or. &
        (abs (val(src1(i1))) == abs (val(src2(i2))) .and. &
        val(src1(i1)) >= val(src2(i2)))) then
(Sorting: merge2)

(Sorting: merge1)≡
    integer :: i1, i2, i
    i1 = 1
    i2 = 1
    do i = 1, size (tmp)

(Sorting: merge2)≡
    tmp(i) = src1(i1);  i1 = i1 + 1
    if (i1 > size (src1)) then
        tmp(i+1:) = src2(i2:)
        exit
    end if
    else
        tmp(i) = src2(i2);  i2 = i2 + 1
        if (i2 > size (src2)) then
            tmp(i+1:) = src1(i1:)
            exit
        end if
    end if
end do

```

```
res = tmp
```

### 6.5.2 Concatenating arrays

Not precisely a sorting function, but useful: Concatenate two arrays.

```
<Sorting: public>+≡
    public :: concat

<Sorting: interfaces>+≡
    interface concat
        module procedure concat_int
        module procedure concat_real
    end interface

<Sorting: procedures>+≡
    function concat_int (val1, val2) result (val12)
        integer, dimension(:, intent(in) :: val1, val2
        integer, dimension(size(val1)+size(val2)) :: val12
    <Sorting: concat>
    end function concat_int

    function concat_real (val1, val2) result (val12)
        real(default), dimension(:, intent(in) :: val1, val2
        integer, dimension(size(val1)+size(val2)) :: val12
    <Sorting: concat>
    end function concat_real

<Sorting: concat>≡
    val12(:size(val1)) = val1
    val12(size(val1)+1:) = val2
```

### 6.5.3 Unit tests

Test module, followed by the corresponding implementation module.

```
<sorting_ut.f90>≡
    <File header>

    module sorting_ut
        use unit_tests
        use sorting_ut
    contains
        <Sorting: public test>
        <Sorting: test driver>
    end module sorting_ut
```

```

⟨sorting_uti.f90⟩≡
  ⟨File header⟩

  module sorting_uti

  ⟨Use kinds⟩

    use sorting

  ⟨Standard module head⟩

  ⟨Sorting: test declarations⟩

  contains

  ⟨Sorting: tests⟩

  end module sorting_uti

```

API: driver for the unit tests below.

```

⟨Sorting: public test⟩≡
  public :: sorting_test

⟨Sorting: test driver⟩≡
  subroutine sorting_test (u, results)
    integer, intent(in) :: u
    type(test_results_t), intent(inout) :: results
  ⟨Sorting: execute tests⟩
  end subroutine sorting_test

```

This checks whether the sorting routine works correctly.

```

⟨Sorting: execute tests⟩≡
  call test (sorting_1, "sorting_1", &
             "check sorting routines", &
             u, results)

⟨Sorting: test declarations⟩≡

## 6.6 Grids

*This is not really a combinatorics module but this directory is the closest I could find. Maybe this will be moved to a separate directory or combined with related stuff.*

```

<grids.f90>≡
  <File header>

module grids

  <Use kinds>
  use constants, only: zero, one, tiny_07
  use io_units
  use format_defs, only: FMT_16
  use diagnostics
```

```
<Standard module head>
```

```
<grids: public>
```

```
<grids: interfaces>
```

```
<grids: parameters>
```

```
<grids: types>
```

```
contains
```

```
<grids: procedures>
```

```
end module grids
```

Grids are used in many applications and a general implementation seems useful. The relevant properties implemented so far are

- Segments of the hypercube are represented by an integer array with size  $d$  corresponding to the dimension.
- There is a mapping from the indices to the location in the continuous memory block of values.
- Given a point in the hypercube, find the corresponding segment and the value of the grid therein.
- Update the grid sequentially to represent the maximum of a function over the unit hypercube.
- The grid can be saved to and recovered from disk.

The following might be implemented in the future

- Generate a random point in the hypercube by interpreting the grid as probability distribution.

*This would most likely be solved by using projections and the selector\_t, which would make a move of this module higher up in the dependency tree necessary.*

- Update the grid sequentially to represent the *minimum* of a function over the unit hypercube.

```
<grids: public>≡  
    public :: grid_t  
<grids: types>≡  
    type :: grid_t  
        private  
            real(default), dimension(:), allocatable :: values  
            integer, dimension(:), allocatable :: points  
    contains  
        <grids: grid: TBP>  
    end type grid_t
```

### 6.6.1 Initializer and finalizer

For initialization, we expect the number of points for each dimension as an array or the the number of dimensions as a scalar whereby the default number of points is used then for each dimension.

```
(grids: grid: TBP)≡
    generic :: init => init_base, init_simple
    procedure :: init_base => grid_init_base
    procedure :: init_simple => grid_init_simple

(grids: procedures)≡
    pure subroutine grid_init_base (grid, points)
        class(grid_t), intent(inout) :: grid
        integer, dimension(:), intent(in) :: points
        allocate (grid%points (size (points)))
        allocate (grid%values (product (points)))
        grid%points = points
        grid%values = zero
    end subroutine grid_init_base

(grids: procedures)+≡
    pure subroutine grid_init_simple (grid, dimensions)
        class(grid_t), intent(inout) :: grid
        integer, intent(in) :: dimensions
        allocate (grid%points (dimensions))
        allocate (grid%values (DEFAULT_POINTS_PER_DIMENSION ** dimensions))
        grid%points = DEFAULT_POINTS_PER_DIMENSION
        grid%values = zero
    end subroutine grid_init_simple
```

Manual assignment (tests)

```
(grids: grid: TBP)+≡
    procedure :: set_values => grid_set_values

(grids: procedures)+≡
    subroutine grid_set_values (grid, values)
        class(grid_t), intent(inout) :: grid
        real(default), dimension(:), intent(in) :: values
        grid%values = values
    end subroutine grid_set_values
```

A reasonable default

```
(grids: parameters)≡
    integer, parameter :: DEFAULT_POINTS_PER_DIMENSION = 100
```

Calling this is not mandatory, when an instance of `grid_t` goes out of scope as it will be done by Fortran automatically.

```
(grids: grid: TBP)+≡
    procedure :: final => grid_final

(grids: procedures)+≡
    pure subroutine grid_final (grid)
        class(grid_t), intent(inout) :: grid
        if (allocated (grid%values)) then
```

```

    deallocate (grid%values)
end if
if (allocated (grid%points)) then
    deallocate (grid%points)
end if
end subroutine grid_final

```

### 6.6.2 Segment finding and memory mapping

The `indices` array is expected to go from 1 to  $d$  whereby the entries for the different dims are from 1 to  $n_{\text{points}}(\text{dim})$ .

We get the value of the grid either from given `indices` or from a point  $x$  in the hypercube. In the latter case, we have to find the segment first.

```

<grids: grid: TBP>+≡
    generic :: get_value => get_value_from_x, get_value_from_indices
    procedure :: get_value_from_x => grid_get_value_from_x
    procedure :: get_value_from_indices => grid_get_value_from_indices

<grids: procedures>+≡
    function grid_get_value_from_indices (grid, indices)
        real(default) :: grid_get_value_from_indices
        class(grid_t), intent(in) :: grid
        integer, dimension(:), intent(in) :: indices
        grid_get_value_from_indices = grid%values(grid%get_index(indices))
    end function grid_get_value_from_indices

<grids: procedures>+≡
    function grid_get_value_from_x (grid, x)
        real(default) :: grid_get_value_from_x
        class(grid_t), intent(in) :: grid
        real(default), dimension(:), intent(in) :: x
        grid_get_value_from_x = grid_get_value_from_indices &
            (grid, grid_get_segment (grid, x))
    end function grid_get_value_from_x

```

The segment is the part of the grid that contains the point  $x$  and is identified by a tupel of `indices`. This is just a brute force search, for fine grids one could also implement a binary search for  $\mathcal{O}(\log N)$  behavior instead of  $\mathcal{O}(N)$ .

```

<grids: grid: TBP>+≡
    procedure :: get_segment => grid_get_segment

<grids: procedures>+≡
    function grid_get_segment (grid, x, unit)
        class(grid_t), intent(in) :: grid
        real(default), dimension(:), intent(in) :: x
        integer, intent(in), optional :: unit
        integer, dimension(1:size (x)) :: grid_get_segment
        integer :: dim, i
        real(default) :: segment_width
        grid_get_segment = 0
        do dim = 1, size (grid%points)
            segment_width = one / grid%points (dim)

```

```

SEARCH: do i = 1, grid%points (dim)
    if (x (dim) <= i * segment_width + tiny_07) then
        grid_get_segment (dim) = i
        exit SEARCH
    end if
end do SEARCH
if (grid_get_segment (dim) == 0) then
    do i = 1, size(x)
        write (msg_buffer, "(A," // DEFAULT_OUTPUT_PRECISION // ")") &
            "x[i] = ", x(i)
        call msg_message ()
    end do
    call msg_error ("grid_get_segment: Did not find x in [0,1]^d", &
        unit=unit)
end if
end do
end function grid_get_segment

```

This is a simple storage mapping function but more sophisticated ideas like hashing could be implemented.

$$\begin{aligned} \text{index} = & \text{indices}(1) + \\ & \text{indices}(2) * \text{size}(1) + \\ & \text{indices}(3) * \text{size}(1) * \text{size}(2) + \dots \end{aligned} \quad (6.1)$$

```

<grids: grid: TBP>+≡
procedure :: get_index => grid_get_index
<grids: procedures>+≡
pure function grid_get_index (grid, indices) result (grid_index)
    integer :: grid_index
    class(grid_t), intent(in) :: grid
    integer, dimension(:), intent(in) :: indices
    integer :: dim_innerloop, dim_outerloop, multiplier
    grid_index = 1
    do dim_outerloop = 1, size(indices)
        multiplier = 1
        do dim_innerloop = 1, dim_outerloop - 1
            multiplier = multiplier * grid%points (dim_innerloop)
        end do
        grid_index = grid_index + (indices(dim_outerloop) - 1) * multiplier
    end do
end function grid_get_index

```

### 6.6.3 Grid manipulations

Given a point in the hypercube  $x$  and its value  $y$ , we update the grids, such that the stepwise function  $f$  defined by the grid is  $f(x_i) \geq y_i \forall \{x_i, y_i\}$ .

```

<grids: grid: TBP>+≡
procedure :: update_maxima => grid_update_maxima

```

```

⟨grids: procedures⟩+≡
    subroutine grid_update_maxima (grid, x, y)
        class(grid_t), intent(inout) :: grid
        real(default), dimension(:), intent(in) :: x
        real(default), intent(in) :: y
        integer, dimension(1:size(x)) :: indices
        indices = grid%get_segment (x)
        if (grid%get_value (indices) < y) then
            grid%values (grid%get_index (indices)) = y
        end if
    end subroutine grid_update_maxima

More general cases have to be thought through when they are needed. This is inefficient and non-general.

⟨grids: grid: TBP⟩+≡
    procedure :: get_maximum_in_3d => grid_get_maximum_in_3d

⟨grids: procedures⟩+≡
    function grid_get_maximum_in_3d (grid, projected_index) result (maximum)
        real(default) :: maximum
        class(grid_t), intent(in) :: grid
        integer, intent(in) :: projected_index
        real(default) :: val
        integer :: i, j
        maximum = zero
        do i = 1, grid%points(1)
            do j = 1, grid%points(2)
                val = grid%get_value ([i, j, projected_index])
                if (val > maximum) then
                    maximum = val
                end if
            end do
        end do
        end function grid_get_maximum_in_3d

⟨grids: grid: TBP⟩+≡
    procedure :: is_non_zero_everywhere => grid_is_non_zero_everywhere

⟨grids: procedures⟩+≡
    pure function grid_is_non_zero_everywhere (grid) result (yorn)
        logical :: yorn
        class(grid_t), intent(in) :: grid
        yorn = all (abs (grid%values) > zero)
    end function grid_is_non_zero_everywhere

```

#### 6.6.4 Input and Output to screen and disk

```

⟨grids: grid: TBP⟩+≡

# Chapter 7

## Text handling

WHIZARD has to handle complex structures in input (and output) data. Doing this in a generic and transparent way requires a generic lexer and parser. The necessary modules are implemented here:

**ifiles** Implementation of line-oriented internal files in a more flexible way (linked lists of variable-length strings) than the Fortran builtin features.

**lexers** Read text and transform it into a token stream.

**syntax\_rules** Define the rules for interpreting tokens, to be used by the WHIZARD parser.

**parser** Categorize tokens (keyword, string, number etc.) and use a set of syntax rules to transform the input into a parse tree.

**xml** Read and parse XML text, separate from the WHIZARD parser.

## 7.1 Internal files

The internal files introduced here (`ifile`) are a replacement for the built-in internal files, which are fixed-size arrays of fixed-length character strings. The `ifile` type is a doubly-linked list of variable-length character strings with line numbers.

```
<ifiles.f90>≡
<File header>

module ifiles

<Use strings>
use io_units
use system_defs, only: EOF

<Standard module head>

<Ifiles: public>

<Ifiles: types>

<Ifiles: interfaces>

contains

<Ifiles: subroutines>

end module ifiles
```

### 7.1.1 The line type

The line entry type is for internal use, it is the list entry to be collected in an `ifile` object.

```
<Ifiles: types>≡
type :: line_entry_t
private
type(line_entry_t), pointer :: previous => null ()
type(line_entry_t), pointer :: next => null ()
type(string_t) :: string
integer :: index
end type line_entry_t
```

Create a new list entry, given a varying string as input. The line number and pointers are not set, these make sense only within an `ifile`.

```
<Ifiles: subroutines>≡
subroutine line_entry_create (line, string)
type(line_entry_t), pointer :: line
type(string_t), intent(in) :: string
allocate (line)
line%string = string
end subroutine line_entry_create
```

Destroy a single list entry: Since the pointer components should not be deallocated explicitly, just deallocate the object itself.

```
(Ifiles: subroutines)+≡
    subroutine line_entry_destroy (line)
        type(line_entry_t), pointer :: line
        deallocate (line)
    end subroutine line_entry_destroy
```

### 7.1.2 The ifile type

The internal file is a linked list of line entries.

```
(Ifiles: public)≡
    public :: ifile_t
(Ifiles: types)+≡
    type :: ifile_t
        private
        type(line_entry_t), pointer :: first => null ()
        type(line_entry_t), pointer :: last => null ()
        integer :: n_lines = 0
        contains
            (Ifiles: ifile: TBP)
    end type ifile_t
```

We need no explicit initializer, but a routine which recursively deallocates the contents may be appropriate. After this, existing line pointers may become undefined, so they should be nullified before the file is destroyed.

```
(Ifiles: public)+≡
    public :: ifile_clear
(Ifiles: subroutines)+≡
    subroutine ifile_clear (ifile)
        class(ifile_t), intent(inout) :: ifile
        type(line_entry_t), pointer :: current
        do while (associated (ifile%first))
            current => ifile%first
            ifile%first => current%next
            call line_entry_destroy (current)
        end do
        nullify (ifile%last)
        ifile%n_lines = 0
    end subroutine ifile_clear
```

The finalizer is just an alias for the above.

```
(Ifiles: public)+≡
    public :: ifile_final
(Ifiles: ifile: TBP)≡
    procedure :: final => ifile_clear
(Ifiles: interfaces)≡
    interface ifile_final
        module procedure ifile_clear
    end interface
```

### 7.1.3 I/O on ifiles

Fill an ifile from an ordinary external file, i.e., I/O unit. If the ifile is not empty, the old contents will be destroyed. We can read a fixed-length character string, an ISO varying string, an ordinary internal file (character-string array), or from an external unit. In the latter case, lines are appended until EOF is reached. Finally, there is a variant which reads from another ifile, effectively copying it.

```

⟨Ifiles: public⟩+≡
    public :: ifile_read

⟨Ifiles: interfaces⟩+≡
    interface ifile_read
        module procedure ifile_read_from_string
        module procedure ifile_read_from_char
        module procedure ifile_read_from_unit
        module procedure ifile_read_from_char_array
        module procedure ifile_read_from_ifile
    end interface

⟨Ifiles: subroutines⟩+≡
    subroutine ifile_read_from_string (ifile, string)
        type(ifile_t), intent(inout) :: ifile
        type(string_t), intent(in) :: string
        call ifile_clear (ifile)
        call ifile_append (ifile, string)
    end subroutine ifile_read_from_string

    subroutine ifile_read_from_char (ifile, char)
        type(ifile_t), intent(inout) :: ifile
        character(*), intent(in) :: char
        call ifile_clear (ifile)
        call ifile_append (ifile, char)
    end subroutine ifile_read_from_char

    subroutine ifile_read_from_char_array (ifile, char)
        type(ifile_t), intent(inout) :: ifile
        character(*), dimension(:), intent(in) :: char
        call ifile_clear (ifile)
        call ifile_append (ifile, char)
    end subroutine ifile_read_from_char_array

    subroutine ifile_read_from_unit (ifile, unit, iostat)
        type(ifile_t), intent(inout) :: ifile
        integer, intent(in) :: unit
        integer, intent(out), optional :: iostat
        call ifile_clear (ifile)
        call ifile_append (ifile, unit, iostat)
    end subroutine ifile_read_from_unit

    subroutine ifile_read_from_ifile (ifile, ifile_in)
        type(ifile_t), intent(inout) :: ifile
        type(ifile_t), intent(in) :: ifile_in
        call ifile_clear (ifile)
        call ifile_append (ifile, ifile_in)
    end subroutine ifile_read_from_ifile

```

Append to an ifile. The same as reading, but without resetting the ifile. In addition, there is a routine for appending a whole ifile.

```

⟨Ifiles: public⟩+≡
    public :: ifile_append
⟨Ifiles: ifile: TBP⟩+≡
    generic :: append => &
        ifile_append_from_char
    procedure, private :: ifile_append_from_char
⟨Ifiles: interfaces⟩+≡
    interface ifile_append
        module procedure ifile_append_from_string
        module procedure ifile_append_from_char
        module procedure ifile_append_from_unit
        module procedure ifile_append_from_char_array
        module procedure ifile_append_from_ifile
    end interface
⟨Ifiles: subroutines⟩+≡
    subroutine ifile_append_from_string (ifile, string)
        class(ifile_t), intent(inout) :: ifile
        type(string_t), intent(in) :: string
        type(line_entry_t), pointer :: current
        call line_entry_create (current, string)
        current%index = ifile%n_lines + 1
        if (associated (ifile%last)) then
            current%previous => ifile%last
            ifile%last%next => current
        else
            ifile%first => current
        end if
        ifile%last => current
        ifile%n_lines = current%index
    end subroutine ifile_append_from_string

    subroutine ifile_append_from_char (ifile, char)
        class(ifile_t), intent(inout) :: ifile
        character(*), intent(in) :: char
        call ifile_append_from_string (ifile, var_str (trim (char)))
    end subroutine ifile_append_from_char

    subroutine ifile_append_from_char_array (ifile, char)
        class(ifile_t), intent(inout) :: ifile
        character(*), dimension(:), intent(in) :: char
        integer :: i
        do i = 1, size (char)
            call ifile_append_from_string (ifile, var_str (trim (char(i))))
        end do
    end subroutine ifile_append_from_char_array

    subroutine ifile_append_from_unit (ifile, unit, iostat)
        class(ifile_t), intent(inout) :: ifile
        integer, intent(in) :: unit

```

```

integer, intent(out), optional :: iostat
type(string_t) :: buffer
integer :: ios
ios = 0
READ_LOOP: do
    call get (unit, buffer, iostat = ios)
    if (ios == EOF .or. ios > 0)  exit READ_LOOP
    call ifile_append_from_string (ifile, buffer)
end do READ_LOOP
if (present (iostat)) then
    iostat = ios
else if (ios > 0) then
    call get (unit, buffer) ! trigger error again
end if
end subroutine ifile_append_from_unit

subroutine ifile_append_from_ifile (ifile, ifile_in)
    class(ifile_t), intent(inout) :: ifile
    type(ifile_t), intent(in) :: ifile_in
    type(line_entry_t), pointer :: current
    current => ifile_in%first
    do while (associated (current))
        call ifile_append_from_string (ifile, current%string)
        current => current%next
    end do
end subroutine ifile_append_from_ifile

```

Write the ifile contents to an external unit

```

<Ifiles: public>+≡
public :: ifile_write
<Ifiles: subroutines>+≡
    subroutine ifile_write (ifile, unit, iostat)
        type(ifile_t), intent(in) :: ifile
        integer, intent(in), optional :: unit
        integer, intent(out), optional :: iostat
        integer :: u
        type(line_entry_t), pointer :: current
        u = given_output_unit (unit);  if (u < 0)  return
        current => ifile%first
        do while (associated (current))
            call put_line (u, current%string, iostat)
            current => current%next
        end do
    end subroutine ifile_write

```

Convert the ifile to an array of strings, which is allocated by this function:

```

<Ifiles: public>+≡
public :: ifile_to_string_array
<Ifiles: subroutines>+≡
    subroutine ifile_to_string_array (ifile, string)
        type(ifile_t), intent(in) :: ifile
        type(string_t), dimension(:), intent(inout), allocatable :: string

```

```

type(line_entry_t), pointer :: current
integer :: i
allocate (string (ifile_get_length (ifile)))
current => ifile%first
do i = 1, ifile_get_length (ifile)
    string(i) = current%string
    current => current%next
end do
end subroutine ifile_to_string_array

```

#### 7.1.4 Ifile tools

```

<Ifiles: public>+≡
    public :: ifile_get_length

<Ifiles: subroutines>+≡
    function ifile_get_length (ifile) result (length)
        integer :: length
        type(ifile_t), intent(in) :: ifile
        length = ifile%n_lines
    end function ifile_get_length

```

#### 7.1.5 Line pointers

Instead of the implicit pointer used in ordinary file access, we define explicit pointers, so there can be more than one at a time.

```

<Ifiles: public>+≡
    public :: line_p

<Ifiles: types>+≡
    type :: line_p
        private
        type(line_entry_t), pointer :: p => null ()
    end type line_p

```

Assign a file pointer to the first or last line in an ifile:

```

<Ifiles: public>+≡
    public :: line_init

<Ifiles: subroutines>+≡
    subroutine line_init (line, ifile, back)
        type(line_p), intent(inout) :: line
        type(ifile_t), intent(in) :: ifile
        logical, intent(in), optional :: back
        if (present (back)) then
            if (back) then
                line%p => ifile%last
            else
                line%p => ifile%first
            end if
        else
            line%p => ifile%first
        end if
    end subroutine line_init

```

```

    end if
end subroutine line_init
```

Remove the pointer association:

```

<Ifiles: public>+≡
    public :: line_final
<Ifiles: subroutines>+≡
    subroutine line_final (line)
        type(line_p), intent(inout) :: line
        nullify (line%p)
    end subroutine line_final
```

Go one step forward

```

<Ifiles: public>+≡
    public :: line_advance
<Ifiles: subroutines>+≡
    subroutine line_advance (line)
        type(line_p), intent(inout) :: line
        if (associated (line%p)) line%p => line%p%next
    end subroutine line_advance
```

Go one step backward

```

<Ifiles: public>+≡
    public :: line_backspace
<Ifiles: subroutines>+≡
    subroutine line_backspace (line)
        type(line_p), intent(inout) :: line
        if (associated (line%p)) line%p => line%p%previous
    end subroutine line_backspace
```

Check whether we are accessing a valid line

```

<Ifiles: public>+≡
    public :: line_is_associated
<Ifiles: subroutines>+≡
    function line_is_associated (line) result (ok)
        logical :: ok
        type(line_p), intent(in) :: line
        ok = associated (line%p)
    end function line_is_associated
```

### 7.1.6 Access lines via pointers

We do not need the ifile as an argument to these functions, because the line type will point to an existing ifile.

```

<Ifiles: public>+≡
    public :: line_get_string
```

```

⟨Ifiles: subroutines⟩+≡
    function line_get_string (line) result (string)
        type(string_t) :: string
        type(line_p), intent(in) :: line
        if (associated (line%p)) then
            string = line%p%string
        else
            string = ""
        end if
    end function line_get_string

```

Variant where the line pointer is advanced after reading.

```

⟨Ifiles: public⟩+≡
    public :: line_get_string_advance
⟨Ifiles: subroutines⟩+≡
    function line_get_string_advance (line) result (string)
        type(string_t) :: string
        type(line_p), intent(inout) :: line
        if (associated (line%p)) then
            string = line%p%string
            call line_advance (line)
        else
            string = ""
        end if
    end function line_get_string_advance

⟨Ifiles: public⟩+≡
    public :: line_get_index
⟨Ifiles: subroutines⟩+≡
    function line_get_index (line) result (index)
        integer :: index
        type(line_p), intent(in) :: line
        if (associated (line%p)) then
            index = line%p%index
        else
            index = 0
        end if
    end function line_get_index

⟨Ifiles: public⟩+≡
    public :: line_get_length
⟨Ifiles: subroutines⟩+≡
    function line_get_length (line) result (length)
        integer :: length
        type(line_p), intent(in) :: line
        if (associated (line%p)) then
            length = len (line%p%string)
        else
            length = 0
        end if
    end function line_get_length

```

## 7.2 Lexer

The lexer purpose is to read from a line-separated character input stream (usually a file) and properly chop the stream into lexemes (tokens). [The parser will transform lexemes into meaningful tokens, to be stored in a parse tree, therefore we do not use the term 'token' here.] The input is read line-by-line, but interpreted free-form, except for quotes and the comment syntax. (Fortran 2003 would allow us to use a stream type for reading.)

In an object-oriented approach, we can dynamically create and destroy lexers, including the lexer setup.

The main lexer function is to return a lexeme according to the basic lexer rules (quotes, comments, whitespace, special classes). There is also a routine to write back a lexeme to the input stream (but only once).

For the rules, we separate the possible characters into classes. Whitespace usually consists of blank, tab, and line-feed, where any number of consecutive whitespace is equivalent to one. Quoted strings are enclosed by a pair of quote characters, possibly multiline. Comments are similar to quotes, but interpreted as whitespace. Numbers are identified (not distinguishing real and integer) but not interpreted. Other character classes make up identifiers.

```
<lexers.f90>≡
<File header>

module lexers

<Use strings>
use io_units
use string_utils
use system_defs, only: EOF, EOR
use system_defs, only: LF
use system_defs, only: WHITESPACE_CHARS, LCLETTERS, UCLETTERS, DIGITS
use diagnostics
use ifiles, only: ifile_t
use ifiles, only: line_p, line_is_associated, line_init, line_final
use ifiles, only: line_get_string_advance

<Standard module head>

<Lexer: public>

<Lexer: parameters>

<Lexer: types>

<Lexer: interfaces>

contains

<Lexer: procedures>

end module lexers
```

### 7.2.1 Input streams

For flexible input, we define a generic stream type that refers to either an external file, an external unit which is already open, a string, an `ifile` object (internal file, i.e., string list), or a line pointer to an `ifile` object. The stream type actually follows the idea of a formatted external file, which is line-oriented. Thus, the stream reader always returns a whole record (input line).

Note that only in the string version, the stream contents are stored inside the stream object. In the `ifile` version, the stream contains only the line pointer, while in the external-file case, the line pointer is implicitly created by the runtime library.

```
<Lexer: public>≡
  public :: stream_t

<Lexer: types>≡
  type :: stream_t
    type(string_t), pointer :: filename => null ()
    integer, pointer :: unit => null ()
    type(string_t), pointer :: string => null ()
    type(ifile_t), pointer :: ifile => null ()
    type(line_p), pointer :: line => null ()
    integer :: record = 0
    logical :: eof = .false.
  contains
    <Lexer: stream: TBP>
  end type stream_t
```

The initializers refer to the specific version. The stream should be undefined before calling this.

```
<Lexer: public>+≡
  public :: stream_init

<Lexer: stream: TBP>≡
  generic :: init => &
    stream_init_filename, &
    stream_init_unit, &
    stream_init_string, &
    stream_init_ifile, &
    stream_init_line
  procedure, private :: stream_init_filename
  procedure, private :: stream_init_unit
  procedure, private :: stream_init_string
  procedure, private :: stream_init_ifile
  procedure, private :: stream_init_line

<Lexer: interfaces>≡
  interface stream_init
    module procedure stream_init_filename
    module procedure stream_init_unit
    module procedure stream_init_string
    module procedure stream_init_ifile
    module procedure stream_init_line
  end interface
```

```

⟨Lexer: procedures⟩≡
    subroutine stream_init_filename (stream, filename)
        class(stream_t), intent(out) :: stream
        character(*), intent(in) :: filename
        integer :: unit
        unit = free_unit ()
        open (unit=unit, file=filename, status="old", action="read")
        call stream_init_unit (stream, unit)
        allocate (stream%filename)
        stream%filename = filename
    end subroutine stream_init_filename

    subroutine stream_init_unit (stream, unit)
        class(stream_t), intent(out) :: stream
        integer, intent(in) :: unit
        allocate (stream%unit)
        stream%unit = unit
        stream%eof = .false.
    end subroutine stream_init_unit

    subroutine stream_init_string (stream, string)
        class(stream_t), intent(out) :: stream
        type(string_t), intent(in) :: string
        allocate (stream%string)
        stream%string = string
    end subroutine stream_init_string

    subroutine stream_init_ifile (stream, ifile)
        class(stream_t), intent(out) :: stream
        type(ifile_t), intent(in) :: ifile
        type(line_p) :: line
        call line_init (line, ifile)
        call stream_init_line (stream, line)
        allocate (stream%ifile)
        stream%ifile = ifile
    end subroutine stream_init_ifile

    subroutine stream_init_line (stream, line)
        class(stream_t), intent(out) :: stream
        type(line_p), intent(in) :: line
        allocate (stream%line)
        stream%line = line
    end subroutine stream_init_line

```

The finalizer restores the initial state. If an external file was opened, it is closed.

```

⟨Lexer: public⟩+≡
    public :: stream_final
⟨Lexer: stream: TBP⟩+≡
    procedure :: final => stream_final
⟨Lexer: procedures⟩+≡
    subroutine stream_final (stream)
        class(stream_t), intent(inout) :: stream
        if (associated (stream%filename)) then

```

```

    close (stream%unit)
    deallocate (stream%unit)
    deallocate (stream%filename)
else if (associated (stream%unit)) then
    deallocate (stream%unit)
else if (associated (stream%string)) then
    deallocate (stream%string)
else if (associated (stream%ifile)) then
    call line_final (stream%line)
    deallocate (stream%line)
    deallocate (stream%ifile)
else if (associated (stream%line)) then
    call line_final (stream%line)
    deallocate (stream%line)
end if
end subroutine stream_final

```

This returns the next record from the input stream. Depending on the stream type, the stream pointers are modified: Reading from external unit, the external file is advanced (implicitly). Reading from string, the string is replaced by an empty string. Reading from ifile, the line pointer is advanced. Note that the iostat argument is mandatory.

```

<Lexer: public>+≡
    public :: stream_get_record
<Lexer: procedures>+≡
    subroutine stream_get_record (stream, string, iostat)
        type(stream_t), intent(inout) :: stream
        type(string_t), intent(out) :: string
        integer, intent(out) :: iostat
        if (associated (stream%unit)) then
            if (stream%eof) then
                iostat = EOF
            else
                call get (stream%unit, string, iostat=iostat)
                if (iostat == EOR) then
                    iostat = 0
                    stream%record = stream%record + 1
                end if
                if (iostat == EOF) then
                    iostat = 0
                    stream%eof = .true.
                    if (len (string) /= 0) stream%record = stream%record + 1
                end if
            end if
        else if (associated (stream%string)) then
            if (len (stream%string) /= 0) then
                string = stream%string
                stream%string = ""
                iostat = 0
                stream%record = stream%record + 1
            else
                string = ""
                iostat = EOF
            end if
        end if
    end subroutine stream_get_record

```

```

        end if
    else if (associated (stream%line)) then
        if (line_is_associated (stream%line)) then
            string = line_get_string_advance (stream%line)
            iostat = 0
            stream%record = stream%record + 1
        else
            string = ""
            iostat = EOF
        end if
    else
        call msg_bug (" Attempt to read from uninitialized input stream")
    end if
end subroutine stream_get_record

```

Return the current stream source as a message string.

```

⟨Lexer: public⟩+≡
public :: stream_get_source_info_string

⟨Lexer: procedures⟩+≡
function stream_get_source_info_string (stream) result (string)
    type(string_t) :: string
    type(stream_t), intent(in) :: stream
    character(20) :: buffer
    if (associated (stream%filename)) then
        string = "File '" // stream%filename // "' (unit = "
        write (buffer, "(IO)") stream%unit
        string = string // trim (buffer) // ")"
    else if (associated (stream%unit)) then
        write (buffer, "(IO)") stream%unit
        string = "Unit " // trim (buffer)
    else if (associated (stream%string)) then
        string = "Input string"
    else if (associated (stream%ifile) .or. associated (stream%line)) then
        string = "Internal file"
    else
        string = ""
    end if
end function stream_get_source_info_string

```

Return the index of the record just read as a message string.

```

⟨Lexer: public⟩+≡
public :: stream_get_record_info_string

⟨Lexer: procedures⟩+≡
function stream_get_record_info_string (stream) result (string)
    type(string_t) :: string
    type(stream_t), intent(in) :: stream
    character(20) :: buffer
    string = stream_get_source_info_string (stream)
    if (string /= "") string = string // ","
    write (buffer, "(IO)") stream%record
    string = string // "line " // trim (buffer)
end function stream_get_record_info_string

```

### 7.2.2 Keyword list

The lexer should be capable of identifying a token as a known keyword. To this end, we store a list of keywords:

```
<Lexer: public>+≡
    public :: keyword_list_t

<Lexer: types>+≡
    type :: keyword_entry_t
        private
        type(string_t) :: string
        type(keyword_entry_t), pointer :: next => null ()
    end type keyword_entry_t

    type :: keyword_list_t
        private
        type(keyword_entry_t), pointer :: first => null ()
        type(keyword_entry_t), pointer :: last => null ()
    end type keyword_list_t
```

Add a new string to the keyword list, unless it is already there:

```
<Lexer: public>+≡
    public :: keyword_list_add

<Lexer: procedures>+≡
    subroutine keyword_list_add (keylist, string)
        type(keyword_list_t), intent(inout) :: keylist
        type(string_t), intent(in) :: string
        type(keyword_entry_t), pointer :: k_entry_new
        if (.not. keyword_list_contains (keylist, string)) then
            allocate (k_entry_new)
            k_entry_new%string = string
            if (associated (keylist%first)) then
                keylist%last%next => k_entry_new
            else
                keylist%first => k_entry_new
            end if
            keylist%last => k_entry_new
        end if
    end subroutine keyword_list_add
```

Return true if a string is a keyword.

```
<Lexer: public>+≡
    public :: keyword_list_contains

<Lexer: procedures>+≡
    function keyword_list_contains (keylist, string) result (found)
        type(keyword_list_t), intent(in) :: keylist
        type(string_t), intent(in) :: string
        logical :: found
        found = .false.
```

```

    call check_rec (keylist%first)
contains
    recursive subroutine check_rec (k_entry)
        type(keyword_entry_t), pointer :: k_entry
        if (associated (k_entry)) then
            if (k_entry%string /= string) then
                call check_rec (k_entry%next)
            else
                found = .true.
            end if
        end if
    end subroutine check_rec
end function keyword_list_contains

```

Write the keyword list

```

⟨Lexer: public⟩+≡
    public :: keyword_list_write

⟨Lexer: interfaces⟩+≡
    interface keyword_list_write
        module procedure keyword_list_write_unit
    end interface

⟨Lexer: procedures⟩+≡
    subroutine keyword_list_write_unit (keylist, unit)
        type(keyword_list_t), intent(in) :: keylist
        integer, intent(in) :: unit
        write (unit, "(A)") "Keyword list:"
        if (associated (keylist%first)) then
            call keyword_write_rec (keylist%first)
            write (unit, *)
        else
            write (unit, "(1x,A)") "[empty]"
        end if
contains
    recursive subroutine keyword_write_rec (k_entry)
        type(keyword_entry_t), intent(in), pointer :: k_entry
        if (associated (k_entry)) then
            write (unit, "(1x,A)", advance="no") char (k_entry%string)
            call keyword_write_rec (k_entry%next)
        end if
    end subroutine keyword_write_rec
end subroutine keyword_list_write_unit

```

Clear the keyword list

```

⟨Lexer: public⟩+≡
    public :: keyword_list_final

⟨Lexer: procedures⟩+≡
    subroutine keyword_list_final (keylist)
        type(keyword_list_t), intent(inout) :: keylist
        call keyword_destroy_rec (keylist%first)
        nullify (keylist%last)
contains

```

```

recursive subroutine keyword_destroy_rec (k_entry)
    type(keyword_entry_t), pointer :: k_entry
    if (associated (k_entry)) then
        call keyword_destroy_rec (k_entry%next)
        deallocate (k_entry)
    end if
end subroutine keyword_destroy_rec
end subroutine keyword_list_final

```

### 7.2.3 Lexeme templates

This type is handled like a rudimentary regular expression. It determines the lexer behavior when matching a string. The actual objects made from this type and the corresponding matching routines are listed below.

```

⟨Lexer: types⟩+≡
type :: template_t
private
integer :: type
character(256) :: charset1, charset2
integer :: len1, len2
end type template_t

```

These are the types that valid lexemes can have:

```

⟨Lexer: public⟩+≡
public :: T_KEYWORD, T_IDENTIFIER, T_QUOTED, T_NUMERIC
⟨Lexer: parameters⟩≡
integer, parameter :: T_KEYWORD = 1
integer, parameter :: T_IDENTIFIER = 2, T_QUOTED = 3, T_NUMERIC = 4

```

These are special types:

```

⟨Lexer: parameters⟩+≡
integer, parameter :: EMPTY = 0, WHITESPACE = 10
integer, parameter :: NO_MATCH = 11, IO_ERROR = 12, OVERFLOW = 13
integer, parameter :: UNMATCHED_QUOTE = 14

```

In addition, we have EOF which is a negative integer, normally -1. Printout for debugging:

```

⟨Lexer: procedures⟩+≡
subroutine lexeme_type_write (type, unit)
integer, intent(in) :: type
integer, intent(in) :: unit
select case (type)
case (EMPTY);      write(unit,"(A)",advance="no") " EMPTY      "
case (WHITESPACE); write(unit,"(A)",advance="no") " WHITESPACE "
case (T_IDENTIFIER); write(unit,"(A)",advance="no") " IDENTIFIER "
case (T_QUOTED);   write(unit,"(A)",advance="no") " QUOTED     "
case (T_NUMERIC);  write(unit,"(A)",advance="no") " NUMERIC    "
case (IO_ERROR);   write(unit,"(A)",advance="no") " IO_ERROR    "
case (OVERFLOW);   write(unit,"(A)",advance="no") " OVERFLOW   "
case (UNMATCHED_QUOTE); write(unit,"(A)",advance="no") " UNMATCHEDQ "
case (NO_MATCH);   write(unit,"(A)",advance="no") " NO_MATCH   "
case (EOF);         write(unit,"(A)",advance="no") " EOF        "

```

```

    case default;           write(unit,"(A)",advance="no") " [illegal] "
    end select
end subroutine lexeme_type_write

subroutine template_write (tt, unit)
  type(template_t), intent(in) :: tt
  integer, intent(in) :: unit
  call lexeme_type_write (tt%type, unit)
  write (unit, "(A)", advance="no") "" // tt%charset1(1:tt%len1) // ""
  write (unit, "(A)", advance="no") "" // tt%charset2(1:tt%len2) // ""
end subroutine template_write

```

The matching functions all return the number of matched characters in the provided string. If this number is zero, the match has failed.

The `template` functions are declared `pure` because they appear in `forall` loops below.

A template for whitespace:

```
(Lexer: procedures)+≡
pure function template_whitespace (chars) result (tt)
  character(*), intent(in) :: chars
  type(template_t) :: tt
  tt = template_t (WHITESPACE, chars, "", len(chars), 0)
end function template_whitespace
```

Just match the string against the character set.

```
(Lexer: procedures)+≡
subroutine match_whitespace (tt, s, n)
  type(template_t), intent(in) :: tt
  character(*), intent(in) :: s
  integer, intent(out) :: n
  n = verify (s, tt%charset1(1:tt%len1)) - 1
  if (n < 0) n = len (s)
end subroutine match_whitespace
```

A template for normal identifiers. To match, a lexeme should have a first character in class `chars1` and an arbitrary number of further characters in class `chars2`. If the latter is empty, we are looking for a single-character lexeme.

```
(Lexer: procedures)+≡
pure function template_identifier (chars1, chars2) result (tt)
  character(*), intent(in) :: chars1, chars2
  type(template_t) :: tt
  tt = template_t (T_IDENTIFIER, chars1, chars2, len(chars1), len(chars2))
end function template_identifier
```

Here, the first letter must match, the others may or may not.

```
(Lexer: procedures)+≡
subroutine match_identifier (tt, s, n)
  type(template_t), intent(in) :: tt
  character(*), intent(in) :: s
  integer, intent(out) :: n
  if (verify (s(1:1), tt%charset1(1:tt%len1)) == 0) then
```

```

n = verify (s(2:), tt%charset2(1:tt%len2))
if (n == 0) n = len (s)
else
  n = 0
end if
end subroutine match_identifier

```

A template for quoted strings. The same template applies for comments. The first character set indicates the left quote (could be a sequence of several characters), the second one the matching right quote.

*(Lexer: procedures)*+≡

```

pure function template_quoted (chars1, chars2) result (tt)
  character(*), intent(in) :: chars1, chars2
  type(template_t) :: tt
  tt = template_t (T_QUOTED, chars1, chars2, len (chars1), len (chars2))
end function template_quoted

```

Here, the beginning of the string must exactly match the first character set, then we look for the second one. If found, return. If there is a first quote but no second one, return a negative number, indicating this error condition.

*(Lexer: procedures)*+≡

```

subroutine match_quoted (tt, s, n, range)
  type(template_t), intent(in) :: tt
  character(*), intent(in) :: s
  integer, intent(out) :: n
  integer, dimension(2), intent(out) :: range
  character(tt%len1) :: ch1
  character(tt%len2) :: ch2
  integer :: i
  ch1 = tt%charset1
  if (s(1:tt%len1) == ch1) then
    ch2 = tt%charset2
    do i = tt%len1 + 1, len (s) - tt%len2 + 1
      if (s(i:i+tt%len2-1) == ch2) then
        n = i + tt%len2 - 1
        range(1) = tt%len1 + 1
        range(2) = i - 1
        return
      end if
    end do
    n = -1
    range = 0
  else
    n = 0
    range = 0
  end if
end subroutine match_quoted

```

A template for real numbers. The first character set is the set of allowed exponent letters. In accordance with the other functions we return the lexeme as a string but do not read it.

*(Lexer: procedures)*+≡

```

pure function template_numeric (chars) result (tt)
    character(*), intent(in) :: chars
    type(template_t) :: tt
    tt = template_t (T_NUMERIC, chars, "", len (chars), 0)
end function template_numeric

```

A numeric lexeme may be real or integer. We purposely do not allow for a preceding sign. If the number is followed by an exponent, this is included, otherwise the rest is ignored.

There is a possible pitfall with this behavior: while the string `1e3` will be interpreted as a single number, the analogous string `1a3` will be split into the number `1` and an identifier `a3`. There is no easy way around such an ambiguity. We should make sure that the syntax does not contain identifiers like `a3` or `e3`.

*(Lexer: procedures)* +≡

```

subroutine match_numeric (tt, s, n)
    type(template_t), intent(in) :: tt
    character(*), intent(in) :: s
    integer, intent(out) :: n
    integer :: i, n0
    character(10), parameter :: digits = "0123456789"
    character(2), parameter :: signs = "-+"
    n = verify (s, digits) - 1
    if (n < 0) then
        n = 0
        return
    else if (s(n+1:n+1) == ".") then
        i = verify (s(n+2:), digits) - 1
        if (i < 0) then
            n = len (s)
            return
        else if (i > 0 .or. n > 0) then
            n = n + 1 + i
        end if
    end if
    n0 = n
    if (n > 0) then
        if (verify (s(n+1:n+1), tt%charset1(1:tt%len1)) == 0) then
            n = n + 1
            if (verify (s(n+1:n+1), signs) == 0) n = n + 1
            i = verify (s(n+1:), digits) - 1
            if (i < 0) then
                n = len (s)
            else if (i == 0) then
                n = n0
            else
                n = n + i
            end if
        end if
    end if
end subroutine match_numeric

```

The generic matching routine. With Fortran 2003 we would define separate types and use a SELECT TYPE instead.

```

<Lexer: procedures>+≡
    subroutine match_template (tt, s, n, range)
        type(template_t), intent(in) :: tt
        character(*), intent(in) :: s
        integer, intent(out) :: n
        integer, dimension(2), intent(out) :: range
        select case (tt%type)
        case (WHITESPACE)
            call match_whitespace (tt, s, n)
            range = 0
        case (T_IDENTIFIER)
            call match_identifier (tt, s, n)
            range(1) = 1
            range(2) = len_trim (s)
        case (T_QUOTED)
            call match_quoted (tt, s, n, range)
        case (T_NUMERIC)
            call match_numeric (tt, s, n)
            range(1) = 1
            range(2) = len_trim (s)
        case default
            call msg_bug ("Invalid lexeme template encountered")
        end select
    end subroutine match_template

```

Match against an array of templates. Return the index of the first template that matches together with the number of characters matched and the range of the relevant substring. If all fails, these numbers are zero.

```

<Lexer: procedures>+≡
    subroutine match (tt, s, n, range, ii)
        type(template_t), dimension(:), intent(in) :: tt
        character(*), intent(in) :: s
        integer, intent(out) :: n
        integer, dimension(2), intent(out) :: range
        integer, intent(out) :: ii
        integer :: i
        do i = 1, size (tt)
            call match_template (tt(i), s, n, range)
            if (n /= 0) then
                ii = i
                return
            end if
        end do
        n = 0
        ii = 0
    end subroutine match

```

#### 7.2.4 The lexer setup

This object contains information about character classes. As said above, one class consists of quoting chars (matching left and right), another one of comment chars (similar), a class of whitespace, and several classes of characters

that make up identifiers. When creating the lexer setup, the character classes are transformed into lexeme templates which are to be matched in a certain predefined order against the input stream.

BLANK should always be taken as whitespace, some things may depend on this. TAB is also fixed by convention, but may in principle be modified. Newline (DOS!) and linefeed are also defined as whitespace. The lexer setup, containing the list of lexeme templates. No defaults yet. The type with index zero will be assigned to the NO\_MATCH lexeme.

The keyword list is not stored, just a pointer to it. We anticipate that the keyword list is part of the syntax table, and the lexer needs not alter it. Furthermore, the lexer is typically finished before the syntax table is.

```
<Lexer: parameters>+≡
    integer, parameter :: CASE_KEEP = 0, CASE_UP = 1, CASE_DOWN = 2
```

```
<Lexer: types>+≡
    type :: lexer_setup_t
        private
        type(template_t), dimension(:), allocatable :: tt
        integer, dimension(:), allocatable :: type
        integer :: keyword_case = CASE_KEEP
        type(keyword_list_t), pointer :: keyword_list => null ()
    end type lexer_setup_t
```

Fill the lexer setup object. Some things are hardcoded here (whitespace, alphanumeric identifiers), some are free: comment chars (but these must be single, and comments must be terminated by line-feed), quote chars and matches (must be single), characters to be read as one-character lexeme, special classes (characters of one class that should be glued together as identifiers).

```
<Lexer: procedures>+≡
    subroutine lexer_setup_init (setup, &
        comment_chars, quote_chars, quote_match, &
        single_chars, special_class, &
        keyword_list, upper_case_keywords)
        type(lexer_setup_t), intent(inout) :: setup
        character(*), intent(in) :: comment_chars
        character(*), intent(in) :: quote_chars, quote_match
        character(*), intent(in) :: single_chars
        character(*), dimension(:), intent(in) :: special_class
        type(keyword_list_t), pointer :: keyword_list
        logical, intent(in), optional :: upper_case_keywords
        integer :: n, i
        if (present (upper_case_keywords)) then
            if (upper_case_keywords) then
                setup%keyword_case = CASE_UP
            else
                setup%keyword_case = CASE_DOWN
            end if
        else
            setup%keyword_case = CASE_KEEP
        end if
        n = 1 + len (comment_chars) + len (quote_chars) + 1 &
```

```

        + len (single_chars) + size (special_class) + 1
allocate (setup%tt(n))

end subroutine lexer_setup_init

```

The destructor is needed only if the object is not itself part of an allocatable array

```

⟨Lexer: procedures⟩+≡
    subroutine lexer_setup_final (setup)
        type(lexer_setup_t), intent(inout) :: setup
        deallocate (setup%tt, setup%type)
        setup%keyword_list => null ()
    end subroutine lexer_setup_final

```

For debugging: Write the lexer setup

```

⟨Lexer: procedures⟩+≡
    subroutine lexer_setup_write (setup, unit)

```

```

type(lexer_setup_t), intent(in) :: setup
integer, intent(in) :: unit
integer :: i
write (unit, "(A)") "Lexer setup:"
if (allocated (setup%tt)) then
    do i = 1, size (setup%tt)
        call template_write (setup%tt(i), unit)
        write (unit, '(A)', advance = "no") " -> "
        call lexeme_type_write (setup%type(i), unit)
        write (unit, *)
    end do
else
    write (unit, *) "[empty]"
end if
if (associated (setup%keyword_list)) then
    call keyword_list_write (setup%keyword_list, unit)
end if
end subroutine lexer_setup_write

```

### 7.2.5 The lexeme type

An object of this type is returned by the lexer. Apart from the lexeme string, it gives information about the relevant substring (first and last character index) and the lexeme type. Interpreting the string is up to the parser.

```

<Lexer: public>+≡
    public :: lexeme_t
<Lexer: types>+≡
    type :: lexeme_t
        private
        integer :: type = EMPTY
        type(string_t) :: s
        integer :: b = 0, e = 0
    end type lexeme_t

```

Debugging aid:

```

<Lexer: public>+≡
    public :: lexeme_write
<Lexer: procedures>+≡
    subroutine lexeme_write (t, unit)
        type(lexeme_t), intent(in) :: t
        integer, intent(in) :: unit
        integer :: u
        u = given_output_unit (unit);  if (u < 0)  return
        select case (t%type)
        case (T_KEYWORD)
            write (u, *) "KEYWORD:      '" // char (t%s) // "'"
        case (T_IDENTIFIER)
            write (u, *) "IDENTIFIER: '" // char (t%s) // "'"
        case (T_QUOTED)
            write (u, *) "QUOTED:      '" // char (t%s) // "'"
        case (T_NUMERIC)

```

```

        write (u, *) "NUMERIC:    '" // char (t%s) // "'"
case (UNMATCHED_QUOTE)
        write (u, *) "Unmatched quote: // char (t%s)
case (OVERFLOW); write (u, *) "Overflow: // char (t%s)
case (EMPTY);    write (u, *) "Empty lexeme"
case (NO_MATCH); write (u, *) "No match"
case (IO_ERROR); write (u, *) "IO error"
case (EOF);      write (u, *) "EOF"
case default
        write (u, *) "Error"
end select
end subroutine lexeme_write

```

Store string and type in a lexeme. The range determines the beginning and end of the relevant part of the string. Check for a keyword.

```

<Lexer: procedures>+≡
subroutine lexeme_set (t, keyword_list, s, range, type, keyword_case)
    type(lexeme_t), intent(out) :: t
    type(keyword_list_t), pointer :: keyword_list
    type(string_t), intent(in) :: s
    type(string_t) :: keyword
    integer, dimension(2), intent(in) :: range
    integer, intent(in) :: type
    integer, intent(in), optional :: keyword_case
    t%type = type
    if (present (keyword_case)) then
        select case (keyword_case)
        case (CASE_KEEP);   keyword = s
        case (CASE_UP);     keyword = upper_case (s)
        case (CASE_DOWN);   keyword = lower_case (s)
        end select
    else
        keyword = s
    end if
    if (type == T_IDENTIFIER) then
        if (associated (keyword_list)) then
            if (keyword_list_contains (keyword_list, keyword)) &
                t%type = T_KEYWORD
            end if
        end if
        select case (t%type)
        case (T_KEYWORD);  t%s = keyword
        case default;       t%s = s
        end select
        t%b = range(1)
        t%e = range(2)
    end if
end subroutine lexeme_set

subroutine lexeme_clear (t)
    type(lexeme_t), intent(out) :: t
    t%type = EMPTY
    t%s = ""
end subroutine lexeme_clear

```

Retrieve the lexeme string, the relevant part of it, and the type. The last function returns true if there is a break condition reached (error or EOF).

```
(Lexer: public)+≡
  public :: lexeme_get_string
  public :: lexeme_get_contents
  public :: lexeme_get_delimiters
  public :: lexeme_get_type

(Lexer: procedures)+≡
  function lexeme_get_string (t) result (s)
    type(string_t) :: s
    type(lexeme_t), intent(in) :: t
    s = t%s
  end function lexeme_get_string

  function lexeme_get_contents (t) result (s)
    type(string_t) :: s
    type(lexeme_t), intent(in) :: t
    s = extract (t%s, t%b, t%e)
  end function lexeme_get_contents

  function lexeme_get_delimiters (t) result (del)
    type(string_t), dimension(2) :: del
    type(lexeme_t), intent(in) :: t
    del(1) = extract (t%s, finish = t%b-1)
    del(2) = extract (t%s, start = t%e+1)
  end function lexeme_get_delimiters

  function lexeme_get_type (t) result (type)
    integer :: type
    type(lexeme_t), intent(in) :: t
    type = t%type
  end function lexeme_get_type
```

Check for a generic break condition (error/eof) and for eof in particular.

```
(Lexer: public)+≡
  public :: lexeme_is_break
  public :: lexeme_is_eof

(Lexer: procedures)+≡
  function lexeme_is_break (t) result (break)
    logical :: break
    type(lexeme_t), intent(in) :: t
    select case (t%type)
      case (EOF, IO_ERROR, OVERFLOW, NO_MATCH)
        break = .true.
      case default
        break = .false.
    end select
  end function lexeme_is_break

  function lexeme_is_eof (t) result (ok)
    logical :: ok
```

```

    type(lexeme_t), intent(in) :: t
    ok = t%type == EOF
end function lexeme_is_eof

```

### 7.2.6 The lexer object

We store the current lexeme and the current line. The line buffer is set each time a new line is read from file. The working buffer has one character more, to hold any trailing blank. Pointers to line and column are for debugging, they will be used to make up readable error messages for the parser.

```

<Lexer: public>+≡
    public :: lexer_t

<Lexer: types>+≡
    type :: lexer_t
        private
        type(lexer_setup_t) :: setup
        type(stream_t), pointer :: stream => null ()
        type(lexeme_t) :: lexeme
        type(string_t) :: previous_line2
        type(string_t) :: previous_line1
        type(string_t) :: current_line
        integer :: lines_read = 0
        integer :: current_column = 0
        integer :: previous_column = 0
        type(string_t) :: buffer
        type(lexer_t), pointer :: parent => null ()
contains
    <Lexer: lexer: TBP>
end type lexer_t

Create-setup wrapper
<Lexer: public>+≡
    public :: lexer_init

<Lexer: lexer: TBP>≡
    procedure :: init => lexer_init

<Lexer: procedures>+≡
    subroutine lexer_init (lexer, &
        comment_chars, quote_chars, quote_match, &
        single_chars, special_class, &
        keyword_list, upper_case_keywords, &
        parent)
        class(lexer_t), intent(inout) :: lexer
        character(*), intent(in) :: comment_chars
        character(*), intent(in) :: quote_chars, quote_match
        character(*), intent(in) :: single_chars
        character(*), dimension(:), intent(in) :: special_class
        type(keyword_list_t), pointer :: keyword_list
        logical, intent(in), optional :: upper_case_keywords
        type(lexer_t), target, intent(in), optional :: parent
        call lexer_setup_init (lexer%setup, &
            comment_chars = comment_chars, &

```

```

    quote_chars = quote_chars, &
    quote_match = quote_match, &
    single_chars = single_chars, &
    special_class = special_class, &
    keyword_list = keyword_list, &
    upper_case_keywords = upper_case_keywords)
  if (present (parent))  lexer%parent => parent
  call lexer_clear (lexer)
end subroutine lexer_init

```

Clear the lexer state, but not the setup. This should be done when the lexing starts, but it is not known whether the lexer was used before.

```

⟨Lexer: public⟩+≡
  public :: lexer_clear

⟨Lexer: lexer: TBP⟩+≡
  procedure :: clear => lexer_clear

⟨Lexer: procedures⟩+≡
  subroutine lexer_clear (lexer)
    class(lexer_t), intent(inout) :: lexer
    call lexeme_clear (lexer%lexeme)
    lexer%previous_line2 = ""
    lexer%previous_line1 = ""
    lexer%current_line = ""
    lexer%lines_read = 0
    lexer%current_column = 0
    lexer%previous_column = 0
    lexer%buffer = ""
  end subroutine lexer_clear

```

Reset lexer state and delete setup

```

⟨Lexer: public⟩+≡
  public :: lexer_final

⟨Lexer: lexer: TBP⟩+≡
  procedure :: final => lexer_final

⟨Lexer: procedures⟩+≡
  subroutine lexer_final (lexer)
    class(lexer_t), intent(inout) :: lexer
    call lexer%clear ()
    call lexer_setup_final (lexer%setup)
  end subroutine lexer_final

```

### 7.2.7 The lexer routine

For lexing we need to associate an input stream to the lexer.

```

⟨Lexer: public⟩+≡
  public :: lexer_assign_stream

⟨Lexer: lexer: TBP⟩+≡
  procedure :: assign_stream => lexer_assign_stream

```

```

⟨Lexer: procedures⟩+≡
    subroutine lexer_assign_stream (lexer, stream)
        class(lexer_t), intent(inout) :: lexer
        type(stream_t), intent(in), target :: stream
        lexer%stream => stream
    end subroutine lexer_assign_stream

```

The lexer. The lexer function takes the lexer and returns the currently stored lexeme. If there is none, it is read from buffer, matching against the lexeme templates in the lexer setup. Empty lexemes, i.e., comments and whitespace, are discarded and the buffer is read again until we have found a nonempty lexeme (which may also be EOF or an error condition).

The initial state of the lexer contains an empty lexeme, so reading from buffer is forced. The empty state is restored after returning the lexeme. A nonempty lexeme is present in the lexer only if `lex_back` has been executed before.

The workspace is the `lexer%buffer`, treated as a sort of input stream. We chop off lexemes from the beginning, adjusting the buffer to the left. Whenever the buffer is empty, or we are matching against an open quote which has not terminated, we read a new line and append it to the right. This may result in special conditions, which for simplicity are also returned as lexemes: I/O error, buffer overflow, end of file. If the latter happens during reading a quoted string, we return an unmatched-quote lexeme. Obviously, the special-condition lexemes have to be caught by the parser.

Note that reading further lines is only necessary when reading a quoted string. Otherwise, the line-feed that ends each line is interpreted as whitespace which terminates a preceding lexeme, so there are no other valid multiline lexemes.

To enable meaningful error messages, we also keep track of the line number of the last line read, and the beginning and the end of the current lexeme with respect to this line.

The lexer is implemented as a function that returns the next lexeme (i.e., token). It uses the `lexer` setup and modifies the buffers and pointers stored within the lexer, a side effect. The lexer reads from an input stream object, which also is modified by this reading, e.g., a line pointer is advanced.

```

⟨Lexer: public⟩+≡
    public :: lex

⟨Lexer: procedures⟩+≡
    subroutine lex (lexeme, lexer)
        type(lexeme_t), intent(out) :: lexeme
        type(lexer_t), intent(inout) :: lexer
        integer :: iostat1, iostat2
        integer :: pos
        integer, dimension(2) :: range
        integer :: template_index, type
        if (.not. associated (lexer%stream)) &
            call msg_bug ("Lexer called without assigned stream")
        GET_LEXEME: do while (lexeme_get_type (lexer%lexeme) == EMPTY)
            if (len (lexer%buffer) /= 0) then
                iostat1 = 0

```

```

else
    call lexer_read_line (lexer, iostat1)
end if
select case (iostat1)
case (0)
    MATCH_BUFFER: do
        call match (lexer%setup%tt, char (lexer%buffer), &
                    pos, range, template_index)
        if (pos >= 0) then
            type = lexer%setup%type(template_index)
            exit MATCH_BUFFER
        else
            pos = 0
            call lexer_read_line (lexer, iostat2)
            select case (iostat2)
                case (EOF); type = UNMATCHED_QUOTE; exit MATCH_BUFFER
                case (1);   type = IO_ERROR;           exit MATCH_BUFFER
                case (2);   type = OVERFLOW;          exit MATCH_BUFFER
            end select
        end if
    end do MATCH_BUFFER
case (EOF); type = EOF
case (1);   type = IO_ERROR
case (2);   type = OVERFLOW
end select
call lexeme_set (lexer%lexeme, lexer%setup%keyword_list, &
                 extract (lexer%buffer, finish=pos), range, type, &
                 lexer%setup%keyword_case)
lexer%buffer = remove (lexer%buffer, finish=pos)
lexer%previous_column = lexer%current_column
lexer%current_column = lexer%current_column + pos
end do GET_LEXEME
lexeme = lexer%lexeme
call lexeme_clear (lexer%lexeme)
end subroutine lex

```

Read a line and append it to the input buffer. If the input buffer overflows, return `iostat=2`. Otherwise, `iostat=1` indicates an I/O error, and `iostat=-1` the EOF.

The input stream may either be an external unit or a `ifile` object. In the latter case, a line is read and the line pointer is advanced.

Note that inserting LF between input lines is the Unix convention. Since we are doing this explicitly when gluing lines together, we can pattern-match against LF without having to worry about the system.

*(Lexer: procedures)*+≡

```

subroutine lexer_read_line (lexer, iostat)
    type(lexer_t), intent(inout) :: lexer
    integer, intent(out) :: iostat
    type(string_t) :: current_line
    current_line = lexer%current_line
    call stream_get_record (lexer%stream, lexer%current_line, iostat)
    if (iostat == 0) then
        lexer%lines_read = lexer%lines_read + 1

```

```

lexer%previous_line2 = lexer%previous_line1
lexer%previous_line1 = current_line
lexer%buffer = lexer%buffer // lexer%current_line // LF
lexer%previous_column = 0
lexer%current_column = 0
end if
end subroutine lexer_read_line

```

Once in a while we have read one lexeme to many, which can be pushed back into the input stream. Do not do this more than once.

```

⟨Lexer: public⟩+≡
    public :: lexer_put_back

⟨Lexer: procedures⟩+≡
    subroutine lexer_put_back (lexer, lexeme)
        type(lexer_t), intent(inout) :: lexer
        type(lexeme_t), intent(in) :: lexeme
        if (lexeme_get_type (lexer%lexeme) == EMPTY) then
            lexer%lexeme = lexeme
        else
            call msg_bug (" Lexer: lex_back fails; probably called twice")
        end if
    end subroutine lexer_put_back

```

### 7.2.8 Diagnostics

For debugging: print just the setup

```

⟨Lexer: public⟩+≡
    public :: lexer_write_setup

⟨Lexer: procedures⟩+≡
    subroutine lexer_write_setup (lexer, unit)
        type(lexer_t), intent(in) :: lexer
        integer, intent(in), optional :: unit
        integer :: u
        u = given_output_unit (unit);  if (u < 0)  return
        call lexer_setup_write (lexer%setup, u)
    end subroutine lexer_write_setup

```

This is useful for error printing: show the current line with index and a pointer to the current column within the line.

```

⟨Lexer: public⟩+≡
    public :: lexer_show_location

⟨Lexer: procedures⟩+≡
    subroutine lexer_show_location (lexer)
        type(lexer_t), intent(in) :: lexer
        type(string_t) :: loc_str
        if (associated (lexer%parent)) then
            call lexer_show_source (lexer%parent)
            call msg_message ("[includes]")
        else

```

```

    call msg_message ()
end if
if (associated (lexer%stream)) then
    call msg_message &
        (char (stream_get_record_info_string (lexer%stream)) // ":")
end if
if (lexer%lines_read >= 4)  call msg_result ("[...]")
if (lexer%lines_read >= 3)  call msg_result (char (lexer%previous_line2))
if (lexer%lines_read >= 2)  call msg_result (char (lexer%previous_line1))
if (lexer%lines_read >= 1) then
    call msg_result (char (lexer%current_line))
    loc_str = repeat (" ", lexer%previous_column)
    loc_str = loc_str // "^"
    if (lexer%current_column > lexer%previous_column) then
        loc_str = loc_str &
            // repeat ("-", max (lexer%current_column &
            - lexer%previous_column - 1, 0)) &
            // "^^"
    end if
    call msg_result (char (loc_str))
end if
end subroutine lexer_show_location

```

This just prints the current stream source.

```

⟨Lexer: procedures⟩+≡
recursive subroutine lexer_show_source (lexer)
type(lexer_t), intent(in) :: lexer
if (associated (lexer%parent)) then
    call lexer_show_source (lexer%parent)
    call msg_message ("[includes]")
else
    call msg_message ()
end if
if (associated (lexer%stream)) then
    call msg_message &
        (char (stream_get_source_info_string (lexer%stream)) // ":")
end if
end subroutine lexer_show_source

```

### 7.2.9 Unit tests

Test module, followed by the corresponding implementation module.

```

⟨lexers_ut.f90⟩≡
⟨File header⟩

```

```

module lexers_ut
use unit_tests

```

⟨Standard module head⟩

⟨Lexer: public test⟩

```

contains

⟨Lexer: test driver⟩

end module lexers_ut

⟨lexers_uti.f90⟩≡
⟨File header⟩

module lexers_uti

⟨Use strings⟩

use lexers

⟨Standard module head⟩

⟨Lexer: test declarations⟩

contains

⟨Lexer: tests⟩

end module lexers_uti

```

API: driver for the unit tests below.

```

⟨Lexer: public test⟩≡
public :: lexer_test

⟨Lexer: test driver⟩≡
subroutine lexer_test (u, results)
integer, intent(in) :: u
type(test_results_t), intent(inout) :: results
⟨Lexer: execute tests⟩
end subroutine lexer_test

```

Test the lexer by lexing and printing all lexemes from unit u, one per line, using preset conventions.

```

⟨Lexer: execute tests⟩≡
call test (lexer_1, "lexer_1", &
"check lexer", u, results)

⟨Lexer: test declarations⟩≡
public :: lexer_1

⟨Lexer: tests⟩≡
subroutine lexer_1 (u)
integer, intent(in) :: u
type(lexer_t), target :: lexer
type(stream_t), target :: stream
type(string_t) :: string
type(lexeme_t) :: lexeme
string = "abcdefghijkl"
call lexer_init (lexer, &
comment_chars = "", &

```

```
quote_chars = "<'\"", &
quote_match = ">'\"", &
single_chars = "?*+|=,()", &
special_class = ["."], &
keyword_list = null ())
call stream_init (stream, string)
call lexer_assign_stream (lexer, stream)
do
    call lex (lexeme, lexer)
    call lexeme_write (lexeme, u)
    if (lexeme_is_break (lexeme))  exit
end do
call stream_final (stream)
call lexer_final (lexer)
end subroutine lexer_1
```

## 7.3 Syntax rules

This module provides tools to handle syntax rules in an abstract way.

```
(syntax_rules.f90)≡
  ⟨File header⟩

  module syntax_rules

    ⟨Use strings⟩
    use io_units
    use diagnostics
    use system_defs, only: LCLETTERS, UCLETTERS, DIGITS
    use ifiles, only: line_p, line_init, line_get_string_advance, line_final
    use ifiles, only: ifile_t, ifile_get_length
    use lexers

    ⟨Standard module head⟩

    ⟨Syntax: public⟩

    ⟨Syntax: parameters⟩

    ⟨Syntax: types⟩

    ⟨Syntax: interfaces⟩

    contains

    ⟨Syntax: subroutines⟩

  end module syntax_rules
```

### 7.3.1 Syntax rules

Syntax rules are used by the parser. They determine how to translate the stream of lexemes as returned by the lexer into the parse tree node. A rule may be terminal, i.e., replace a matching lexeme into a terminal node. The node will contain the lexeme interpreted as a recognized token:

- a keyword: unquoted fixed character string;
- a real number, to be determined at runtime;
- an integer, to be determined at runtime;
- a boolean value, to be determined at runtime;
- a quoted token (e.g., string), to be determined at runtime;
- an identifier (unquoted string that is not a recognized keyword), to be determined at runtime.

It may be nonterminal, i.e., contain a sequence of child rules. These are matched consecutively (and recursively) against the input stream; the resulting node will be a branch node.

- the file, i.e., the input stream as a whole;
- a sequence of syntax elements, where the last syntax element may be optional, or optional repetitive;

Sequences carry a flag that tells whether the last child is optional or may be repeated an arbitrary number of times, corresponding to the regexp modifiers ?, \*, and +.

We also need an alternative rule; this will be replaced by the node generated by one of its children that matches; thus, it does not create a node of its own.

- an alternative of syntax elements.

We also define special types of sequences as convenience macros:

- a list: a sequence where the elements are separated by a separator keyword (e.g., commas), the separators are thrown away when parsing the list;
- a group: a sequence of three tokens, where the first and third ones are left and right delimiters, the delimiters are thrown away;
- an argument list: a delimited list, containing both delimiters and separators.

It would be great to have a polymorphic type for this purpose, but until Fortran 2003 is out we have to emulate this.

Here are the syntax element codes:

```
(Syntax: public)≡
public :: S_UNKNOWN
public :: S_LOGICAL, S_INTEGER, S_REAL, S_COMPLEX, S_QUOTED
public :: S_IDENTIFIER, S_KEYWORD
public :: S_SEQUENCE, S_LIST, S_GROUP, S_ARGS
public :: S_ALTERNATIVE
public :: S_IGNORE

(Syntax: parameters)≡
integer, parameter :: &
  S_UNKNOWN = 0, &
  S_LOGICAL = 1, S_INTEGER = 2, S_REAL = 3, S_COMPLEX = 4, &
  S_QUOTED = 5, S_IDENTIFIER = 6, S_KEYWORD = 7, &
  S_SEQUENCE = 8, S_LIST = 9, S_GROUP = 10, S_ARGS = 11, &
  S_ALTERNATIVE = 12, &
  S_IGNORE = 99
```

We need arrays of rule pointers, therefore this construct.

```
(Syntax: types)≡
type :: rule_p
  private
  type(syntax_rule_t), pointer :: p => null ()
end type rule_p
```

Return the association status of the rule pointer:

```
<Syntax: subroutines>≡
  elemental function rule_is_associated (rp) result (ok)
    logical :: ok
    type (rule_p), intent(in) :: rp
    ok = associated (rp%p)
  end function rule_is_associated
```

The rule type is one of the types listed above, represented by an integer code. The keyword, for a non-keyword rule, is an identifier used for the printed syntax table. The array of children is needed for nonterminal rules. In that case, there is a modifier for the last element (blank, "?", "\*", or "+"), mirrored in the flags `opt` and `rep`. Then, we have the character constants used as separators and delimiters for this rule. Finally, the `used` flag can be set to indicate that this rule is the child of another rule.

Note: we separate `delimiter_left` and `delimiter_right` because the previous fixed dimension(2) array triggered an ICE in gfortran-4.9.2.

```
<Syntax: types>+≡
  public :: syntax_rule_t

<Syntax: types>+≡
  type :: syntax_rule_t
    private
    integer :: type = S_UNKNOWN
    logical :: used = .false.
    type(string_t) :: keyword
    type(string_t) :: separator
    type(string_t) :: delimiter_left, delimiter_right
    type(rule_p), dimension(:), allocatable :: child
    character(1) :: modifier = ""
    logical :: opt = .false., rep = .false.
  contains
    <Syntax: syntax rule: TBP>
  end type syntax_rule_t
```

Initializer: Set type and key for a rule, but do not (yet) allocate anything.  
Finalizer: not needed (no pointer components).

```
<Syntax: subroutines>+≡
  subroutine syntax_rule_init (rule, key, type)
    type(syntax_rule_t), intent(inout) :: rule
    type(string_t), intent(in) :: key
    integer, intent(in) :: type
    rule%keyword = key
    rule%type = type
    select case (rule%type)
    case (S_GROUP)
      call syntax_rule_set_delimiter (rule)
    case (S_LIST)
      call syntax_rule_set_separator (rule)
    case (S_ARGS)
      call syntax_rule_set_delimiter (rule)
      call syntax_rule_set_separator (rule)
```

```

    end select
end subroutine syntax_rule_init

```

These characters will not be enclosed in quotes when writing syntax rules:

```

<Syntax: parameters>+≡
    character(*), parameter :: &
        UNQUOTED = "()", |_"//LCLETTERS//UCLETTERS//DIGITS

```

### 7.3.2 I/O

Write an account of the rule. Setting `short` true will suppress the node type. Setting `key_only` true will suppress the definition. Setting `advance` false will suppress the trailing newline.

```

<Syntax: public>+≡
    public :: syntax_rule_write

<Syntax: syntax rule: TBP>≡
    procedure :: write => syntax_rule_write

<Syntax: subroutines>+≡
    subroutine syntax_rule_write (rule, unit, short, key_only, advance)
        class(syntax_rule_t), intent(in) :: rule
        integer, intent(in), optional :: unit

end if
end subroutine write_sequence
end subroutine syntax_rule_write

```

In the printed representation, the keyword strings are enclosed as <...>, unless they are bare keywords. Bare keywords are enclosed as '...' if they contain a character which is not a letter, digit, or underscore. If they contain a single-quote character, they are enclosed as "...". (A keyword must not contain both single- and double-quotes.)

*(Syntax: subroutines)*+≡

```

function wkey (rule) result (string)
    type(string_t) :: string
    type(syntax_rule_t), intent(in) :: rule
    select case (rule%type)
    case (S_KEYWORD)
        if (verify (rule%keyword, UNQUOTED) == 0) then
            string = rule%keyword
        else if (scan (rule%keyword, '') == 0) then
            string = '"' // rule%keyword // ""
        else
            string = '\'' // rule%keyword // '\''
        end if
    case default
        string = "<" // rule%keyword // ">"
    end select
end function wkey

```

### 7.3.3 Completing syntax rules

Set the separator and delimiter entries, using defaults:

*(Syntax: subroutines)*+≡

```

subroutine syntax_rule_set_separator (rule, separator)
    type(syntax_rule_t), intent(inout) :: rule
    type(string_t), intent(in), optional :: separator
    if (present (separator)) then
        rule%separator = separator
    else
        rule%separator = ","
    end if
end subroutine syntax_rule_set_separator

```

```

subroutine syntax_rule_set_delimiter (rule, delimiter)
  type(syntax_rule_t), intent(inout) :: rule
  type(string_t), dimension(2), intent(in), optional :: delimiter
  if (present (delimiter)) then
    rule%delimiter_left = delimiter(1)
    rule%delimiter_right = delimiter(2)
  else
    rule%delimiter_left = "("
    rule%delimiter_right = ")"
  end if
end subroutine syntax_rule_set_delimiter

```

Set the modifier entry and corresponding flags:

```

<Syntax: subroutines>+≡
function is_modifier (string) result (ok)
  logical :: ok
  type(string_t), intent(in) :: string
  select case (char (string))
  case (" ", "?", "*", "+");  ok = .true.
  case default;               ok = .false.
  end select
end function is_modifier

subroutine syntax_rule_set_modifier (rule, modifier)
  type(syntax_rule_t), intent(inout) :: rule
  type(string_t), intent(in) :: modifier
  rule%modifier = char (modifier)
  select case (rule%modifier)
  case (" ")
  case ("?");  rule%opt = .true.
  case ("*");  rule%opt = .true.;  rule%rep = .true.
  case ("+");  rule%rep = .true.
  case default
    call msg_bug (" Syntax: sequence modifier '" // rule%modifier &
                 // "' is not one of '+, '*', '?'")
  end select
end subroutine syntax_rule_set_modifier

```

Check a finalized rule for completeness

```

<Syntax: subroutines>+≡
subroutine syntax_rule_check (rule)
  type(syntax_rule_t), intent(in) :: rule
  if (rule%keyword == "")  call msg_bug ("Rule key not set")
  select case (rule%type)
  case (S_UNKNOWN);  call bug (" Undefined rule")
  case (S_IGNORE, S_LOGICAL, S_INTEGER, S_REAL, S_COMPLEX, &
        S_IDENTIFIER, S_KEYWORD)
  case (S_QUOTED)
    if (rule%delimiter_left == "" .or. rule%delimiter_right == "") &
        call bug (" Missing quote character(s)")
  case (S_SEQUENCE)
  case (S_GROUP)

```

```

        if (rule%delimiter_left == "" .or. rule%delimiter_right == "") &
            call bug (" Missing delimiter(s)")
    case (S_LIST)
        if (rule%separator == "") call bug (" Missing separator")
    case (S_ARGS)
        if (rule%delimiter_left == "" .or. rule%delimiter_right == "") &
            call bug (" Missing delimiter(s)")
        if (rule%separator == "") call bug (" Missing separator")
    case (S_ALTERNATIVE)
    case default
        call bug (" Undefined syntax code")
    end select
    select case (rule%type)
    case (S_SEQUENCE, S_GROUP, S_LIST, S_ARGS, S_ALTERNATIVE)
        if (allocated (rule%child)) then
            if (.not.all (rule_is_associated (rule%child))) &
                call bug (" Child rules not all associated")
        else
            call bug (" Parent rule without children")
        end if
    case default
        if (allocated (rule%child)) call bug (" Non-parent rule with children")
    end select
contains
    subroutine bug (string)
        character(*), intent(in) :: string
        call msg_bug (" Syntax table: Rule " // char (rule%keyword) // ":" //
                      // string)
    end subroutine bug
end subroutine syntax_rule_check

```

### 7.3.4 Accessing rules

This is the API for syntax rules:

```

⟨Syntax: public⟩+≡
    public :: syntax_rule_get_type

⟨Syntax: subroutines⟩+≡
    function syntax_rule_get_type (rule) result (type)
        integer :: type
        type(syntax_rule_t), intent(in) :: rule
        type = rule%type
    end function syntax_rule_get_type

⟨Syntax: public⟩+≡
    public :: syntax_rule_get_key

⟨Syntax: syntax rule: TBP⟩+≡
    procedure :: get_key => syntax_rule_get_key

⟨Syntax: subroutines⟩+≡
    function syntax_rule_get_key (rule) result (key)
        class(syntax_rule_t), intent(in) :: rule
        type(string_t) :: key

```

```

    key = rule%keyword
end function syntax_rule_get_key

⟨Syntax: public⟩+≡
public :: syntax_rule_get_separator
public :: syntax_rule_get_delimiter

⟨Syntax: subroutines⟩+≡
function syntax_rule_get_separator (rule) result (separator)
    type(string_t) :: separator
    type(syntax_rule_t), intent(in) :: rule
    separator = rule%separator
end function syntax_rule_get_separator

function syntax_rule_get_delimiter (rule) result (delimiter)
    type(string_t), dimension(2) :: delimiter
    type(syntax_rule_t), intent(in) :: rule
    delimiter = [rule%delimiter_left, rule%delimiter_right]
end function syntax_rule_get_delimiter

```

Accessing child rules. If we use `syntax_rule_get_n_sub` for determining loop bounds, we do not need a check in the second routine.

```

⟨Syntax: public⟩+≡
public :: syntax_rule_get_n_sub
public :: syntax_rule_get_sub_ptr

⟨Syntax: subroutines⟩+≡
function syntax_rule_get_n_sub (rule) result (n)
    integer :: n
    type(syntax_rule_t), intent(in) :: rule
    if (allocated (rule%child)) then
        n = size (rule%child)
    else
        n = 0
    end if
end function syntax_rule_get_n_sub

function syntax_rule_get_sub_ptr (rule, i) result (sub)
    type(syntax_rule_t), pointer :: sub
    type(syntax_rule_t), intent(in), target :: rule
    integer, intent(in) :: i
    sub => rule%child(i)%p
end function syntax_rule_get_sub_ptr

subroutine syntax_rule_set_sub (rule, i, sub)
    type(syntax_rule_t), intent(inout) :: rule
    integer, intent(in) :: i
    type(syntax_rule_t), intent(in), target :: sub
    rule%child(i)%p => sub
end subroutine syntax_rule_set_sub

```

Return the modifier flags:

⟨Syntax: public⟩+≡

```

public :: syntax_rule_last_optional
public :: syntax_rule_last_repetitive

⟨Syntax: subroutines⟩+≡
    function syntax_rule_last_optional (rule) result (opt)
        logical :: opt
        type(syntax_rule_t), intent(in) :: rule
        opt = rule%opt
    end function syntax_rule_last_optional
    function syntax_rule_last_repetitive (rule) result (rep)
        logical :: rep
        type(syntax_rule_t), intent(in) :: rule
        rep = rule%rep
    end function syntax_rule_last_repetitive

```

Return true if the rule is atomic, i.e., logical, real, keyword etc.

```

⟨Syntax: public⟩+≡
    public :: syntax_rule_is_atomic

⟨Syntax: subroutines⟩+≡
    function syntax_rule_is_atomic (rule) result (atomic)
        logical :: atomic
        type(syntax_rule_t), intent(in) :: rule
        select case (rule%type)
        case (S_LOGICAL, S_INTEGER, S_REAL, S_COMPLEX, S_IDENTIFIER, &
              S_KEYWORD, S_QUOTED)
            atomic = .true.
        case default
            atomic = .false.
        end select
    end function syntax_rule_is_atomic

```

### 7.3.5 Syntax tables

A syntax table contains the tree of syntax rules and, for direct parser access, the list of valid keywords.

#### Types

The syntax contains an array of rules and a list of keywords. The array is actually used as a tree, where the top rule is the first array element, and the other rules are recursively pointed to by this first rule. (No rule should be used twice or be unused.) The keyword list is derived from the rule tree.

Objects of this type need the target attribute if they are associated with a lexer. The keyword list will be pointed to by this lexer.

```

⟨Syntax: public⟩+≡
    public :: syntax_t

⟨Syntax: types⟩+≡
    type :: syntax_t
        private
        type(syntax_rule_t), dimension(:), allocatable :: rule
        type(keyword_list_t) :: keyword_list

```

```
end type syntax_t
```

### Constructor/destructor

Initialize and finalize syntax tables

```
(Syntax: public)+≡
  public :: syntax_init
  public :: syntax_final
```

There are two ways to create a syntax: hard-coded from rules or dynamically from file.

```
(Syntax: interfaces)≡
  interface syntax_init
    module procedure syntax_init_from_ifile
  end interface
```

The syntax definition is read from an `ifile` object which contains the syntax definitions in textual form, one rule per line. This interface allows for determining the number of rules beforehand.

To parse the rule definitions, we make up a temporary lexer. Obviously, we cannot use a generic parser yet, so we have to hardcode the parsing process.

```
(Syntax: subroutines)+≡
  subroutine syntax_init_from_ifile (syntax, ifile)
    type(syntax_t), intent(out), target :: syntax
    type(ifile_t), intent(in) :: ifile
    type(lexer_t) :: lexer
    type(line_p) :: line
    type(string_t) :: string
    integer :: n_token
    integer :: i
    call lexer_init (lexer, &
      comment_chars = "", &
      quote_chars = "<'\"\"", &
      quote_match = ">'\"\"", &
      single_chars = "?*+|=,(())", &
      special_class = ["."], &
      keyword_list = null ())
    allocate (syntax%rule (ifile_get_length (ifile)))
    call line_init (line, ifile)
    do i = 1, size (syntax%rule)
      string = line_get_string_advance (line)
      call set_rule_type_and_key (syntax%rule(i), string, lexer)
    end do
    call line_init (line, ifile)
    do i = 1, size (syntax%rule)
      string = line_get_string_advance (line)
      select case (syntax%rule(i)%type)
        case (S_QUOTED, S_SEQUENCE, S_GROUP, S_LIST, S_ARGS, S_ALTERNATIVE)
          n_token = get_n_token (string, lexer)
          call set_rule_contents &
            (syntax%rule(i), syntax, n_token, string, lexer)
      end select
    end do
```

```

    end do
    call line_final (line)
    call lexer_final (lexer)
    call syntax_make_keyword_list (syntax)
    if (.not. all (syntax%rule%used)) then
        do i = 1, size (syntax%rule)
            if (.not. syntax%rule(i)%used) then
                call syntax_rule_write (syntax%rule(i), 6)
            end if
        end do
        call msg_bug (" Syntax table: unused rules")
    end if
end subroutine syntax_init_from_ifile

```

For a given rule defined in the input, the first task is to determine its type and key. With these, we can initialize the rule in the table, postponing the association of children.

```

<Syntax: subroutines>+≡
subroutine set_rule_type_and_key (rule, string, lexer)
    type(syntax_rule_t), intent(inout) :: rule
    type(string_t), intent(in) :: string
    type(lexer_t), intent(inout) :: lexer
    type(stream_t), target :: stream
    type(lexeme_t) :: lexeme
    type(string_t) :: key
    character(2) :: type
    call lexer_clear (lexer)
    call stream_init (stream, string)
    call lexer_assign_stream (lexer, stream)
    call lex (lexeme, lexer)
    type = lexeme_get_string (lexeme)
    call lex (lexeme, lexer)
    key = lexeme_get_contents (lexeme)
    call stream_final (stream)
    if (trim (key) /= "") then
        select case (type)
        case ("IG"); call syntax_rule_init (rule, key, S_IGNORE)
        case ("LO"); call syntax_rule_init (rule, key, S_LOGICAL)
        case ("IN"); call syntax_rule_init (rule, key, S_INTEGER)
        case ("RE"); call syntax_rule_init (rule, key, S_REAL)
        case ("CO"); call syntax_rule_init (rule, key, S_COMPLEX)
        case ("ID"); call syntax_rule_init (rule, key, S_IDENTIFIER)
        case ("KE"); call syntax_rule_init (rule, key, S_KEYWORD)
        case ("QU"); call syntax_rule_init (rule, key, S_QUOTED)
        case ("SE"); call syntax_rule_init (rule, key, S_SEQUENCE)
        case ("GR"); call syntax_rule_init (rule, key, S_GROUP)
        case ("LI"); call syntax_rule_init (rule, key, S_LIST)
        case ("AR"); call syntax_rule_init (rule, key, S_ARGS)
        case ("AL"); call syntax_rule_init (rule, key, S_ALTERNATIVE)
        case default
            call lexer_show_location (lexer)
            call msg_bug (" Syntax definition: unknown type '" // type // "'")
        end select
    end if
end subroutine set_rule_type_and_key

```

```

    else
        print *, char (string)
        call msg_bug (" Syntax definition: empty rule key")
    end if
end subroutine set_rule_type_and_key

```

This function returns the number of tokens in an input line.

```

<Syntax: subroutines>+≡
function get_n_token (string, lexer) result (n)

end function get_n_token

```

This subroutine extracts the rule contents for an input line. There are three tasks: (1) determine the number of children, depending on the rule type; (2) find and set the separator and delimiter strings, if required; (3) scan the child rules, find them in the syntax table and associate the parent rule with them.

```

```

This routine completes the syntax table object. We assume that the rule array is set up. We associate the top rule with the first entry in the rule array and build up the keyword list.

The keyword list includes delimiters and separators. Filling it can only be done after all rules are set. We scan the rule tree. For each keyword that we find, we try to add it to the keyword list; the pointer to the last element is carried along with the recursive scanning. Before appending a keyword, we check whether it is already in the list.

*(Syntax: subroutines)*+≡

```

subroutine syntax_make_keyword_list (syntax)
    type(syntax_t), intent(inout), target :: syntax

```

```

type(syntax_rule_t), pointer :: rule

                return
            end if
        end do
        call msg_bug (" Syntax table: Rule " // char (key) // " not found")
    end function syntax_get_rule_ptr

```

Return a pointer to the keyword list

```

⟨Syntax: public⟩+≡
    public :: syntax_get_keyword_list_ptr

⟨Syntax: subroutines⟩+≡
    function syntax_get_keyword_list_ptr (syntax) result (keyword_list)
        type(keyword_list_t), pointer :: keyword_list
        type(syntax_t), intent(in), target :: syntax
        keyword_list => syntax%keyword_list
    end function syntax_get_keyword_list_ptr

```

### 7.3.7 I/O

Write a readable representation of the syntax table

```

⟨Syntax: public⟩+≡
    public :: syntax_write

```

```

<Syntax: subroutines>+≡
    subroutine syntax_write (syntax, unit)
        type(syntax_t), intent(in) :: syntax
        integer, intent(in), optional :: unit
        integer :: u
        integer :: i
        u = given_output_unit (unit);  if (u < 0)  return
        write (u, "(A)") "Syntax table:"
        if (allocated (syntax%rule)) then
            do i = 1, size (syntax%rule)
                call syntax_rule_write (syntax%rule(i), u)
            end do
        else
            write (u, "(1x,A)") "[not allocated]"
        end if
        call keyword_list_write (syntax%keyword_list, u)
    end subroutine syntax_write

```

## 7.4 The parser

On a small scale, the parser interprets the string tokens returned by the lexer; they are interpreted as numbers, keywords and such and stored as a typed object. On a large scale, a text is read, parsed, and a syntax rule set is applied such that the tokens are stored as a parse tree. Syntax errors are spotted in this process, so the resulting parse tree is syntactically correct by definition.

```
⟨parser.f90⟩≡
  ⟨File header⟩

  module parser

    ⟨Use kinds⟩
    ⟨Use strings⟩
    use io_units
    use format_defs, only: FMT_19
    use system_defs, only: DIGITS
    use diagnostics
    use md5
    use lexers
    use syntax_rules

    ⟨Standard module head⟩

    ⟨Parser: public⟩

    ⟨Parser: types⟩

    ⟨Parser: interfaces⟩

    contains

    ⟨Parser: procedures⟩

  end module parser
```

### 7.4.1 The token type

Tokens are elements of the parsed input that carry a value: logical, integer, real, quoted string, (unquoted) identifier, or known keyword. Note that non-keyword tokens also have an abstract key attached to them.

This is an obvious candidate for polymorphism.

```
⟨Parser: types⟩≡
  type :: token_t
  private
    integer :: type = S_UNKNOWN
    logical, pointer :: lval => null ()
    integer, pointer :: ival => null ()
    real(default), pointer :: rval => null ()
    complex(default), pointer :: cval => null ()
    type(string_t), pointer :: sval => null ()
    type(string_t), pointer :: kval => null ()
```

```

    type(string_t), dimension(:), pointer :: quote => null ()
end type token_t

```

Create a token from the lexeme returned by the lexer: Allocate storage and try to interpret the lexeme according to the type that is requested by the parser. For a keyword token, match the lexeme against the requested key. If successful, set the token type, value, and key. Otherwise, set the type to S\_UNKNOWN.

*(Parser: procedures)≡*

```

subroutine token_init (token, lexeme, requested_type, key)
    type(token_t), intent(out) :: token
    type(lexeme_t), intent(in) :: lexeme
    integer, intent(in) :: requested_type

        allocate (token%lval)
        token%lval = lval
    end subroutine token_assign_logical

    subroutine token_assign_string (token, sval)
        type(token_t), intent(out) :: token
        type(string_t), intent(in) :: sval
        token%type = S_QUOTED
        allocate (token%sval)
        token%sval = sval
        allocate (token%quote(2)); token%quote = ''
    end subroutine token_assign_string

```

#### 7.4.2 Retrieve token contents

These functions all do a trivial sanity check that should avoid crashes.

```

⟨Parser: procedures⟩+≡
    function token_get_logical (token) result (lval)
        logical :: lval
        type(token_t), intent(in) :: token
        if (associated (token%lval)) then
            lval = token%lval
        else

```

```

        call token_mismatch (token, "logical")
    end if
end function token_get_logical

function token_get_integer (token) result (ival)
    integer :: ival
    type(token_t), intent(in) :: token
    if (associated (token%ival)) then
        ival = token%ival
    else
        call token_mismatch (token, "integer")
    end if
end function token_get_integer

function token_get_real (token) result (rval)
    real(default) :: rval
    type(token_t), intent(in) :: token
    if (associated (token%rval)) then
        rval = token%rval
    else
        call token_mismatch (token, "real")
    end if
end function token_get_real

function token_get_cmplx (token) result (cval)
    complex(default) :: cval
    type(token_t), intent(in) :: token
    if (associated (token%cval)) then
        cval = token%cval
    else
        call token_mismatch (token, "complex")
    end if
end function token_get_cmplx

function token_get_string (token) result (sval)
    type(string_t) :: sval
    type(token_t), intent(in) :: token
    if (associated (token%sval)) then
        sval = token%sval
    else
        call token_mismatch (token, "string")
    end if
end function token_get_string

function token_get_key (token) result (kval)
    type(string_t) :: kval
    type(token_t), intent(in) :: token
    if (associated (token%kval)) then
        kval = token%kval
    else
        call token_mismatch (token, "keyword")
    end if
end function token_get_key

```

```

function token_get_quote (token) result (quote)
    type(string_t), dimension(2) :: quote
    type(token_t), intent(in) :: token
    if (associated (token%quote)) then
        quote = token%quote
    else
        call token_mismatch (token, "quote")
    end if
end function token_get_quote

<Parser: procedures>+≡
subroutine token_mismatch (token, type)
    type(token_t), intent(in) :: token
    character(*), intent(in) :: type
    write (6, "(A)", advance="no")  "Token: "
    call token_write (token)
    call msg_bug (" Token type mismatch; value required as " // type)
end subroutine token_mismatch

```

#### 7.4.3 The parse tree: nodes

The parser will generate a parse tree from the input stream. Each node in this parse tree points to the syntax rule that was applied. (Since syntax rules are stored in a pointer-type array within the syntax table, they qualify as targets.) A leaf node contains a token. A branch node has subnodes. The subnodes are stored as a list, so each node also has a `next` pointer.

```

<Parser: public>≡
public :: parse_node_t

<Parser: types>+≡
type :: parse_node_t
    private
    type(syntax_rule_t), pointer :: rule => null ()
    type(token_t) :: token
    integer :: n_sub = 0
    type(parse_node_t), pointer :: sub_first => null ()
    type(parse_node_t), pointer :: sub_last => null ()
    type(parse_node_t), pointer :: next => null ()
contains
    <Parser: parse node: TBP>
end type parse_node_t

```

Container for parse node pointers, useful for creating pointer arrays:

```

<Parser: public>+≡
public :: parse_node_p

<Parser: types>+≡
type :: parse_node_p
    type(parse_node_t), pointer :: ptr => null ()
end type parse_node_p

```

Output. The first version writes a node together with its sub-node tree, organized by indentation.

```

⟨Parser: parse node: TBP⟩≡
procedure :: write => parse_node_write_rec
⟨Parser: public⟩+≡
public :: parse_node_write_rec
⟨Parser: procedures⟩+≡
recursive subroutine parse_node_write_rec (node, unit, short, depth)
  class(parse_node_t), intent(in), target :: node
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: short
  integer, intent(in), optional :: depth
  integer :: u, d
  type(parse_node_t), pointer :: current
  u = given_output_unit (unit);  if (u < 0)  return
  d = 0;  if (present (depth))  d = depth
  call parse_node_write (node, u, short=short)
  current => node%sub_first
  do while (associated (current))
    write (u, "(A)", advance = "no")  repeat ("| ", d)
    call parse_node_write_rec (current, unit, short, d+1)
    current => current%next
  end do
end subroutine parse_node_write_rec

```

This does the actual output for a single node, without recursion.

```

⟨Parser: public⟩+≡
public :: parse_node_write
⟨Parser: procedures⟩+≡
subroutine parse_node_write (node, unit, short)
  class(parse_node_t), intent(in) :: node
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: short
  integer :: u
  type(parse_node_t), pointer :: current
  u = given_output_unit (unit);  if (u < 0)  return
  write (u, "(+'')", advance = "no")
  if (associated (node%rule)) then
    call syntax_rule_write (node%rule, u, &
                           short=short, key_only=.true., advance=.false.)
  if (token_is_valid (node%token)) then
    write (u, "(' = ')", advance="no")
    call token_write (node%token, u)
  else if (associated (node%sub_first)) then
    write (u, "(' = ')", advance="no")
    current => node%sub_first
    do while (associated (current))
      call syntax_rule_write (current%rule, u, &
                             short=.true., key_only=.true., advance=.false.)
      current => current%next
    end do
    write (u, *)

```

```

        else
            write (u, *)
        end if
    else
        write (u, *) "[empty]"
    end if
end subroutine parse_node_write

```

Finalize the token and recursively finalize and deallocate all sub-nodes.

```

<Parser: public>+≡
public :: parse_node_final

<Parser: procedures>+≡
recursive subroutine parse_node_final (node, recursive)
    type(parse_node_t), intent(inout) :: node
    type(parse_node_t), pointer :: current
    logical, intent(in), optional :: recursive
    logical :: rec
    rec = .true.; if (present (recursive)) rec = recursive
    call token_final (node%token)
    if (rec) then
        do while (associated (node%sub_first))
            current => node%sub_first
            node%sub_first => node%sub_first%next
            call parse_node_final (current)
            deallocate (current)
        end do
    end if
end subroutine parse_node_final

```

#### 7.4.4 Filling nodes

The constructors allocate and initialize the node. There are two possible initializers (in a later version, should correspond to different type extensions).

First, leaf (terminal) nodes. The token constructor does the actual work, looking at the requested type and key for the given rule and matching against the lexeme contents. If it fails, the token will keep the type S\_UNKNOWN and remain empty. Otherwise, we have a valid node which contains the new token.

If the lexeme argument is absent, the token is left empty.

```

<Parser: procedures>+≡
subroutine parse_node_create_leaf (node, rule, lexeme)
    type(parse_node_t), pointer :: node
    type(syntax_rule_t), intent(in), target :: rule
    type(lexeme_t), intent(in) :: lexeme
    allocate (node)
    node%rule => rule
    call token_init (node%token, lexeme, &
                    syntax_rule_get_type (rule), syntax_rule_get_key (rule))
    if (.not. token_is_valid (node%token)) deallocate (node)
end subroutine parse_node_create_leaf

```

This version allows us to manually create a leaf node that holds a keyword.

```
<Parser: public>+≡
    public :: parse_node_create_key
<Parser: procedures>+≡
    subroutine parse_node_create_key (node, rule)
        type(parse_node_t), intent(out) :: node
        type(syntax_rule_t), intent(in), target :: rule
        node%rule => rule
        call token_init_key (node%token, syntax_rule_get_key (rule))
    end subroutine parse_node_create_key
```

This version allows us to manually create a leaf node that holds a fixed value.  
Only one of the optional values should be provided.

```
<Parser: public>+≡
    public :: parse_node_create_value
<Parser: procedures>+≡
    subroutine parse_node_create_value (node, rule, ival, rval, cval, sval, lval)
        type(parse_node_t), intent(out) :: node
        type(syntax_rule_t), intent(in), target :: rule
        integer, intent(in), optional :: ival
        real(default), intent(in), optional :: rval
        complex(default), intent(in), optional :: cval
        type(string_t), intent(in), optional :: sval
        logical, intent(in), optional :: lval
        node%rule => rule
        call parse_node_set_value (node, ival, rval, cval, sval, lval)
    end subroutine parse_node_create_value
```

Directly set the value without changing anything else.

```
<Parser: public>+≡
    public :: parse_node_set_value
<Parser: procedures>+≡
    subroutine parse_node_set_value (node, ival, rval, cval, sval, lval)
        type(parse_node_t), intent(inout) :: node
        integer, intent(in), optional :: ival
        real(default), intent(in), optional :: rval
        complex(default), intent(in), optional :: cval
        type(string_t), intent(in), optional :: sval
        logical, intent(in), optional :: lval
        if (present (ival)) then
            node%token = ival
        else if (present (rval)) then
            node%token = rval
        else if (present (cval)) then
            node%token = cval
        else if (present (lval)) then
            node%token = lval
        else if (present (sval)) then
            node%token = sval
        end if
    end subroutine parse_node_set_value
```

Second, branch nodes. We first assign the rule:

```
<Parser: public>+≡
    public :: parse_node_create_branch
<Parser: procedures>+≡
    subroutine parse_node_create_branch (node, rule)
        type(parse_node_t), pointer :: node
        type(syntax_rule_t), intent(in), target :: rule
        allocate (node)
        node%rule => rule
    end subroutine parse_node_create_branch
```

Copy a node. This is a shallow copy. Note that we have to nullify the `next` pointer if we don't want to inherit the context of the original node.

```
<Parser: parse node: TBP>+≡
    procedure :: copy => parse_node_copy
<Parser: procedures>+≡
    subroutine parse_node_copy (node, copy)
        class(parse_node_t), intent(in) :: node
        type(parse_node_t), pointer, intent(out) :: copy
        allocate (copy)
        select type (node)
        type is (parse_node_t)
            copy = node
        end select
        copy%next => null ()
    end subroutine parse_node_copy
```

Append a sub-node. The sub-node must exist and be a valid target, otherwise nothing is done.

```
<Parser: public>+≡
    public :: parse_node_append_sub
<Parser: parse node: TBP>+≡
    procedure :: append_sub => parse_node_append_sub
<Parser: procedures>+≡
    subroutine parse_node_append_sub (node, sub)
        class(parse_node_t), intent(inout) :: node
        type(parse_node_t), pointer :: sub
        if (associated (sub)) then
            if (associated (node%sub_last)) then
                node%sub_last%next => sub
            else
                node%sub_first => sub
            end if
            node%sub_last => sub
        end if
    end subroutine parse_node_append_sub
```

For easy access, once the list is complete we count the number of sub-nodes. If there are no subnodes, the whole node is deleted.

```
<Parser: public>+≡
    public :: parse_node_freeze_branch
```

```

⟨Parser: procedures⟩+≡
    subroutine parse_node_freeze_branch (node)
        type(parse_node_t), pointer :: node
        type(parse_node_t), pointer :: current
        node%n_sub = 0
        current => node%sub_first
        do while (associated (current))
            node%n_sub = node%n_sub + 1
            current => current%next
        end do
        if (node%n_sub == 0)  deallocate (node)
    end subroutine parse_node_freeze_branch

```

Replace the syntax rule. This makes sense only if the parse node adheres to the syntax of the new rule.

```

⟨Parser: public⟩+≡
    public :: parse_node_replace_rule
⟨Parser: procedures⟩+≡
    subroutine parse_node_replace_rule (node, rule)
        type(parse_node_t), pointer :: node
        type(syntax_rule_t), intent(in), target :: rule
        node%rule => rule
    end subroutine parse_node_replace_rule

```

Replace the last subnode by the target node. Since the subnodes are stored as a linked list, we can do this only if we copy the subnodes. Furthermore, the target node must also be copied, and the `next` pointer of the copy is nullified. This ensures that we cannot modify the originals at the subnode level.

All copies are shallow copies. This implies that further modifications at the sub-subnode level will affect the original nodes and must therefore be forbidden.

Use with care, this invites to memory mismanagement. The copy nodes can be deallocated, but not finalized, since its subnodes are the same objects as the subnodes of the target node.

```

⟨Parser: public⟩+≡
    public :: parse_node_replace_last_sub
⟨Parser: procedures⟩+≡
    subroutine parse_node_replace_last_sub (node, pn_target)
        type(parse_node_t), intent(inout), target :: node
        type(parse_node_t), intent(in), target :: pn_target
        type(parse_node_t), pointer :: current, current_copy, previous
        integer :: i
        select case (node%n_sub)
        case (1)
            allocate (current_copy)
            current_copy = pn_target
            node%sub_first => current_copy
        case (2:)
            current => node%sub_first
            allocate (current_copy)
            current_copy = current
            node%sub_first => current_copy
        end select
    end subroutine parse_node_replace_last_sub

```

```

previous => current_copy
do i = 1, node%n_sub - 2
    current => current%next
    allocate (current_copy)
    current_copy = current
    previous%next => current_copy
    previous => current_copy
end do
allocate (current_copy)
current_copy = pn_target
previous%next => current_copy
case default
    call parse_node_write (node)
    call msg_bug ("'replace_last_sub' called for non-branch parse node")
end select
current_copy%next => null ()
node%sub_last => current_copy
end subroutine parse_node_replace_last_sub

```

#### 7.4.5 Accessing nodes

Return the node contents. Check if pointers are associated. No check when accessing a sub-node; assume that `parse_node_n_sub` is always used for the upper bound.

The token extractor returns a pointer.

```

⟨Parser: public⟩+≡
public :: parse_node_get_rule_ptr
public :: parse_node_get_n_sub
public :: parse_node_get_sub_ptr
public :: parse_node_get_next_ptr
public :: parse_node_get_last_sub_ptr

⟨Parser: parse node: TBP⟩+≡
procedure :: get_rule_ptr => parse_node_get_rule_ptr
procedure :: get_n_sub => parse_node_get_n_sub
procedure :: get_sub_ptr => parse_node_get_sub_ptr
procedure :: get_next_ptr => parse_node_get_next_ptr

⟨Parser: procedures⟩+≡
function parse_node_get_rule_ptr (node) result (rule)
    class(parse_node_t), intent(in) :: node
    type(syntax_rule_t), pointer :: rule
    if (associated (node%rule)) then
        rule => node%rule
    else
        rule => null ()
        call parse_node_undefined (node, "rule")
    end if
end function parse_node_get_rule_ptr

function parse_node_get_n_sub (node) result (n)
    class(parse_node_t), intent(in) :: node
    integer :: n

```

```

n = node%n_sub
end function parse_node_get_n_sub

function parse_node_get_sub_ptr (node, n, tag, required) result (sub)
  class(parse_node_t), intent(in), target :: node
  type(parse_node_t), pointer :: sub
  integer, intent(in), optional :: n
  character(*), intent(in), optional :: tag
  logical, intent(in), optional :: required
  integer :: i
  sub => node%sub_first
  if (present (n)) then
    do i = 2, n
      if (associated (sub)) then
        sub => sub%next
      else
        return
      end if
    end do
  end if
  call parse_node_check (sub, tag, required)
end function parse_node_get_sub_ptr

function parse_node_get_next_ptr (sub, n, tag, required) result (next)
  class(parse_node_t), intent(in), target :: sub
  type(parse_node_t), pointer :: next
  integer, intent(in), optional :: n
  character(*), intent(in), optional :: tag
  logical, intent(in), optional :: required
  integer :: i
  next => sub%next
  if (present (n)) then
    do i = 2, n
      if (associated (next)) then
        next => next%next
      else
        exit
      end if
    end do
  end if
  call parse_node_check (next, tag, required)
end function parse_node_get_next_ptr

function parse_node_get_last_sub_ptr (node, tag, required) result (sub)
  type(parse_node_t), pointer :: sub
  type(parse_node_t), intent(in), target :: node
  character(*), intent(in), optional :: tag
  logical, intent(in), optional :: required
  sub => node%sub_last
  call parse_node_check (sub, tag, required)
end function parse_node_get_last_sub_ptr

```

*(Parser: procedures)*+≡  
 subroutine parse\_node\_undefined (node, obj)

```

type(parse_node_t), intent(in) :: node
character(*), intent(in) :: obj
call parse_node_write (node, 6)
call msg_bug (" Parse-tree node: " // obj // " requested, but undefined")
end subroutine parse_node_undefined

```

Check if a parse node has a particular tag, and if it is associated:

```

<Parser: public>+≡
    public :: parse_node_check

<Parser: procedures>+≡
    subroutine parse_node_check (node, tag, required)
        type(parse_node_t), pointer :: node
        character(*), intent(in), optional :: tag
        logical, intent(in), optional :: required
        if (associated (node)) then
            if (present (tag)) then
                if (parse_node_get_rule_key (node) /= tag) &
                    call parse_node_mismatch (tag, node)
            end if
        else
            if (present (required)) then
                if (required) &
                    call msg_bug (" Missing node, expected <" // tag // ">")
            end if
        end if
    end subroutine parse_node_check

```

This is called by a parse-tree scanner if the expected and the actual nodes do not match

```

<Parser: public>+≡
    public :: parse_node_mismatch

<Parser: procedures>+≡
    subroutine parse_node_mismatch (string, parse_node)
        character(*), intent(in) :: string
        type(parse_node_t), intent(in) :: parse_node
        call parse_node_write (parse_node)
        call msg_bug (" Syntax mismatch, expected <" // string // ">.")
    end subroutine parse_node_mismatch

```

The following functions are wrappers for extracting the token contents.

```

<Parser: public>+≡
    public :: parse_node_get_logical
    public :: parse_node_get_integer
    public :: parse_node_get_real
    public :: parse_node_get_cmplx
    public :: parse_node_get_string
    public :: parse_node_get_key
    public :: parse_node_get_rule_key

<Parser: parse node: TBP>+≡
    procedure :: get_logical => parse_node_get_logical

```

```

procedure :: get_integer => parse_node_get_integer
procedure :: get_real => parse_node_get_real
procedure :: get_cmplx => parse_node_get_cmplx
procedure :: get_string => parse_node_get_string
procedure :: get_key => parse_node_get_key
procedure :: get_rule_key => parse_node_get_rule_key

<Parser: procedures>+≡
function parse_node_get_logical (node) result (lval)
  class(parse_node_t), intent(in), target :: node
  logical :: lval
  lval = token_get_logical (parse_node_get_token_ptr (node))
end function parse_node_get_logical

function parse_node_get_integer (node) result (ival)
  class(parse_node_t), intent(in), target :: node
  integer :: ival
  ival = token_get_integer (parse_node_get_token_ptr (node))
end function parse_node_get_integer

function parse_node_get_real (node) result (rval)
  class(parse_node_t), intent(in), target :: node
  real(default) :: rval
  rval = token_get_real (parse_node_get_token_ptr (node))
end function parse_node_get_real

function parse_node_get_cmplx (node) result (cval)
  class(parse_node_t), intent(in), target :: node
  complex(default) :: cval
  cval = token_get_cmplx (parse_node_get_token_ptr (node))
end function parse_node_get_cmplx

function parse_node_get_string (node) result (sval)

#### 7.4.6 The parse tree

The parse tree is a tree of nodes, where leaf nodes hold a valid token, while branch nodes point to a list of sub-nodes.

```

⟨Parser: public⟩+≡
public :: parse_tree_t

⟨Parser: types⟩+≡
type :: parse_tree_t
    private
    type(parse_node_t), pointer :: root_node => null ()
contains
    ⟨Parser: parse tree: TBP⟩
end type parse_tree_t

```

The parser. Its arguments are the parse tree (which should be empty initially), the lexer (which should be already set up), the syntax table (which should be valid), and the input stream. The input stream is completely parsed, using the lexer setup and the syntax rules as given, and the parse tree is built accordingly.

If `check_eof` is absent or true, the parser will complain about trailing garbage. Otherwise, it will ignore it.

By default, the input stream is matched against the top rule in the specified syntax. If `key` is given, it is matched against the rule with the specified key instead.

Failure at the top level means that no rule could match at all; in this case the error message will show the top rule.

```

⟨Parser: public⟩+≡
public :: parse_tree_init

```

```

⟨Parser: parse tree: TBP⟩≡
procedure :: parse => parse_tree_init

        call lexer_put_back (lexer, lexeme)
        ok = .false.
    end if
end subroutine parse_args

```

The IGNORE syntax reads one lexeme and discards it if it is numeric, logical or string/identifier (but not a keyword). This is a successful match. Otherwise, the match fails. The node pointer is returned disassociated in any case.

```

<Parser: internal subroutines of parse_tree_init>+≡
subroutine parse_ignore (node, ok)
    type(parse_node_t), pointer :: node
    logical, intent(out) :: ok
    call lex (lexeme, lexer)
    select case (lexeme_get_type (lexeme))
    case (T_NUMERIC, T_IDENTIFIER, T_QUOTED)
        ok = .true.
    case default
        ok = .false.
    end select
    node => null ()
end subroutine parse_ignore

```

If the match fails and we cannot step back:

```

<Parser: internal subroutines of parse_tree_init>+≡
subroutine parse_error (rule, lexeme)
    type(syntax_rule_t), intent(in) :: rule
    type(lexeme_t), intent(in) :: lexeme
    character(80) :: buffer
    integer :: u, iostat
    call lexer_show_location (lexer)
    u = free_unit ()
    open (u, status = "scratch")
    write (u, "(A)", advance="no")  "Expected syntax:"
    call syntax_rule_write (rule, u)
    write (u, "(A)", advance="no")  "Found token:"
    call lexeme_write (lexeme, u)
    rewind (u)
    do
        read (u, "(A)", iostat=iostat) buffer
        if (iostat /= 0) exit
        call msg_message (trim (buffer))
    end do
    call msg_fatal (" Syntax error " &
                   // "(at or before the location indicated above)")
end subroutine parse_error

```

The finalizer recursively deallocates all nodes and their contents. For each node, `parse_node_final` is called on the sub-nodes, which in turn deallocates the token or sub-node array contained within each of them. At the end, only the top node remains to be deallocated.

```

<Parser: public>+≡
public :: parse_tree_final
<Parser: parse tree: TBP>+≡
procedure :: final => parse_tree_final

```

```

⟨Parser: procedures⟩+≡
    subroutine parse_tree_final (parse_tree)
        class(parse_tree_t), intent(inout) :: parse_tree
        if (associated (parse_tree%root_node)) then
            call parse_node_final (parse_tree%root_node)
            deallocate (parse_tree%root_node)
        end if
    end subroutine parse_tree_final

```

Print the parse tree. Print one token per line, indented according to the depth of the node.

The `verbose` version includes type identifiers for the nodes.

```

⟨Parser: public⟩+≡
    public :: parse_tree_write
⟨Parser: parse tree: TBP⟩+≡
    procedure :: write => parse_tree_write
⟨Parser: procedures⟩+≡
    subroutine parse_tree_write (parse_tree, unit, verbose)
        class(parse_tree_t), intent(in) :: parse_tree
        integer, intent(in), optional :: unit
        logical, intent(in), optional :: verbose
        integer :: u
        logical :: short
        u = given_output_unit (unit);  if (u < 0)  return
        short = .true.;  if (present (verbose))  short = .not. verbose
        write (u, "(A)" "Parse tree:")
        if (associated (parse_tree%root_node)) then
            call parse_node_write_rec (parse_tree%root_node, unit, short, 1)
        else
            write (u, *) "[empty]"
        end if
    end subroutine parse_tree_write

```

This is a generic error that can be issued if the parse tree does not meet the expectaions of the parser. This most certainly indicates a bug.

```

⟨Parser: public⟩+≡
    public :: parse_tree_bug
⟨Parser: procedures⟩+≡
    subroutine parse_tree_bug (node, keys)
        type(parse_node_t), intent(in) :: node
        character(*), intent(in) :: keys
        call parse_node_write (node)
        call msg_bug (" Inconsistency in parse tree: expected " // keys)
    end subroutine parse_tree_bug

```

#### 7.4.7 Access the parser

For scanning the parse tree we give access to the top node, as a node pointer. Of course, there should be no write access.

```

⟨Parser: parse tree: TBP⟩+≡

```

```

procedure :: get_root_ptr => parse_tree_get_root_ptr
⟨Parser: procedures⟩+≡
    function parse_tree_get_root_ptr (parse_tree) result (node)
        class(parse_tree_t), intent(in) :: parse_tree
        type(parse_node_t), pointer :: node
        node => parse_tree%root_node
    end function parse_tree_get_root_ptr

```

#### 7.4.8 Tools

This operation traverses the parse tree and simplifies any occurrences of a set of syntax rules. If such a parse node has only one sub-node, it is replaced by that subnode. (This makes sense only of the rules to eliminate have no meaningful token.)

```

⟨Parser: public⟩+≡
    public :: parse_tree_reduce
⟨Parser: procedures⟩+≡

## 7.5 XML Parser

The XML parser is actually independent from the previous modules of lexer and parser. However, for a generic I/O interface we make use of the `stream_t` facility.

We need the XML parser for reading and writing LHEF data files. Only a subset of XML is actually relevant. The parser is of the “pull” type, i.e., the program steers the reading of XML data in a context-sensitive manner.

```
(xml.f90)≡
  <File header>

  module xml

    <Use strings>
    use io_units
    use system_defs, only: BLANK, TAB
    use diagnostics
    use ifiles
    use lexers

    <Standard module head>

    <XML: public>

    <XML: types>

    contains

    <XML: procedures>

  end module xml
```

### 7.5.1 Cached Stream

The stream type as defined in the `lexer` module is versatile regarding the choice of input channel, but it does not allow reading a section more than once. Here, we define an extension where we can return a string to the stream, which is stored in a cache variable, and presented to the caller for the next read.

```
<XML: public>≡
  public :: cstream_t
<XML: types>≡
  type, extends (stream_t) :: cstream_t
    logical :: cache_is_empty = .true.
    type(string_t) :: cache
  contains
    <XML: cstream: TBP>
  end type cstream_t
```

The initializers are simply inherited.

Finalizer: also inherited, in essence:

```
<XML: cstream: TBP>≡
  procedure :: final => cstream_final
```

```

⟨XML: procedures⟩≡
    subroutine cstream_final (stream)
        class(cstream_t), intent(inout) :: stream
        stream%cache_is_empty = .true.
        call stream%stream_t%final ()
    end subroutine cstream_final

```

Get record: now, if there is a cache string, return this instead of the record from the stream.

```

⟨XML: cstream: TBP⟩+≡
    procedure :: get_record => cstream_get_record
⟨XML: procedures⟩+≡
    subroutine cstream_get_record (cstream, string, iostat)
        class(cstream_t), intent(inout) :: cstream
        type(string_t), intent(out) :: string
        integer, intent(out) :: iostat
        if (cstream%cache_is_empty) then
            call stream_get_record (cstream%stream_t, string, iostat)
        else
            string = cstream%cache
            cstream%cache_is_empty = .true.
            iostat = 0
        end if
    end subroutine cstream_get_record

```

Revert: return the (partially read) record to the stream, putting it in the cache.

```

⟨XML: cstream: TBP⟩+≡
    procedure :: revert_record => cstream_revert_record
⟨XML: procedures⟩+≡
    subroutine cstream_revert_record (cstream, string)
        class(cstream_t), intent(inout) :: cstream
        type(string_t), intent(in) :: string
        if (cstream%cache_is_empty) then
            cstream%cache = string
            cstream%cache_is_empty = .false.
        else
            call msg_bug ("CStream: attempt to revert twice")
        end if
    end subroutine cstream_revert_record

```

### 7.5.2 Attributes

A tag attribute has a name and a value; both are strings. When the attribute is defined, the known flag indicates this.

```

⟨XML: types⟩+≡
    type :: attribute_t
        type(string_t) :: name
        type(string_t) :: value
        logical :: known = .false.
        contains

```

```

<XML: attribute: TBP>
end type attribute_t

```

Output in standard format, non-advancing. (If the value is unknown, we indicate this by a question mark, which is non-standard.)

```

<XML: attribute: TBP>≡
procedure :: write => attribute_write
<XML: procedures>+≡
subroutine attribute_write (object, unit)
  class(attribute_t), intent(in) :: object
  integer, intent(in), optional :: unit
  integer :: u
  u = given_output_unit (unit)
  write (u, "(A,'=')", advance = "no")  char (object%name)
  if (object%known) then
    write (u, "(A,A,A)", advance = "no")  "", char (object%value), ""
  else
    write (u, ("'?"), advance = "no")
  end if
end subroutine attribute_write

```

This is a genuine constructor. The value is optional.

```

<XML: public>+≡
public :: xml_attribute
<XML: procedures>+≡
function xml_attribute (name, value) result (attribute)
  type(string_t), intent(in) :: name
  type(string_t), intent(in), optional :: value
  type(attribute_t) :: attribute
  attribute%name = name
  if (present (value)) then
    attribute%value = value
    attribute%known = .true.
  else
    attribute%known = .false.
  end if
end function xml_attribute

```

Set a value explicitly.

```

<XML: attribute: TBP>+≡
procedure :: set_value => attribute_set_value
<XML: procedures>+≡
subroutine attribute_set_value (attribute, value)
  class(attribute_t), intent(inout) :: attribute
  type(string_t), intent(in) :: value
  attribute%value = value
  attribute%known = .true.
end subroutine attribute_set_value

```

```

Extract a value. If unset, return "?"
<XML: attribute: TBP>+≡
    procedure :: get_value => attribute_get_value
<XML: procedures>+≡
    function attribute_get_value (attribute) result (value)
        class(attribute_t), intent(in) :: attribute
        type(string_t) :: value
        if (attribute%known) then
            value = attribute%value
        else
            value = "?"
        end if
    end function attribute_get_value

```

### 7.5.3 The Tag Type

The basic entity is the internal representation of an XML tag. The tag has a name, a well-defined set of attributes which may be mandatory or optional, and a flag that determines whether there is content or not. The content itself is not stored in the data structure.

```

<XML: public>+≡
    public :: xml_tag_t
<XML: types>+≡
    type :: xml_tag_t
        type(string_t) :: name
        type(attribute_t), dimension(:), allocatable :: attribute
        logical :: has_content = .false.
        contains
        <XML: tag: TBP>
    end type xml_tag_t

```

Initialization. There are different versions, depending on content.

```

<XML: tag: TBP>≡
    generic :: init => init_no_attributes
    procedure :: init_no_attributes => tag_init_no_attributes
<XML: procedures>+≡
    subroutine tag_init_no_attributes (tag, name, has_content)
        class(xml_tag_t), intent(out) :: tag
        type(string_t), intent(in) :: name
        logical, intent(in), optional :: has_content
        tag%name = name
        allocate (tag%attribute (0))
        if (present (has_content)) tag%has_content = has_content
    end subroutine tag_init_no_attributes

```

This version sets attributes.

```

<XML: tag: TBP>+≡
    generic :: init => init_with_attributes
    procedure :: init_with_attributes => tag_init_with_attributes

```

```

⟨XML: procedures⟩+≡
    subroutine tag_init_with_attributes (tag, name, attribute, has_content)
        class(xml_tag_t), intent(out) :: tag
        type(string_t), intent(in) :: name
        type(attribute_t), dimension(:), intent(in) :: attribute
        logical, intent(in), optional :: has_content
        tag%name = name
        allocate (tag%attribute (size (attribute)))
        tag%attribute = attribute
        if (present (has_content)) tag%has_content = has_content
    end subroutine tag_init_with_attributes

```

Set an attribute value explicitly.

```

⟨XML: tag: TBP⟩+≡
    procedure :: set_attribute => tag_set_attribute
⟨XML: procedures⟩+≡
    subroutine tag_set_attribute (tag, i, value)
        class(xml_tag_t), intent(inout) :: tag
        integer, intent(in) :: i
        type(string_t), intent(in) :: value
        call tag%attribute(i)%set_value (value)
    end subroutine tag_set_attribute

```

Get an attribute value.

```

⟨XML: tag: TBP⟩+≡
    procedure :: get_attribute => tag_get_attribute
⟨XML: procedures⟩+≡
    function tag_get_attribute (tag, i) result (value)
        class(xml_tag_t), intent(in) :: tag
        integer, intent(in) :: i
        type(string_t) :: value
        value = tag%attribute(i)%get_value ()
    end function tag_get_attribute

```

Output to an I/O unit, default STDOUT. We use non-advancing output.

```

⟨XML: tag: TBP⟩+≡
    generic :: write => write_without_content
    procedure :: write_without_content => tag_write
⟨XML: procedures⟩+≡
    subroutine tag_write (tag, unit)
        class(xml_tag_t), intent(in) :: tag
        integer, intent(in), optional :: unit
        integer :: u, i
        u = given_output_unit (unit)
        write (u, "(<,A)", advance = "no") char (tag%name)
        do i = 1, size (tag%attribute)
            write (u, "(1x)", advance = "no")
            call tag%attribute(i)%write (u)
        end do
        if (tag%has_content) then
            write (u, "(>)", advance = "no")
        end if
    end subroutine tag_write

```

```

    else
        write (u, "(' />')", advance = "no")
    end if
end subroutine tag_write

```

If there is content, we should write the context next (arbitrary format), then write the corresponding closing tag. Again, non-advancing.

```

<XML: tag: TBP>+≡
procedure :: close => tag_close
<XML: procedures>+≡
subroutine tag_close (tag, unit)
    class(xml_tag_t), intent(in) :: tag
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)
    write (u, ("(</',A,'>)"), advance = "no")  char (tag%name)
end subroutine tag_close

```

Given content as a single string, we can write tag, content, and closing at once

```

<XML: tag: TBP>+≡
generic :: write => write_with_content
procedure :: write_with_content => tag_write_with_content
<XML: procedures>+≡
subroutine tag_write_with_content (tag, content, unit)
    class(xml_tag_t), intent(in) :: tag
    type(string_t), intent(in) :: content
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)
    call tag%write (u)
    write (u, "(A)", advance = "no")  char (content)
    call tag%close (u)
end subroutine tag_write_with_content

```

Input from stream. We know what we are looking for, so we check if the name matches, then fill attributes. We report an error if (a) an I/O error occurs, (b) we reach EOF before encountering the tag, (c) if the tag is incomplete.

Trailing text after reading a tag is put back to the input stream.

We assume that the tag is not broken across records, and that there is only one tag within the record. This is more restricted than standard XML.

```

<XML: tag: TBP>+≡
procedure :: read => tag_read
<XML: procedures>+≡
subroutine tag_read (tag, cstream, success)
    class(xml_tag_t), intent(inout) :: tag
    type(cstream_t), intent(inout) :: cstream
    logical, intent(out) :: success
    type(string_t) :: string
    integer :: iostat, p1, p2
    character(2), parameter :: WS = BLANK // TAB

```

```

```

#### 7.5.4 Unit tests

Test module, followed by the corresponding implementation module.

```

<xml_ut.f90>≡
  <File header>

  module xml_ut
    use unit_tests
    use xml_uti

  <Standard module head>

  <XML: public test>

  contains

  <XML: test driver>

  end module xml_ut

<xml_uti.f90>≡
  <File header>

  module xml_uti

  <Use strings>
    use io_units

  use xml

  <Standard module head>

```

```

⟨XML: test declarations⟩
contains
⟨XML: tests⟩
⟨XML: test auxiliary⟩
end module xml_uti
API: driver for the unit tests below.
⟨XML: public test⟩≡
public :: xml_test
⟨XML: test driver⟩≡
subroutine xml_test (u, results)
integer, intent(in) :: u
type(test_results_t), intent(inout) :: results
⟨XML: execute tests⟩
end subroutine xml_test

```

### 7.5.5 Auxiliary Routines

Show the contents of a temporary file, i.e., open unit.

```

⟨XML: test auxiliary⟩≡
subroutine show (u_tmp, u)
integer, intent(in) :: u_tmp, u
character (80) :: buffer
integer :: iostat
write (u, "(A)") "File content:"
rewind (u_tmp)
do
read (u_tmp, "(A)", iostat = iostat) buffer
if (iostat /= 0) exit
write (u, "(A)") trim (buffer)
end do
rewind (u_tmp)
end subroutine show

```

### 7.5.6 Basic Tag I/O

Write a tag and read it again, using a temporary file.

```

⟨XML: execute tests⟩≡
call test (xml_1, "xml_1", &
"basic I/O", &
u, results)
⟨XML: test declarations⟩≡
public :: xml_1

```

```

<XML: tests>≡
  subroutine xml_1 (u)
    integer, intent(in) :: u
    type(xml_tag_t), allocatable :: tag
    integer :: u_tmp
    type(cstream_t) :: cstream
    logical :: success

    write (u, "(A)") "* Test output: xml_1"
    write (u, "(A)") "* Purpose: write and read tag"
    write (u, "(A)")

    write (u, "(A)") "* Empty tag"
    write (u, *)

write (u, "(A)")  "Result from read:"
call cstream%init (u_tmp)
allocate (tag1)
call tag1%init (var_str ("option"))
call tag1%read (cstream, success)
call tag1%write (u)
write (u, *)
write (u, "(A,L1)")  "success = ", success
write (u, *)
allocate (tag2)
call tag2%init (var_str ("tagname"))
call tag2%read (cstream, success)
call tag2%write (u)
write (u, *)
write (u, "(A,L1)")  "success = ", success
deallocate (tag1, tag2)
call cstream%final ()

write (u, *)
write (u, "(A)")  "* Optional tag absent"
write (u, *)

u_tmp = free_unit ()
open (u_tmp, status = "scratch", action = "readwrite")

allocate (tag2)
call tag2%init (var_str ("tagname"))
call tag2%write (u_tmp)
write (u_tmp, *)
deallocate (tag2)

call show (u_tmp, u)

write (u, *)
write (u, "(A)")  "Result from read:"
call cstream%init (u_tmp)
allocate (tag1)
call tag1%init (var_str ("option"))
call tag1%read (cstream, success)
call tag1%write (u)
write (u, *)
write (u, "(A,L1)")  "success = ", success

```

```

    write (u, *)
    allocate (tag2)
    call tag2%init (var_str ("tagname"))
    call tag2%read (cstream, success)
    call tag2%write (u)
    write (u, *)
    write (u, "(A,L1)")  "success = ", success
    deallocate (tag1, tag2)
    call cstream%final ()

    write (u, "(A)")
    write (u, "(A)")  "* Test output end: xml_2"

end subroutine xml_2

```

### 7.5.8 Optional Tag

Write and read a tag with single-line content.

```

<XML: execute tests>+≡
    call test (xml_3, "xml_3", &
               "content", &
               u, results)

<XML: test declarations>+≡
    public :: xml_3

<XML: tests>+≡
    subroutine xml_3 (u)
        integer, intent(in) :: u
        type(xml_tag_t), allocatable :: tag
        integer :: u_tmp
        type(cstream_t) :: cstream
        logical :: success, closing
        type(string_t) :: content

        write (u, "(A)")  "* Test output: xml_3"
        write (u, "(A)")  "* Purpose: handle tag with content"
        write (u, "(A)")

        write (u, "(A)")  "* Tag without content"
        write (u, *)

        u_tmp = free_unit ()
        open (u_tmp, status = "scratch", action = "readwrite")

        allocate (tag)
        call tag%init (var_str ("tagname"))
        call tag%write (u_tmp)
        write (u_tmp, *)
        deallocate (tag)

        call show (u_tmp, u)

```

```

write (u, *)
write (u, "(A)")  "Result from read:"
call cstream%init (u_tmp)
allocate (tag)
call tag%init (var_str ("tagname"))
call tag%read (cstream, success)
call tag%write (u)
write (u, *)
write (u, "(A,L1)")  "success = ", success
write (u, "(A,L1)")  "content = ", tag%has_content
write (u, *)
deallocate (tag)
call cstream%final ()

write (u, "(A)")  "* Tag with content"
write (u, *)

write (u, *)
deallocate (tag)
call cstream%final ()

write (u, "(A)")
write (u, "(A)")  "* Test output end: xml_4"

end subroutine xml_4

```

# Chapter 8

# Random-Number Generator

These modules implement abstract types and tools for random-number generation.

**rng\_base** Abstract random-number generator and factory

**selectors** Selection depending on weights and random numbers

Implementation of the RNG abstract types:

**Module rng\_tao:** Interface to the TAO random number generator which the VAMP package provides. Note that VAMP explicitly requests this generator.

## 8.1 Generic Random-Number Generator

For all generator implementations, we define a `rng` type which represents the state of a random-number generator with the associated methods that produce a random number. Furthermore, we define a `rng_factory` type. An object of this type is capable of allocating a sequence of `rng` objects. These generator states should be, if possible, statistically independent, so they can be used in parallel in different places of the event-generation chain.

```
(rng_base.f90)≡
  ⟨File header⟩

  module rng_base

    ⟨Use kinds⟩
    use kinds, only: i16
    use constants, only: TWOPI

    ⟨Standard module head⟩

    ⟨RNG base: public⟩

    ⟨RNG base: types⟩

    ⟨RNG base: interfaces⟩

    contains

    ⟨RNG base: procedures⟩

  end module rng_base
```

### 8.1.1 Generator type

The `rng` object is actually the state of the random-number generator. The methods initialize/reset and call the generator for this state.

```
⟨RNG base: public⟩≡
  public :: rng_t

⟨RNG base: types⟩≡
  type, abstract :: rng_t
  contains
    ⟨RNG base: rng: TBP⟩
  end type rng_t
```

The `init` method initializes the generator and sets a seed. We should implement the interface such that a single integer is sufficient for a seed.

The seed may be omitted. The behavior without seed is not defined, however.

```
⟨RNG base: rng: TBP⟩≡
  procedure (rng_init), deferred :: init

⟨RNG base: interfaces⟩≡
  abstract interface
    subroutine rng_init (rng, seed)
```

```

import
class(rng_t), intent(out) :: rng
integer, intent(in), optional :: seed
end subroutine rng_init
end interface

```

The `final` method deallocates memory where necessary and allows for another call of `init` to reset the generator.

```

<RNG base: rng: TBP>+≡
procedure (rng_final), deferred :: final
<RNG base: interfaces>+≡
abstract interface
subroutine rng_final (rng)
import
class(rng_t), intent(inout) :: rng
end subroutine rng_final
end interface

```

Output. We should, at least, identify the generator.

```

<RNG base: rng: TBP>+≡
procedure (rng_write), deferred :: write
<RNG base: interfaces>+≡
abstract interface
subroutine rng_write (rng, unit, indent)
import
class(rng_t), intent(in) :: rng
integer, intent(in), optional :: unit, indent
end subroutine rng_write
end interface

```

These routines generate a single and an array of uniformly distributed default-precision random numbers, respectively.

```

<RNG base: rng: TBP>+≡
generic :: generate => generate_single, generate_array
procedure (rng_generate_single), deferred :: generate_single
procedure (rng_generate_array), deferred :: generate_array
<RNG base: interfaces>+≡
abstract interface
subroutine rng_generate_single (rng, x)
import
class(rng_t), intent(inout) :: rng
real(default), intent(out) :: x
end subroutine rng_generate_single
end interface

abstract interface
subroutine rng_generate_array (rng, x)
import
class(rng_t), intent(inout) :: rng
real(default), dimension(:, ), intent(out) :: x

```

```

    end subroutine rng_generate_array
end interface

```

These routines generate a single and an array of Gaussian (normal) distributed default-precision random numbers, respectively. Mean is 0 and  $\sigma = 1$ . Note that  $z = \mu + \sigma x$  then distributes with mean  $\mu$  and variance  $\sigma^2$ .

The algorithm uses twice as much uniformly distributed random numbers, taken from the PDG review.

```

⟨RNG base: rng: TBP⟩+≡
  generic :: generate_gaussian => &
    rng_generate_gaussian_single, rng_generate_gaussian_array
  procedure, private :: rng_generate_gaussian_single
  procedure, private :: rng_generate_gaussian_array

⟨RNG base: procedures⟩≡
  subroutine rng_generate_gaussian_single (rng, x)
    class(rng_t), intent(inout) :: rng
    real(default), intent(out) :: x
    real(default), dimension(2) :: u
    call rng%generate (u)
    x = sin (twopi * u(1)) * sqrt (- 2 * log (u(2)))
  end subroutine rng_generate_gaussian_single

  subroutine rng_generate_gaussian_array (rng, x)
    class(rng_t), intent(inout) :: rng
    real(default), dimension(:, ), intent(out) :: x
    integer :: i
    do i = 1, size (x)
      call rng%generate_gaussian (x(i))
    end do
  end subroutine rng_generate_gaussian_array

```

### 8.1.2 RNG Factory

A factory object has a `make` method that allocates and initializes a new generator of appropriate type. It uses a 16-bit integer for initialization. For a real-life implementation, the factory should return a sequence of statistically independent generators, and for different seeds, the sequences should also be independent.

```

⟨RNG base: public⟩+≡
  public :: rng_factory_t

⟨RNG base: types⟩+≡
  type, abstract :: rng_factory_t
  contains
    ⟨RNG base: rng factory: TBP⟩
  end type rng_factory_t

```

Output. Should be short, just report the seed and current state of the factory.

```

⟨RNG base: rng factory: TBP⟩≡
  procedure (rng_factory_write), deferred :: write

```

```

⟨RNG base: interfaces⟩+≡
  abstract interface
    subroutine rng_factory_write (object, unit)
      import
      class(rng_factory_t), intent(in) :: object
      integer, intent(in), optional :: unit
    end subroutine rng_factory_write
  end interface

```

Initialize. It should be possible to do this repeatedly, resetting the state. The default seed should be 0.

```

⟨RNG base: rng factory: TBP⟩+≡
  procedure (rng_factory_init), deferred :: init
⟨RNG base: interfaces⟩+≡
  abstract interface
    subroutine rng_factory_init (factory, seed)
      import
      class(rng_factory_t), intent(out) :: factory
      integer(i16), intent(in), optional :: seed
    end subroutine rng_factory_init
  end interface

```

Spawn a new generator.

```

⟨RNG base: rng factory: TBP⟩+≡
  procedure (rng_factory_make), deferred :: make
⟨RNG base: interfaces⟩+≡
  abstract interface
    subroutine rng_factory_make (factory, rng)
      import
      class(rng_factory_t), intent(inout) :: factory
      class(rng_t), intent(out), allocatable :: rng
    end subroutine rng_factory_make
  end interface

```

### 8.1.3 Unit tests

Test module, followed by the corresponding implementation module.

```

⟨rng_base_ut.f90⟩≡
  ⟨File header⟩

  module rng_base_ut
    use unit_tests
    use rng_base_ut
  end module

  ⟨Standard module head⟩

  ⟨RNG base: public test⟩

  ⟨RNG base: public test auxiliary⟩

```

```

contains

⟨RNG base: test driver⟩

end module rng_base_ut

⟨rng_base_ut.f90⟩≡
⟨File header⟩

module rng_base_ut

⟨Use kinds⟩
use kinds, only: i16
use format_utils, only: write_indent
use io_units

use rng_base

⟨Standard module head⟩

⟨RNG base: public test auxiliary⟩

⟨RNG base: test declarations⟩

⟨RNG base: test types⟩

contains

⟨RNG base: tests⟩

⟨RNG base: test auxiliary⟩

end module rng_base_ut

```

API: driver for the unit tests below.

```

⟨RNG base: public test⟩≡
public :: rng_base_test

⟨RNG base: test driver⟩≡
subroutine rng_base_test (u, results)
integer, intent(in) :: u
type(test_results_t), intent(inout) :: results
⟨RNG base: execute tests⟩
end subroutine rng_base_test

```

### Test generator

The test 'mock' random generator generates a repeating series with the numbers 0.1, 0.3, 0.5, 0.7, 0.9. It has an integer stored as state. The integer must be one of 1, 3, 5, 7, 9.

```

⟨RNG base: public test auxiliary⟩≡
public :: rng_test_t

```

```
(RNG base: test types)≡
  type, extends (rng_t) :: rng_test_t
    integer :: state = 1
  contains
    procedure :: write => rng_test_write
    procedure :: init => rng_test_init
    procedure :: final => rng_test_final
    procedure :: generate_single => rng_test_generate_single
    procedure :: generate_array => rng_test_generate_array
  end type rng_test_t
```

Output. The state is a single number, so print it.

```
(RNG base: test auxiliary)≡
  subroutine rng_test_write (rng, unit, indent)
    class(rng_test_t), intent(in) :: rng
    integer, intent(in), optional :: unit, indent
    integer :: u, ind
    u = given_output_unit (unit)
    ind = 0; if (present (indent)) ind = indent
    call write_indent (u, ind)
    write (u, "(A,I0,A)") "Random-number generator: &
      &test (state = ", rng%state, ")"
  end subroutine rng_test_write
```

The default seed is 1.

```
(RNG base: test auxiliary)+≡
  subroutine rng_test_init (rng, seed)
    class(rng_test_t), intent(out) :: rng
    integer, intent(in), optional :: seed
    if (present (seed)) rng%state = seed
  end subroutine rng_test_init
```

Nothing to finalize:

```
(RNG base: test auxiliary)+≡
  subroutine rng_test_final (rng)
    class(rng_test_t), intent(inout) :: rng
  end subroutine rng_test_final
```

Generate a single number and advance the state.

```
(RNG base: test auxiliary)+≡
  subroutine rng_test_generate_single (rng, x)
    class(rng_test_t), intent(inout) :: rng
    real(default), intent(out) :: x
    x = rng%state / 10._default
    rng%state = mod (rng%state + 2, 10)
  end subroutine rng_test_generate_single
```

The array generator calls the single-item generator multiple times.

```
(RNG base: test auxiliary)+≡
  subroutine rng_test_generate_array (rng, x)
    class(rng_test_t), intent(inout) :: rng
```

```

real(default), dimension(:), intent(out) :: x
integer :: i
do i = 1, size (x)
    call rng%generate (x(i))
end do
end subroutine rng_test_generate_array

```

### Test Factory

This factory makes `rng_test_t` generators, initialized with integers 1, 3, 5, 7, 9 if given the input 0, 1, 2, 3, 4. The generators within one sequence are all identical, however.

```

⟨RNG base: public test auxiliary⟩+≡
    public :: rng_test_factory_t

⟨RNG base: test types⟩+≡
    type, extends (rng_factory_t) :: rng_test_factory_t
        integer :: seed = 1
        contains
            ⟨RNG base: rng test factory: TBP⟩
    end type rng_test_factory_t

```

Output.

```

⟨RNG base: rng test factory: TBP⟩≡
    procedure :: write => rng_test_factory_write

⟨RNG base: test auxiliary⟩+≡
    subroutine rng_test_factory_write (object, unit)
        class(rng_test_factory_t), intent(in) :: object
        integer, intent(in), optional :: unit
        integer :: u
        u = given_output_unit (unit)
        write (u, "(1x,A,I0,A)") "RNG factory: test (", object%seed, ")"
    end subroutine rng_test_factory_write

```

Initialize, translating the given seed.

```

⟨RNG base: rng test factory: TBP⟩+≡
    procedure :: init => rng_test_factory_init

⟨RNG base: test auxiliary⟩+≡
    subroutine rng_test_factory_init (factory, seed)
        class(rng_test_factory_t), intent(out) :: factory
        integer(i16), intent(in), optional :: seed
        if (present (seed)) factory%seed = mod (seed * 2 + 1, 10)
    end subroutine rng_test_factory_init

```

```

⟨RNG base: rng test factory: TBP⟩+≡
    procedure :: make => rng_test_factory_make

```

```

⟨RNG base: test auxiliary⟩+≡
  subroutine rng_test_factory_make (factory, rng)
    class(rng_test_factory_t), intent(inout) :: factory
    class(rng_t), intent(out), allocatable :: rng
    allocate (rng_test_t :: rng)
    select type (rng)
    type is (rng_test_t)
      call rng%init (int (factory%seed))
    end select
  end subroutine rng_test_factory_make

```

### Generator check

Initialize the generator and draw random numbers.

```

⟨RNG base: execute tests⟩≡
  call test (rng_base_1, "rng_base_1", &
             "rng initialization and call", &
             u, results)

⟨RNG base: test declarations⟩≡
  public :: rng_base_1

⟨RNG base: tests⟩≡
  subroutine rng_base_1 (u)
    integer, intent(in) :: u
    class(rng_t), allocatable :: rng

    real(default) :: x
    real(default), dimension(2) :: x2

    write (u, "(A)")  "* Test output: rng_base_1"
    write (u, "(A)")  "* Purpose: initialize and call a test random-number &
                      &generator"
    write (u, "(A)")

    write (u, "(A)")  "* Initialize generator"
    write (u, "(A)")

    allocate (rng_test_t :: rng)
    call rng%init (3)

    call rng%write (u)

    write (u, "(A)")
    write (u, "(A)")  "* Get random number"
    write (u, "(A)")

    call rng%generate (x)
    write (u, "(A,2(1x,F9.7))")  "x =", x

    write (u, "(A)")
    write (u, "(A)")  "* Get random number pair"
    write (u, "(A)")

```

```

call rng%generate (x2)
write (u, "(A,2(1x,F9.7))") "x =", x2

write (u, "(A)")
write (u, "(A)") "* Cleanup"

call rng%final ()

write (u, "(A)")
write (u, "(A)") "* Test output end: rng_base_1"

end subroutine rng_base_1

```

### Factory check

Set up a factory and spawn generators.

```

<RNG base: execute tests>+≡
  call test (rng_base_2, "rng_base_2", &
             "rng factory", &
             u, results)

<RNG base: test declarations>+≡
  public :: rng_base_2

<RNG base: tests>+≡
  subroutine rng_base_2 (u)
    integer, intent(in) :: u
    type(rng_test_factory_t) :: rng_factory
    class(rng_t), allocatable :: rng

    write (u, "(A)") "* Test output: rng_base_2"
    write (u, "(A)") "* Purpose: initialize and use a rng factory"
    write (u, "(A)")

    write (u, "(A)") "* Initialize factory"
    write (u, "(A)")

    call rng_factory%init ()
    call rng_factory%write (u)

    write (u, "(A)")
    write (u, "(A)") "* Make a generator"
    write (u, "(A)")

    call rng_factory%make (rng)
    call rng%write (u)

    write (u, "(A)")
    write (u, "(A)") "* Cleanup"

    call rng%final ()

    write (u, "(A)")
    write (u, "(A)") "* Test output end: rng_base_2"

```

```
end subroutine rng_base_2
```

## 8.2 Select from a weighted sample

```
<selectors.f90>≡
  <File header>

  module selectors

    <Use kinds>
      use io_units
      use diagnostics
      use rng_base

    <Standard module head>

    <Selectors: public>

    <Selectors: types>

    contains

    <Selectors: procedures>

  end module selectors
```

### 8.2.1 Selector type

The rng object is actually the state of the random-number generator. The methods initialize/reset and call the generator for this state.

```
<Selectors: public>≡
  public :: selector_t

<Selectors: types>≡
  type :: selector_t
    integer, dimension(:), allocatable :: map
    real(default), dimension(:), allocatable :: weight
    real(default), dimension(:), allocatable :: acc
  contains
    <Selectors: selector: TBP>
  end type selector_t
```

Display contents.

```
<Selectors: selector: TBP>≡
  procedure :: write => selector_write

<Selectors: procedures>≡
  subroutine selector_write (object, unit)
    class(selector_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u, i
    u = given_output_unit (unit)
    write (u, "(1x,A)") "Selector: i, weight, acc. weight"
    if (allocated (object%weight)) then
      do i = 1, size (object%weight)
        write (u, "(3x,I0,1x,ES19.12,1x,ES19.12)") &
```

```

        object%map(i), object%weight(i), object%acc(i)
    end do
else
    write (u, "(3x,A)" ) "[undefined]"
end if
end subroutine selector_write

```

We pack the input weight array such that zero-weight entries are removed. We also normalize it. This makes a map array for mapping the selected weight to the actual entry necessary.

We may encounter a case where all weights are zero. We do not reject this, but set up the selector so that it always returns the first entry.

```

<Selectors: selector: TBP>+≡
procedure :: init => selector_init
<Selectors: procedures>+≡
subroutine selector_init (selector, weight)
    class(selector_t), intent(out) :: selector
    real(default), dimension(:), intent(in) :: weight
    real(default) :: s
    integer :: n, i
    logical, dimension(:), allocatable :: mask
    if (size (weight) == 0) &
        call msg_bug ("Selector init: zero-size weight array")
    if (any (weight < 0)) &
        call msg_bug ("Selector init: negative weight")
    s = sum (weight)
    allocate (mask (size (weight)), &
              source = weight /= 0)
    n = count (mask)
    if (n > 0) then
        allocate (selector%map (n), &
                  source = pack ([(i, i = 1, size (weight))], mask))
        allocate (selector%weight (n), &
                  source = pack (weight / s, mask))
        allocate (selector%acc (n))
        selector%acc(1) = selector%weight(1)
        do i = 2, n - 1
            selector%acc(i) = selector%acc(i-1) + selector%weight(i)
        end do
        selector%acc(n) = 1
    else
        allocate (selector%map (1), source = 1)
        allocate (selector%weight (1), source = 0._default)
        allocate (selector%acc (1), source = 1._default)
    end if
end subroutine selector_init

```

Select an entry based upon the number  $x$ , which should be a uniformly distributed random number between 0 and 1.

```

<Selectors: selector: TBP>+≡
procedure :: select => selector_select

```

```

⟨>Selectors: procedures⟩+≡
    function selector_select (selector, x) result (n)
        class(selector_t), intent(in) :: selector
        real(default), intent(in) :: x
        integer :: n
        integer :: i
        if (x < 0 .or. x > 1) &
            call msg_bug ("Selector: random number out of range")
        do i = 1, size (selector%acc)
            if (x <= selector%acc(i))  exit
        end do
        n = selector%map(i)
    end function selector_select

```

Use the provided random-number generator to select an entry. (Unless there is only one entry.)

```

⟨>Selectors: selector: TBP⟩+≡
    procedure :: generate => selector_generate
⟨>Selectors: procedures⟩+≡
    subroutine selector_generate (selector, rng, n)
        class(selector_t), intent(in) :: selector
        class(rng_t), intent(inout) :: rng
        integer, intent(out) :: n
        real(default) :: x
        select case (size (selector%acc))
        case (1);  n = 1
        case default
            call rng%generate (x)
            n = selector%select (x)
        end select
    end subroutine selector_generate

```

Determine the normalized weight for a selected entry. We use a linear search for the inverse lookup, assuming that efficiency is not an issue for this function.

```

⟨>Selectors: selector: TBP⟩+≡
    procedure :: get_weight => selector_get_weight
⟨>Selectors: procedures⟩+≡
    function selector_get_weight (selector, n) result (weight)
        class(selector_t), intent(in) :: selector
        integer, intent(in) :: n
        real(default) :: weight
        integer :: i
        do i = 1, size (selector%weight)
            if (selector%map(i) == n) then
                weight = selector%weight(i)
                return
            end if
        end do
        weight = 0
    end function selector_get_weight

```

### 8.2.2 Unit tests

Test module, followed by the corresponding implementation module.

`(selectors_ut.f90)≡  
 <File header>`

```
module selectors_ut
  use unit_tests

```
  use rng_base
```

```
  use selectors
```

```
  use rng_base_ut, only: rng_test_t
```

`<Standard module head>`

`<Selectors: test declarations>`

`contains`

`<Selectors: tests>`

```
end module selectors_uti
```

API: driver for the unit tests below.

`<Selectors: public test>≡  
 public :: selectors_test`

`<Selectors: test driver>≡  
 subroutine selectors_test (u, results)  
 integer, intent(in) :: u  
 type(test_results_t), intent(inout) :: results`

`<Selectors: execute tests>`

`end subroutine selectors_test`

## Basic check

Initialize the selector and draw random numbers.

```
<Selectors: execute tests>≡
    call test (selectors_1, "selectors_1", &
               "rng initialization and call", &
               u, results)

<Selectors: test declarations>≡
    public :: selectors_1

<Selectors: tests>≡
    subroutine selectors_1 (u)
        integer, intent(in) :: u
        type(selector_t) :: selector
        class(rng_t), allocatable, target :: rng
        integer :: i, n

        write (u, "(A)")    "* Test output: selectors_1"
        write (u, "(A)")    "* Purpose: initialize a selector and test it"
        write (u, "(A)")

        write (u, "(A)")    "* Initialize selector"
        write (u, "(A)")

        call selector%init &
            ([2._default, 3.5_default, 0._default, &
             2._default, 0.5_default, 2._default])
        call selector%write (u)

        write (u, "(A)")
        write (u, "(A)")    "* Select numbers using predictable test generator"
        write (u, "(A)")

        allocate (rng_test_t :: rng)
        call rng%init (1)

        do i = 1, 5
            call selector%generate (rng, n)
            write (u, "(1x,I0)") n
        end do

        write (u, "(A)")
        write (u, "(A)")    "* Select numbers using real input number"
        write (u, "(A)")

        write (u, "(1x,A,I0)") "select(0.00) = ", selector%select (0._default)
        write (u, "(1x,A,I0)") "select(0.77) = ", selector%select (0.77_default)
        write (u, "(1x,A,I0)") "select(1.00) = ", selector%select (1._default)

        write (u, "(A)")
        write (u, "(A)")    "* Get weight"
        write (u, "(A)")

        write (u, "(1x,A,ES19.12)") "weight(2) =", selector%get_weight(2)
```

```

    write (u, "(1x,A,ES19.12)") "weight(3) =", selector%get_weight(3)

    write (u, "(A)")
    write (u, "(A)") "* Cleanup"

    call rng%final ()

    write (u, "(A)")
    write (u, "(A)") "* Test output end: selectors_1"

end subroutine selectors_1

```

### 8.3 TAO Random-Number Generator

This module provides an implementation for the generic random-number generator. Actually, we interface the TAO random-number generator which is available via the VAMP package.

```

<rng_tao.f90>≡
  <File header>

  module rng_tao

  <Use kinds>
    use io_units
    use format_utils, only: write_indent
    use tao_random_numbers !NODEP!

    use rng_base

  <Standard module head>

  <RNG tao: public>

  <RNG tao: types>

  contains

  <RNG tao: procedures>

  end module rng_tao

```

#### 8.3.1 Generator type

The `rng` object is actually the state of the random-number generator. The methods initialize/reset and call the generator for this state.

We keep the seed, in case we want to recover it later, and count the number of calls since seeding.

```

<RNG tao: public>≡
  public :: rng_tao_t

```

```

⟨RNG tao: types⟩≡
  type, extends (rng_t) :: rng_tao_t
    integer :: seed = 0
    integer :: n_calls = 0
    type(tao_random_state) :: state
  contains
    ⟨RNG tao: rng tao: TBP⟩
  end type rng_tao_t

```

Output: Display seed and number of calls.

```

⟨RNG tao: rng tao: TBP⟩≡
  procedure :: write => rng_tao_write
⟨RNG tao: procedures⟩≡
  subroutine rng_tao_write (rng, unit, indent)
    class(rng_tao_t), intent(in) :: rng
    integer, intent(in), optional :: unit, indent
    integer :: u, ind
    u = given_output_unit (unit)
    ind = 0; if (present (indent)) ind = indent
    call write_indent (u, ind)
    write (u, "(A)") "TAO random-number generator:"
    call write_indent (u, ind)
    write (u, "(2x,A,IO)") "seed = ", rng%seed
    call write_indent (u, ind)
    write (u, "(2x,A,IO)") "calls = ", rng%n_calls
  end subroutine rng_tao_write

```

The `init` method initializes the generator and sets a seed. We should implement the interface such that a single integer is sufficient for a seed.

The seed may be omitted. The default seed is 0.

```

⟨RNG tao: rng tao: TBP⟩+≡
  procedure :: init => rng_tao_init
⟨RNG tao: procedures⟩+≡
  subroutine rng_tao_init (rng, seed)
    class(rng_tao_t), intent(out) :: rng
    integer, intent(in), optional :: seed
    if (present (seed)) rng%seed = seed
    call tao_random_create (rng%state, rng%seed)
  end subroutine rng_tao_init

```

The `final` method deallocates memory where necessary and allows for another call of `init` to reset the generator.

```

⟨RNG tao: rng tao: TBP⟩+≡
  procedure :: final => rng_tao_final
⟨RNG tao: procedures⟩+≡
  subroutine rng_tao_final (rng)
    class(rng_tao_t), intent(inout) :: rng
    call tao_random_destroy (rng%state)
  end subroutine rng_tao_final

```

These routines generate a single and an array of default-precision random numbers, respectively.

We have to convert from explicit double to abstract default precision. Under normal conditions, both are equivalent, however. Unless, someone decides to do single precision, there is always an interface for `tao_random_numbers`.

```
(RNG tao: rng tao: TBP)+≡
procedure :: generate_single => rng_tao_generate_single
procedure :: generate_array => rng_tao_generate_array

(RNG tao: procedures)+≡
subroutine rng_tao_generate_single (rng, x)
  class(rng_tao_t), intent(inout) :: rng
  real(default), intent(out) :: x
  real(default) :: r
  call tao_random_number (rng%state, r)
  x = r
  rng%n_calls = rng%n_calls + 1
end subroutine rng_tao_generate_single

subroutine rng_tao_generate_array (rng, x)
  class(rng_tao_t), intent(inout) :: rng
  real(default), dimension(:), intent(out) :: x
  real(default) :: r
  integer :: i
  do i = 1, size (x)
    call tao_random_number (rng%state, r)
    x(i) = r
  end do
  rng%n_calls = rng%n_calls + size (x)
end subroutine rng_tao_generate_array
```

## Factory

This factory makes `rng_tao_t` generators, initialized with the seeds

$$s_i = s_0 * 2^{16} + i \quad (8.1)$$

where  $s_0$  is the seed (a 16-bit integer) given to the factory object, and  $i$  is the index in the generated sequence of generators, starting with zero.

```
(RNG tao: public)+≡
public :: rng_tao_factory_t

(RNG tao: types)+≡
type, extends (rng_factory_t) :: rng_tao_factory_t
  integer(i16) :: s = 0
  integer(i16) :: i = 0
contains
(RNG tao: rng tao factory: TBP)
end type rng_tao_factory_t
```

Output.

```
(RNG tao: rng tao factory: TBP)≡
procedure :: write => rng_tao_factory_write
```

```

⟨RNG tao: procedures⟩+≡
    subroutine rng_tao_factory_write (object, unit)
        class(rng_tao_factory_t), intent(in) :: object
        integer, intent(in), optional :: unit
        integer :: u
        u = given_output_unit (unit)
        write (u, "(1x,A,2(IO,A))") &
            "RNG factory: tao (", object% s, ", ", object% i, ")"
    end subroutine rng_tao_factory_write

```

Initialize, translating the given seed.

```

⟨RNG tao: rng tao factory: TBP⟩+≡
    procedure :: init => rng_tao_factory_init
⟨RNG tao: procedures⟩+≡
    subroutine rng_tao_factory_init (factory, seed)
        class(rng_tao_factory_t), intent(out) :: factory
        integer(i16), intent(in), optional :: seed
        if (present (seed)) factory% s = seed
    end subroutine rng_tao_factory_init

```

```

⟨RNG tao: rng tao factory: TBP⟩+≡
    procedure :: make => rng_tao_factory_make
⟨RNG tao: procedures⟩+≡
    subroutine rng_tao_factory_make (factory, rng)
        class(rng_tao_factory_t), intent(inout) :: factory
        class(rng_t), intent(out), allocatable :: rng
        allocate (rng_tao_t :: rng)
        select type (rng)
        type is (rng_tao_t)
            call rng% init (factory% s * 65536 + factory% i)
            factory% i = int (factory% i + 1, kind = i16)
        end select
    end subroutine rng_tao_factory_make

```

### 8.3.2 Unit tests

Test module, followed by the corresponding implementation module.

```

⟨RNG tao: public test⟩≡
public :: rng_tao_test

⟨RNG tao: test driver⟩≡
subroutine rng_tao_test (u, results)
integer, intent(in) :: u
type(test_results_t), intent(inout) :: results
⟨RNG tao: execute tests⟩
end subroutine rng_tao_test

```

### Generator check

Initialize the generator and draw random numbers.

```

⟨RNG tao: execute tests⟩≡
call test (rng_tao_1, "rng_tao_1", &
           "rng initialization and call", &
           u, results)

⟨RNG tao: test declarations⟩≡
public :: rng_tao_1

⟨RNG tao: tests⟩≡
subroutine rng_tao_1 (u)
integer, intent(in) :: u
class(rng_t), allocatable, target :: rng

real(default) :: x
real(default), dimension(2) :: x2

```

```

write (u, "(A)")    "* Test output: rng_tao_1"
write (u, "(A)")    "* Purpose: initialize and call the TAO random-number &
&generator"
write (u, "(A)")

write (u, "(A)")    "* Initialize generator (default seed)"
write (u, "(A)")

allocate (rng_tao_t :: rng)
call rng%init ()

call rng%write (u)

write (u, "(A)")
write (u, "(A)")    "* Get random number"
write (u, "(A)")

call rng%generate (x)
write (u, "(A,2(1x,F9.7))") "x =", x

write (u, "(A)")
write (u, "(A)")    "* Get random number pair"
write (u, "(A)")

call rng%generate (x2)
write (u, "(A,2(1x,F9.7))") "x =", x2

write (u, "(A)")
call rng%write (u)

write (u, "(A)")
write (u, "(A)")    "* Cleanup"

call rng%final ()

write (u, "(A)")
write (u, "(A)")    "* Test output end: rng_tao_1"

end subroutine rng_tao_1

```

### Factory check

Set up a factory and spawn generators.

```

⟨RNG tao: execute tests⟩+≡
  call test (rng_tao_2, "rng_tao_2", &
             "rng factory", &
             u, results)

⟨RNG tao: test declarations⟩+≡
  public :: rng_tao_2

⟨RNG tao: tests⟩+≡
  subroutine rng_tao_2 (u)
    integer, intent(in) :: u

```

```

type(rng_tao_factory_t) :: rng_factory
class(rng_t), allocatable :: rng
real(default) :: x

write (u, "(A)")  "* Test output: rng_tao_2"
write (u, "(A)")  "* Purpose: initialize and use a rng factory"
write (u, "(A)")

write (u, "(A)")  "* Initialize factory"
write (u, "(A)")

call rng_factory%init ()
call rng_factory%write (u)

write (u, "(A)")
write (u, "(A)")  "* Make a generator"
write (u, "(A)")

call rng_factory%make (rng)
call rng%write (u)
call rng%generate (x)
write (u, *)
write (u, "(1x,A,F7.5)")  "x = ", x
call rng%final ()
deallocate (rng)

write (u, "(A)")
write (u, "(A)")  "* Repeat"
write (u, "(A)")

call rng_factory%make (rng)
call rng%write (u)
call rng%generate (x)
write (u, *)
write (u, "(1x,A,F7.5)")  "x = ", x
call rng%final ()
deallocate (rng)

write (u, *)
call rng_factory%write (u)

write (u, "(A)")
write (u, "(A)")  "* Initialize factory with different seed"
write (u, "(A)")

call rng_factory%init (1_i16)
call rng_factory%write (u)

write (u, "(A)")
write (u, "(A)")  "* Make a generator"
write (u, "(A)")

call rng_factory%make (rng)
call rng%write (u)

```

```
call rng%generate (x)
write (u, *)
write (u, "(1x,A,F7.5)")  "x = ", x
call rng%final ()
deallocate (rng)

write (u, *)
call rng_factory%write (u)

write (u, "(A)")
write (u, "(A)")  "* Test output end: rng_tao_2"

end subroutine rng_tao_2
```

# Chapter 9

## Physics

Here we collect definitions and functions that we need for (particle) physics in general, to make them available for the more specific needs of WHIZARD.

**physics\_defs** Physical constants.

**c\_particles** A simple data type for particles which is C compatible.

**lorentz** Define three-vectors, four-vectors and Lorentz transformations and common operations for them.

**sm\_physics** Here, running functions are stored for special kinematical setup like running coupling constants, Catani-Seymour dipoles, or Sudakov factors.

**sm\_qcd** Definitions and methods for dealing with the running QCD coupling.

**shower\_algorithms** Algorithms typically used in Parton Showers as well as in their matching to NLO computations, e.g. with the POWHEG method.

## 9.1 Physics Constants

There is also the generic `constants` module. The constants listed here are more specific for particle physics.

```
(physics_defs.f90)≡
  ⟨File header⟩

  module physics_defs

  ⟨Use kinds⟩
    use constants, only: one, two, three

  ⟨Standard module head⟩

  ⟨Physics defs: public parameters⟩

  end module physics_defs
```

### 9.1.1 Units

Conversion from energy units to cross-section units.

```
(Physics defs: public parameters)≡
  real(default), parameter, public :: &
  conv = 0.38937966e12_default
```

Rescaling factor.

```
(Physics defs: public parameters)+≡
  real(default), parameter, public :: &
  pb_per_fb = 1.e-3_default
```

String for the default energy and cross-section units.

```
(Physics defs: public parameters)+≡
  character(*), parameter, public :: &
  energy_unit = "GeV"
  character(*), parameter, public :: &
  cross_section_unit = "fb"
```

### 9.1.2 SM and QCD constants

```
(Physics defs: public parameters)+≡
  real(default), parameter, public :: &
  NC = three, &
  CF = (NC**2 - one) / two / NC, &
  CA = NC, &
  TR = one / two
```

### 9.1.3 Parameter Reference values

These are used exclusively in the context of running QCD parameters. In other contexts, we rely on the uniform parameter set as provided by the model definition, modifiable by the user.

```
(Physics defs: public parameters)+≡
```

```

real(default), public, parameter :: MZ_REF = 91.188_default
real(default), public, parameter :: ALPHA_QCD_MZ_REF = 0.1178_default
real(default), public, parameter :: LAMBDA_QCD_REF = 200.e-3_default

```

### 9.1.4 Particle codes

Let us define a few particle codes independent of the model.

We need an UNDEFINED value:

```

⟨Physics defs: public parameters⟩+≡
    integer, parameter, public :: UNDEFINED = 0

```

SM fermions:

```

⟨Physics defs: public parameters⟩+≡
    integer, parameter, public :: ELECTRON = 11
    integer, parameter, public :: ELECTRON_NEUTRINO = 12
    integer, parameter, public :: MUON = 13
    integer, parameter, public :: MUON_NEUTRINO = 14
    integer, parameter, public :: TAU = 15
    integer, parameter, public :: TAU_NEUTRINO = 16

```

Gauge bosons:

```

⟨Physics defs: public parameters⟩+≡
    integer, parameter, public :: GLUON = 21
    integer, parameter, public :: PHOTON = 22
    integer, parameter, public :: Z_BOSON = 23
    integer, parameter, public :: W_BOSON = 24

```

Light mesons:

```

⟨Physics defs: public parameters⟩+≡
    integer, parameter, public :: PION = 111
    integer, parameter, public :: PIPLUS = 211
    integer, parameter, public :: PIMINUS = - PIPLUS

```

Di-Quarks:

```

⟨Physics defs: public parameters⟩+≡
    integer, parameter, public :: UDO = 2101
    integer, parameter, public :: UD1 = 2103
    integer, parameter, public :: UU1 = 2203

```

Mesons:

```

⟨Physics defs: public parameters⟩+≡
    integer, parameter, public :: KOL = 130
    integer, parameter, public :: KOS = 310
    integer, parameter, public :: KO = 311
    integer, parameter, public :: KPLUS = 321
    integer, parameter, public :: DPLUS = 411
    integer, parameter, public :: DO = 421
    integer, parameter, public :: BO = 511
    integer, parameter, public :: BPLUS = 521

```

Light baryons:

```
(Physics defs: public parameters)+≡  
    integer, parameter, public :: PROTON = 2212  
    integer, parameter, public :: NEUTRON = 2112  
    integer, parameter, public :: DELTAPLUSPLUS = 2224  
    integer, parameter, public :: DELTAPLUS = 2214  
    integer, parameter, public :: DELTA0 = 2114  
    integer, parameter, public :: DELTAMINUS = 1114
```

Strange baryons:

```
(Physics defs: public parameters)+≡  
    integer, parameter, public :: SIGMAPLUS = 3222  
    integer, parameter, public :: SIGMA0 = 3212  
    integer, parameter, public :: SIGMAMINUS = 3112
```

Charmed baryons:

```
(Physics defs: public parameters)+≡  
    integer, parameter, public :: SIGMACPLUSPLUS = 4222  
    integer, parameter, public :: SIGMACPLUS = 4212  
    integer, parameter, public :: SIGMACO = 4112
```

Bottom baryons:

```
(Physics defs: public parameters)+≡  
    integer, parameter, public :: SIGMAB0 = 5212  
    integer, parameter, public :: SIGMABPLUS = 5222
```

81-100 are reserved for internal codes. Hadron and beam remnants:

```
(Physics defs: public parameters)+≡  
    integer, parameter, public :: BEAM_REMNANT = 9999  
    integer, parameter, public :: HADRON_REMNANT = 90  
    integer, parameter, public :: HADRON_REMNANT_SINGLETON = 91  
    integer, parameter, public :: HADRON_REMNANT_TRIPLET = 92  
    integer, parameter, public :: HADRON_REMNANT_OCTET = 93
```

Further particle codes for internal use:

```
(Physics defs: public parameters)+≡  
    integer, parameter, public :: INTERNAL = 94  
    integer, parameter, public :: INVALID = 97  
  
    integer, parameter, public :: COMPOSITE = 99
```

### 9.1.5 Spin codes

Somewhat redundant, but for better readability we define named constants for spin types. If the mass is nonzero, this is equal to the number of degrees of freedom.

```
(Physics defs: public parameters)+≡  
    integer, parameter, public :: UNKNOWN = 0  
    integer, parameter, public :: SCALAR = 1, SPINOR = 2, VECTOR = 3, &
```

```
VECTORSPINOR = 4, TENSOR = 5
```

Isospin types and charge types are counted in an analogous way, where charge type 1 is charge 0, 2 is charge 1/3, and so on. Zero always means unknown. Note that charge and isospin types have an explicit sign.

Color types are defined as the dimension of the representation.

### 9.1.6 NLO status codes

Used to specify whether a component of a process instance is associated with a Born, real-subtracted, virtual-subtracted or subtraction-dummy matrix element.

```
Physics defs: public parameters+≡  
integer, parameter, public :: BORN = 0  
integer, parameter, public :: NLO_REAL = 1  
integer, parameter, public :: NLO_VIRTUAL = 2  
integer, parameter, public :: NLO_PDF = 3  
integer, parameter, public :: NLO_SUBTRACTION = 4  
integer, parameter, public :: GKS = 5
```

## 9.2 C-compatible Particle Type

For easy communication with C code, we introduce a simple C-compatible type for particles. The components are either default C integers or default C doubles.

The `c_prt` type is transparent, and its contents should be regarded as part of the interface.

```

<c_particles.f90>≡
  ⟨File header⟩

  module c_particles

    use, intrinsic :: iso_c_binding !NODEP!

    use io_units
    use format_defs, only: FMT_14, FMT_19

  ⟨Standard module head⟩

  <C Particles: public⟩

  <C Particles: types⟩

  contains

  <C Particles: procedures⟩
  end module c_particles

  <C Particles: public>≡
    public :: c_prt_t

  <C Particles: types>≡
    type, bind(C) :: c_prt_t
      integer(c_int) :: type = 0
      integer(c_int) :: pdg = 0
      integer(c_int) :: polarized = 0
      integer(c_int) :: h = 0
      real(c_double) :: pe = 0
      real(c_double) :: px = 0
      real(c_double) :: py = 0
      real(c_double) :: pz = 0
      real(c_double) :: p2 = 0
    end type c_prt_t

```

This is for debugging only, there is no C binding. It is a simplified version of `prt_write`.

```

  <C Particles: public>+≡
    public :: c_prt_write

  <C Particles: procedures>≡
    subroutine c_prt_write (prt, unit)
      type(c_prt_t), intent(in) :: prt
      integer, intent(in), optional :: unit
      integer :: u
      u = given_output_unit (unit);  if (u < 0)  return

```

```

write (u, "(1x,A)", advance="no") "prt("
write (u, "(I0,:')", advance="no") prt%type
if (prt%polarized /= 0) then
    write (u, "(I0,'/',I0,'|')", advance="no") prt%pdg, prt%h
else
    write (u, "(I0,'|')", advance="no") prt%pdg
end if
write (u, "(" // FMT_14 // ",;," // FMT_14 // ",,,," // &
        FMT_14 // ",,'," // FMT_14 // ")", advance="no") &
        prt%pe, prt%px, prt%py, prt%pz
write (u, "('|,'" // FMT_19 // ")", advance="no")  prt%p2
write (u, "(A)") ")"
end subroutine c_prt_write

```

## 9.3 Lorentz algebra

Define Lorentz vectors, three-vectors, boosts, and some functions to manipulate them.

To make maximum use of this, all functions, if possible, are declared elemental (or pure, if this is not possible).

```
<lorentz.f90>≡
  <File header>

  module lorentz

    <Use kinds with double>
    use io_units
    use constants, only: pi, twopi, degree, zero, one, eps0, tiny_07
    use format_defs, only: FMT_13, FMT_15, FMT_19
    use format_utils, only: pac_fmt
    use diagnostics
    use c_particles

    <Standard module head>

    <Lorentz: public>

      <Lorentz: public operators>

      <Lorentz: public functions>

      <Lorentz: types>

      <Lorentz: parameters>

      <Lorentz: interfaces>

      contains

        <Lorentz: procedures>
  end module lorentz
```

### 9.3.1 Three-vectors

First of all, let us introduce three-vectors in a trivial way. The functions and overloaded elementary operations clearly are too much overhead, but we like to keep the interface for three-vectors and four-vectors exactly parallel. By the way, we might attach a label to a vector by extending the type definition later.

```
<Lorentz: public>≡
  public :: vector3_t

<Lorentz: types>≡
  type :: vector3_t
    real(default), dimension(3) :: p
  end type vector3_t
```

```

Output a vector
⟨Lorentz: public⟩+≡
    public :: vector3_write
⟨Lorentz: procedures⟩≡
    subroutine vector3_write (p, unit, testflag)
        type(vector3_t), intent(in) :: p
        integer, intent(in), optional :: unit
        logical, intent(in), optional :: testflag
        character(len=7) :: fmt
        integer :: u
        u = given_output_unit (unit);  if (u < 0)  return
        call pac_fmt (fmt, FMT_19, FMT_15, testflag)
        write(u, "(1x,A,3(1x," // fmt // "))") 'P = ', p%p
    end subroutine vector3_write

```

This is a three-vector with zero components

```

⟨Lorentz: public⟩+≡
    public :: vector3_null
⟨Lorentz: parameters⟩≡
    type(vector3_t), parameter :: vector3_null = &
        vector3_t ([ zero, zero, zero ])

```

Canonical three-vector:

```

⟨Lorentz: public⟩+≡
    public :: vector3_canonical
⟨Lorentz: procedures⟩+≡
    elemental function vector3_canonical (k) result (p)
        type(vector3_t) :: p
        integer, intent(in) :: k
        p = vector3_null
        p%p(k) = 1
    end function vector3_canonical

```

A moving particle ( $k$ -axis, or arbitrary axis). Note that the function for the generic momentum cannot be elemental.

```

⟨Lorentz: public⟩+≡
    public :: vector3_moving
⟨Lorentz: interfaces⟩≡
    interface vector3_moving
        module procedure vector3_moving_canonical
        module procedure vector3_moving_generic
    end interface
⟨Lorentz: procedures⟩+≡
    elemental function vector3_moving_canonical (p, k) result(q)
        type(vector3_t) :: q
        real(default), intent(in) :: p
        integer, intent(in) :: k
        q = vector3_null
        q%p(k) = p

```

```

end function vector3_moving_canonical
pure function vector3_moving_generic (p) result(q)
    real(default), dimension(3), intent(in) :: p
    type(vector3_t) :: q
    q%p = p
end function vector3_moving_generic

```

Equality and inequality

```

⟨Lorentz: public operators⟩+≡
    public :: operator(==), operator(/=)

⟨Lorentz: interfaces⟩+≡
    interface operator(==)
        module procedure vector3_eq
    end interface
    interface operator(/=)
        module procedure vector3_neq
    end interface

⟨Lorentz: procedures⟩+≡
    elemental function vector3_eq (p, q) result (r)
        logical :: r
        type(vector3_t), intent(in) :: p,q
        r = all (abs (p%p - q%p) < eps0)
    end function vector3_eq
    elemental function vector3_neq (p, q) result (r)
        logical :: r
        type(vector3_t), intent(in) :: p,q
        r = any (abs(p%p - q%p) > eps0)
    end function vector3_neq

```

Define addition and subtraction

```

⟨Lorentz: public operators⟩+≡
    public :: operator(+), operator(-)

⟨Lorentz: interfaces⟩+≡
    interface operator(+)
        module procedure add_vector3
    end interface
    interface operator(-)
        module procedure sub_vector3
    end interface

⟨Lorentz: procedures⟩+≡
    elemental function add_vector3 (p, q) result (r)
        type(vector3_t) :: r
        type(vector3_t), intent(in) :: p,q
        r%p = p%p + q%p
    end function add_vector3
    elemental function sub_vector3 (p, q) result (r)
        type(vector3_t) :: r
        type(vector3_t), intent(in) :: p,q
        r%p = p%p - q%p
    end function sub_vector3

```

The multiplication sign is overloaded with scalar multiplication; similarly division:

```

⟨Lorentz: public operators⟩+≡
    public :: operator(*), operator(/)

⟨Lorentz: interfaces⟩+≡
    interface operator(*)
        module procedure prod_integer_vector3, prod_vector3_integer
        module procedure prod_real_vector3, prod_vector3_real
    end interface
    interface operator(/)
        module procedure div_vector3_real, div_vector3_integer
    end interface

⟨Lorentz: procedures⟩+≡
    elemental function prod_real_vector3 (s, p) result (q)
        type(vector3_t) :: q
        real(default), intent(in) :: s
        type(vector3_t), intent(in) :: p
        q%p = s * p%p
    end function prod_real_vector3
    elemental function prod_vector3_real (p, s) result (q)
        type(vector3_t) :: q
        real(default), intent(in) :: s
        type(vector3_t), intent(in) :: p
        q%p = s * p%p
    end function prod_vector3_real
    elemental function div_vector3_real (p, s) result (q)
        type(vector3_t) :: q
        real(default), intent(in) :: s
        type(vector3_t), intent(in) :: p
        q%p = p%p/s
    end function div_vector3_real
    elemental function prod_integer_vector3 (s, p) result (q)
        type(vector3_t) :: q
        integer, intent(in) :: s
        type(vector3_t), intent(in) :: p
        q%p = s * p%p
    end function prod_integer_vector3
    elemental function prod_vector3_integer (p, s) result (q)
        type(vector3_t) :: q
        integer, intent(in) :: s
        type(vector3_t), intent(in) :: p
        q%p = s * p%p
    end function prod_vector3_integer
    elemental function div_vector3_integer (p, s) result (q)
        type(vector3_t) :: q
        integer, intent(in) :: s
        type(vector3_t), intent(in) :: p
        q%p = p%p/s
    end function div_vector3_integer

```

The multiplication sign can also indicate scalar products:

```
⟨Lorentz: interfaces⟩+≡
```

```

interface operator(*)
    module procedure prod_vector3
end interface

⟨Lorentz: procedures⟩+≡
elemental function prod_vector3 (p, q) result (s)
    real(default) :: s
    type(vector3_t), intent(in) :: p,q
    s = dot_product (p%p, q%p)
end function prod_vector3

⟨Lorentz: public functions⟩≡
public :: cross_product

⟨Lorentz: interfaces⟩+≡
interface cross_product
    module procedure vector3_cross_product
end interface

⟨Lorentz: procedures⟩+≡
elemental function vector3_cross_product (p, q) result (r)
    type(vector3_t) :: r
    type(vector3_t), intent(in) :: p,q
    integer :: i
    do i=1,3
        r%p(i) = dot_product (p%p, matmul(epsilon_three(i,:,:), q%p))
    end do
end function vector3_cross_product

```

Exponentiation is defined only for integer powers. Odd powers mean take the square root; so  $p^{**1}$  is the length of  $p$ .

```

⟨Lorentz: public operators⟩+≡
public :: operator(**)

⟨Lorentz: interfaces⟩+≡
interface operator(**)
    module procedure power_vector3
end interface

⟨Lorentz: procedures⟩+≡
elemental function power_vector3 (p, e) result (s)
    real(default) :: s
    type(vector3_t), intent(in) :: p
    integer, intent(in) :: e
    s = dot_product (p%p, p%p)
    if (e/=2) then
        if (mod(e,2)==0) then
            s = s**(e/2)
        else
            s = sqrt(s)**e
        end if
    end if
end function power_vector3

```

Finally, we need a negation.

```
<Lorentz: interfaces>+≡
    interface operator(-)
        module procedure negate_vector3
    end interface

<Lorentz: procedures>+≡
    elemental function negate_vector3 (p) result (q)
        type(vector3_t) :: q
        type(vector3_t), intent(in) :: p
        integer :: i
        do i = 1, 3
            if (abs (p%p(i)) < eps0) then
                q%p(i) = 0
            else
                q%p(i) = -p%p(i)
            end if
        end do
    end function negate_vector3
```

The sum function can be useful:

```
<Lorentz: public functions>+≡
    public :: sum

<Lorentz: interfaces>+≡
    interface sum
        module procedure sum_vector3
    end interface

<Lorentz: public>+≡
    public :: vector3_set_component

<Lorentz: procedures>+≡
    subroutine vector3_set_component (p, i, value)
        type(vector3_t), intent(inout) :: p
        integer, intent(in) :: i
        real(default), intent(in) :: value
        p%p(i) = value
    end subroutine vector3_set_component

<Lorentz: procedures>+≡
    pure function sum_vector3 (p) result (q)
        type(vector3_t) :: q
        type(vector3_t), dimension(:), intent(in) :: p
        integer :: i
        do i=1, 3
            q%p(i) = sum (p%p(i))
        end do
    end function sum_vector3
```

Any component:

```
<Lorentz: public>+≡
    public :: vector3_get_component
```

```

⟨Lorentz: procedures⟩+≡
    elemental function vector3_get_component (p, k) result (c)
        type(vector3_t), intent(in) :: p
        integer, intent(in) :: k
        real(default) :: c
        c = p%p(k)
    end function vector3_get_component

```

Extract all components. This is not elemental.

```

⟨Lorentz: public⟩+≡
    public :: vector3_get_components

⟨Lorentz: procedures⟩+≡
    pure function vector3_get_components (p) result (a)
        type(vector3_t), intent(in) :: p
        real(default), dimension(3) :: a
        a = p%p
    end function vector3_get_components

```

This function returns the direction of a three-vector, i.e., a normalized three-vector. If the vector is null, we return a null vector.

```

⟨Lorentz: public functions⟩+≡
    public :: direction

⟨Lorentz: interfaces⟩+≡
    interface direction
        module procedure vector3_get_direction
    end interface

⟨Lorentz: procedures⟩+≡
    elemental function vector3_get_direction (p) result (q)
        type(vector3_t) :: q
        type(vector3_t), intent(in) :: p
        real(default) :: pp
        pp = p**1
        if (pp > eps0) then
            q%p = p%p / pp
        else
            q%p = 0
        end if
    end function vector3_get_direction

```

### 9.3.2 Four-vectors

In four-vectors the zero-component needs special treatment, therefore we do not use the standard operations. Sure, we pay for the extra layer of abstraction by losing efficiency; so we have to assume that the time-critical applications do not involve four-vector operations.

```

⟨Lorentz: public⟩+≡
    public :: vector4_t

```

```

⟨Lorentz: types⟩+≡
  type :: vector4_t
    real(default), dimension(0:3) :: p = &
      [zero, zero, zero, zero]
  contains
  ⟨Lorentz: vector4: TBP⟩
end type vector4_t

Output a vector
⟨Lorentz: public⟩+≡
  public :: vector4_write
⟨Lorentz: vector4: TBP⟩≡
  procedure :: write => vector4_write
⟨Lorentz: procedures⟩+≡
  subroutine vector4_write (p, unit, show_mass, testflag, compressed)
    class(vector4_t), intent(in) :: p
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: show_mass, testflag, compressed
    logical :: comp, sm
    integer :: u
    character(len=7) :: fmt
    comp = .false.; if (present(compressed)) comp = compressed
    sm = .false.; if (present(show_mass)) sm = show_mass
    call pac_fmt (fmt, FMT_19, FMT_13, testflag)
    u = given_output_unit (unit); if (u < 0) return
    if (comp) then
      write (u, "(4(F12.3,1X))", advance="no") p%p(0:3)
    else
      write(u, "(1x,A,1x," // fmt // ")") 'E = ', p%p(0)
      write(u, "(1x,A,3(1x," // fmt // "))") 'P = ', p%p(1:)
        if (sm) write (u, "(1x,A,1x," // fmt // "))") 'M = ', p**1
      end if
    end subroutine vector4_write

```

### Binary I/O

```

⟨Lorentz: public⟩+≡
  public :: vector4_write_raw
  public :: vector4_read_raw
⟨Lorentz: procedures⟩+≡
  subroutine vector4_write_raw (p, u)
    type(vector4_t), intent(in) :: p
    integer, intent(in) :: u
    write (u) p%p
  end subroutine vector4_write_raw

  subroutine vector4_read_raw (p, u, iostat)
    type(vector4_t), intent(out) :: p
    integer, intent(in) :: u
    integer, intent(out), optional :: iostat
    read (u, iostat=iostat) p%p
  end subroutine vector4_read_raw

```

This is a four-vector with zero components

```
<Lorentz: public>+≡
    public :: vector4_null
<Lorentz: parameters>+≡
    type(vector4_t), parameter :: vector4_null = &
        vector4_t ([ zero, zero, zero, zero ])
```

Canonical four-vector:

```
<Lorentz: public>+≡
    public :: vector4_canonical
<Lorentz: procedures>+≡
    elemental function vector4_canonical (k) result (p)
        type(vector4_t) :: p
        integer, intent(in) :: k
        p = vector4_null
        p%p(k) = 1
    end function vector4_canonical
```

A particle at rest:

```
<Lorentz: public>+≡
    public :: vector4_at_rest
<Lorentz: procedures>+≡
    elemental function vector4_at_rest (m) result (p)
        type(vector4_t) :: p
        real(default), intent(in) :: m
        p = vector4_t ([ m, zero, zero, zero ])
    end function vector4_at_rest
```

A moving particle ( $k$ -axis, or arbitrary axis)

```
<Lorentz: public>+≡
    public :: vector4_moving
<Lorentz: interfaces>+≡
    interface vector4_moving
        module procedure vector4_moving_canonical
        module procedure vector4_moving_generic
    end interface
<Lorentz: procedures>+≡
    elemental function vector4_moving_canonical (E, p, k) result (q)
        type(vector4_t) :: q
        real(default), intent(in) :: E, p
        integer, intent(in) :: k
        q = vector4_at_rest(E)
        q%p(k) = p
    end function vector4_moving_canonical
    elemental function vector4_moving_generic (E, p) result (q)
        type(vector4_t) :: q
        real(default), intent(in) :: E
        type(vector3_t), intent(in) :: p
        q%p(0) = E
```

```

q%p(1:) = p%p
end function vector4_moving_generic

```

Equality and inequality

```

<Lorentz: interfaces>+≡
    interface operator(==)
        module procedure vector4_eq
    end interface
    interface operator(/=)
        module procedure vector4_neq
    end interface

<Lorentz: procedures>+≡
    elemental function vector4_eq (p, q) result (r)
        logical :: r
        type(vector4_t), intent(in) :: p,q
        r = all (abs (p%p - q%p) < eps0)
    end function vector4_eq
    elemental function vector4_neq (p, q) result (r)
        logical :: r
        type(vector4_t), intent(in) :: p,q
        r = any (abs (p%p - q%p) > eps0)
    end function vector4_neq

```

Addition and subtraction:

```

<Lorentz: interfaces>+≡
    interface operator(+)
        module procedure add_vector4
    end interface
    interface operator(-)
        module procedure sub_vector4
    end interface

<Lorentz: procedures>+≡
    elemental function add_vector4 (p,q) result (r)
        type(vector4_t) :: r
        type(vector4_t), intent(in) :: p,q
        r%p = p%p + q%p
    end function add_vector4
    elemental function sub_vector4 (p,q) result (r)
        type(vector4_t) :: r
        type(vector4_t), intent(in) :: p,q
        r%p = p%p - q%p
    end function sub_vector4

```

We also need scalar multiplication and division:

```

<Lorentz: interfaces>+≡
    interface operator(*)
        module procedure prod_real_vector4, prod_vector4_real
        module procedure prod_integer_vector4, prod_vector4_integer
    end interface
    interface operator(/)
        module procedure div_vector4_real
    end interface

```

```

        module procedure div_vector4_integer
    end interface

<Lorentz: procedures>+≡
    elemental function prod_real_vector4 (s, p) result (q)
        type(vector4_t) :: q
        real(default), intent(in) :: s
        type(vector4_t), intent(in) :: p
        q%p = s * p%p
    end function prod_real_vector4
    elemental function prod_vector4_real (p, s) result (q)
        type(vector4_t) :: q
        real(default), intent(in) :: s
        type(vector4_t), intent(in) :: p
        q%p = s * p%p
    end function prod_vector4_real
    elemental function div_vector4_real (p, s) result (q)
        type(vector4_t) :: q
        real(default), intent(in) :: s
        type(vector4_t), intent(in) :: p
        q%p = p%p/s
    end function div_vector4_real
    elemental function prod_integer_vector4 (s, p) result (q)
        type(vector4_t) :: q
        integer, intent(in) :: s
        type(vector4_t), intent(in) :: p
        q%p = s * p%p
    end function prod_integer_vector4
    elemental function prod_vector4_integer (p, s) result (q)
        type(vector4_t) :: q
        integer, intent(in) :: s
        type(vector4_t), intent(in) :: p
        q%p = s * p%p
    end function prod_vector4_integer
    elemental function div_vector4_integer (p, s) result (q)
        type(vector4_t) :: q
        integer, intent(in) :: s
        type(vector4_t), intent(in) :: p
        q%p = p%p/s
    end function div_vector4_integer

```

Scalar products and squares in the Minkowski sense:

```

<Lorentz: interfaces>+≡
    interface operator(*)
        module procedure prod_vector4
    end interface
    interface operator(**)
        module procedure power_vector4
    end interface

<Lorentz: procedures>+≡
    elemental function prod_vector4 (p, q) result (s)
        real(default) :: s
        type(vector4_t), intent(in) :: p,q
        s = p%p(0)*q%p(0) - dot_product(p%p(1:), q%p(1:))

```

```
end function prod_vector4
```

The power operation for four-vectors is signed, i.e.,  $p^{**1}$  is positive for timelike and negative for spacelike vectors. Note that  $(p^{**1})^{**2}$  is not necessarily equal to  $p^{**2}$ .

```
Lorentz: procedures+≡
elemental function power_vector4 (p, e) result (s)
    real(default) :: s
    type(vector4_t), intent(in) :: p
    integer, intent(in) :: e
    s = p*p
    if (e/=2) then
        if (mod(e,2)==0) then
            s = s*(e/2)
        elseif (s>=0) then
            s = sqrt(s)**e
        else
            s = -(sqrt(abs(s))**e)
        end if
    end if
end function power_vector4
```

Finally, we introduce a negation

```
Lorentz: interfaces+≡
interface operator(-)
    module procedure negate_vector4
end interface

Lorentz: procedures+≡
elemental function negate_vector4 (p) result (q)
    type(vector4_t) :: q
    type(vector4_t), intent(in) :: p
    integer :: i
    do i = 0, 3
        if (abs (p%p(i)) < eps0) then
            q%p(i) = 0
        else
            q%p(i) = -p%p(i)
        end if
    end do
end function negate_vector4
```

The sum function can be useful:

```
Lorentz: interfaces+≡
interface sum
    module procedure sum_vector4, sum_vector4_mask
end interface

Lorentz: procedures+≡
pure function sum_vector4 (p) result (q)
    type(vector4_t) :: q
    type(vector4_t), dimension(:), intent(in) :: p
    integer :: i
```

```

do i = 0, 3
    q%p(i) = sum (p%p(i))
end do
end function sum_vector4

pure function sum_vector4_mask (p, mask) result (q)
    type(vector4_t) :: q
    type(vector4_t), dimension(:), intent(in) :: p
    logical, dimension(:), intent(in) :: mask
    integer :: i
do i = 0, 3
    q%p(i) = sum (p%p(i), mask=mask)
end do
end function sum_vector4_mask

```

### 9.3.3 Conversions

Manually set a component of the four-vector:

```

⟨Lorentz: public⟩+≡
public :: vector4_set_component

⟨Lorentz: procedures⟩+≡
subroutine vector4_set_component (p, k, c)
    type(vector4_t), intent(inout) :: p
    integer, intent(in) :: k
    real(default), intent(in) :: c
    p%p(k) = c
end subroutine vector4_set_component

```

Any component:

```

⟨Lorentz: public⟩+≡
public :: vector4_get_component

⟨Lorentz: procedures⟩+≡
elemental function vector4_get_component (p, k) result (c)
    real(default) :: c
    type(vector4_t), intent(in) :: p
    integer, intent(in) :: k
    c = p%p(k)
end function vector4_get_component

```

Extract all components. This is not elemental.

```

⟨Lorentz: public⟩+≡
public :: vector4_get_components

⟨Lorentz: procedures⟩+≡
pure function vector4_get_components (p) result (a)
    real(default), dimension(0:3) :: a
    type(vector4_t), intent(in) :: p
    a = p%p
end function vector4_get_components

```

This function returns the space part of a four-vector, such that we can apply three-vector operations on it:

```
(Lorentz: public functions)+≡
    public :: space_part

(Lorentz: interfaces)+≡
    interface space_part
        module procedure vector4_get_space_part
    end interface

(Lorentz: procedures)+≡
    elemental function vector4_get_space_part (p) result (q)
        type(vector3_t) :: q
        type(vector4_t), intent(in) :: p
        q%p = p%p(1:)
    end function vector4_get_space_part
```

This function returns the direction of a four-vector, i.e., a normalized three-vector. If the four-vector has zero space part, we return a null vector.

```
(Lorentz: interfaces)+≡
    interface direction
        module procedure vector4_get_direction
    end interface

(Lorentz: procedures)+≡
    elemental function vector4_get_direction (p) result (q)
        type(vector3_t) :: q
        type(vector4_t), intent(in) :: p
        real(default) :: qq
        q%p = p%p(1:)
        qq = q**1
        if (abs(qq) > eps0) then
            q%p = q%p / qq
        else
            q%p = 0
        end if
    end function vector4_get_direction
```

This function returns the four-vector as an ordinary array. A second version for an array of four-vectors.

```
(Lorentz: public)+≡
    public :: assignment (=)

(Lorentz: interfaces)+≡
    interface assignment (=)
        module procedure array_from_vector4_1, array_from_vector4_2, &
            array_from_vector3_1, array_from_vector3_2, &
            vector4_from_array, vector3_from_array
    end interface

(Lorentz: procedures)+≡
    pure subroutine array_from_vector4_1 (a, p)
        real(default), dimension(:), intent(out) :: a
        type(vector4_t), intent(in) :: p
        a = p%p
```

```

end subroutine array_from_vector4_1

pure subroutine array_from_vector4_2 (a, p)
  type(vector4_t), dimension(:, ), intent(in) :: p
  real(default), dimension(:, :, ), intent(out) :: a
  integer :: i
  forall (i=1:size(p))
    a(:,i) = p(i)%p
  end forall
end subroutine array_from_vector4_2

pure subroutine array_from_vector3_1 (a, p)
  real(default), dimension(:, ), intent(out) :: a
  type(vector3_t), intent(in) :: p
  a = p%p
end subroutine array_from_vector3_1

pure subroutine array_from_vector3_2 (a, p)
  type(vector3_t), dimension(:, ), intent(in) :: p
  real(default), dimension(:, :, ), intent(out) :: a
  integer :: i
  forall (i=1:size(p))
    a(:,i) = p(i)%p
  end forall
end subroutine array_from_vector3_2

pure subroutine vector4_from_array (p, a)
  type(vector4_t), intent(out) :: p
  real(default), dimension(:, ), intent(in) :: a
  p%p(0:3) = a
end subroutine vector4_from_array

pure subroutine vector3_from_array (p, a)
  type(vector3_t), intent(out) :: p
  real(default), dimension(:, ), intent(in) :: a
  p%p(1:3) = a
end subroutine vector3_from_array

⟨Lorentz: vector4: TBP⟩+≡
procedure :: to_pythia6 => vector4_to_pythia6
⟨Lorentz: procedures⟩+≡
pure function vector4_to_pythia6 (vector4, m) result (p)
  real(double), dimension(1:5) :: p
  class(vector4_t), intent(in) :: vector4
  real(default), intent(in), optional :: m
  p(1:3) = vector4%p(1:3)
  p(4) = vector4%p(0)
  if (present (m)) then
    p(5) = m
  else
    p(5) = vector4 ** 1
  end if
end function vector4_to_pythia6

```

Transform the momentum of a `c_prt` object into a four-vector and vice versa:

```
<Lorentz: interfaces>+≡
  interface assignment (=)
    module procedure vector4_from_c_prt, c_prt_from_vector4
  end interface

<Lorentz: procedures>+≡
  pure subroutine vector4_from_c_prt (p, c_prt)
    type(vector4_t), intent(out) :: p
    type(c_prt_t), intent(in) :: c_prt
    p%p(0) = c_prt%pe
    p%p(1) = c_prt%px
    p%p(2) = c_prt%py
    p%p(3) = c_prt%pz
  end subroutine vector4_from_c_prt

  pure subroutine c_prt_from_vector4 (c_prt, p)
    type(c_prt_t), intent(out) :: c_prt
    type(vector4_t), intent(in) :: p
    c_prt%pe = p%p(0)
    c_prt%px = p%p(1)
    c_prt%py = p%p(2)
    c_prt%pz = p%p(3)
    c_prt%p2 = p ** 2
  end subroutine c_prt_from_vector4
```

Initialize a `c_prt_t` object with the components of a four-vector as its kinematical entries. Compute the invariant mass, or use the optional mass-squared value instead.

```
<Lorentz: public>+≡
  public :: vector4_to_c_prt
<Lorentz: procedures>+≡
  elemental function vector4_to_c_prt (p, p2) result (c_prt)
    type(c_prt_t) :: c_prt
    type(vector4_t), intent(in) :: p
    real(default), intent(in), optional :: p2
    c_prt%pe = p%p(0)
    c_prt%px = p%p(1)
    c_prt%py = p%p(2)
    c_prt%pz = p%p(3)
    if (present (p2)) then
      c_prt%p2 = p2
    else
      c_prt%p2 = p ** 2
    end if
  end function vector4_to_c_prt
```

### 9.3.4 Angles

Return the angles in a canonical system. The angle  $\phi$  is defined between  $0 \leq \phi < 2\pi$ . In degenerate cases, return zero.

```

⟨Lorentz: public functions⟩+≡
  public :: azimuthal_angle

⟨Lorentz: interfaces⟩+≡
  interface azimuthal_angle
    module procedure vector3_azimuthal_angle
    module procedure vector4_azimuthal_angle
  end interface

⟨Lorentz: procedures⟩+≡
  elemental function vector3_azimuthal_angle (p) result (phi)
    real(default) :: phi
    type(vector3_t), intent(in) :: p
    if (any (abs (p%p(1:2)) > 0)) then
      phi = atan2(p%p(2), p%p(1))
      if (phi < 0) phi = phi + twopi
    else
      phi = 0
    end if
  end function vector3_azimuthal_angle
  elemental function vector4_azimuthal_angle (p) result (phi)
    real(default) :: phi
    type(vector4_t), intent(in) :: p
    phi = vector3_azimuthal_angle (space_part (p))
  end function vector4_azimuthal_angle

```

Azimuthal angle in degrees

```

⟨Lorentz: public functions⟩+≡
  public :: azimuthal_angle_deg

⟨Lorentz: interfaces⟩+≡
  interface azimuthal_angle_deg
    module procedure vector3_azimuthal_angle_deg
    module procedure vector4_azimuthal_angle_deg
  end interface

⟨Lorentz: procedures⟩+≡
  elemental function vector3_azimuthal_angle_deg (p) result (phi)
    real(default) :: phi
    type(vector3_t), intent(in) :: p
    phi = vector3_azimuthal_angle (p) / degree
  end function vector3_azimuthal_angle_deg
  elemental function vector4_azimuthal_angle_deg (p) result (phi)
    real(default) :: phi
    type(vector4_t), intent(in) :: p
    phi = vector4_azimuthal_angle (p) / degree
  end function vector4_azimuthal_angle_deg

```

The azimuthal distance of two vectors. This is the difference of the azimuthal angles, but cannot be larger than  $\pi$ : The result is between  $-\pi < \Delta\phi \leq \pi$ .

```

⟨Lorentz: public functions⟩+≡
  public :: azimuthal_distance

⟨Lorentz: interfaces⟩+≡
  interface azimuthal_distance

```

```

    module procedure vector3_azimuthal_distance
    module procedure vector4_azimuthal_distance
end interface

⟨Lorentz: procedures⟩+≡
  elemental function vector3_azimuthal_distance (p, q) result (dphi)
    real(default) :: dphi
    type(vector3_t), intent(in) :: p,q
    dphi = vector3_azimuthal_angle (q) - vector3_azimuthal_angle (p)
    if (dphi <= -pi) then
      dphi = dphi + twopi
    else if (dphi > pi) then
      dphi = dphi - twopi
    end if
  end function vector3_azimuthal_distance
  elemental function vector4_azimuthal_distance (p, q) result (dphi)
    real(default) :: dphi
    type(vector4_t), intent(in) :: p,q
    dphi = vector3_azimuthal_distance &
           (space_part (p), space_part (q))
  end function vector4_azimuthal_distance

```

The same in degrees:

```

⟨Lorentz: public functions⟩+≡
  public :: azimuthal_distance_deg
⟨Lorentz: interfaces⟩+≡
  interface azimuthal_distance_deg
    module procedure vector3_azimuthal_distance_deg
    module procedure vector4_azimuthal_distance_deg
  end interface

        p = p/abs
    end subroutine normalize

```

### 9.3.9 Boosts

We build Lorentz transformations from boosts and rotations. In both cases we can supply a three-vector which defines the axis and (hyperbolic) angle. For a boost, this is the vector  $\vec{\beta} = \vec{p}/E$ , such that a particle at rest with mass  $m$  is boosted to a particle with three-vector  $\vec{p}$ . Here, we have

$$\beta = \tanh \chi = p/E, \quad \gamma = \cosh \chi = E/m, \quad \beta\gamma = \sinh \chi = p/m \quad (9.1)$$

```

⟨Lorentz: public functions⟩+≡
    public :: boost

```

```

⟨Lorentz: interfaces⟩+≡
  interface boost
    module procedure boost_from_rest_frame
    module procedure boost_from_rest_frame_vector3
    module procedure boost_generic
    module procedure boost_canonical
  end interface

In the first form, the argument is some four-momentum, the space part of which
determines a direction, and the associated mass (which is not checked against
the four-momentum). The boost vector  $\gamma\vec{\beta}$  is then given by  $\vec{p}/m$ . This boosts
from the rest frame of a particle to the current frame. To be explicit, if  $\vec{p}$  is
the momentum of a particle and  $m$  its mass,  $L(\vec{p}/m)$  is the transformation that
turns  $(m; \vec{0})$  into  $(E; \vec{p})$ . Conversely, the inverse transformation boosts a vector
into the rest frame of a particle, in particular  $(E; \vec{p})$  into  $(m; \vec{0})$ .
  ⟨Lorentz: procedures⟩+≡
    elemental function boost_from_rest_frame (p, m) result (L)
      type(lorentz_transformation_t) :: L
      type(vector4_t), intent(in) :: p
      real(default), intent(in) :: m
      L = boost_from_rest_frame_vector3 (space_part (p), m)
    end function boost_from_rest_frame
    elemental function boost_from_rest_frame_vector3 (p, m) result (L)
      type(lorentz_transformation_t) :: L
      type(vector3_t), intent(in) :: p
      real(default), intent(in) :: m
      type(vector3_t) :: beta_gamma
      real(default) :: bg2, g, c
      integer :: i, j
      if (m > eps0) then
        beta_gamma = p / m
        bg2 = beta_gamma**2
      else
        bg2 = 0
      end if
      if (bg2 > eps0) then
        g = sqrt(1 + bg2); c = (g-1)/bg2
        L%L(0,0) = g
        L%L(0,1:) = beta_gamma%p
        L%L(1:,0) = L%L(0,1:)
        do i=1,3
          do j=1,3
            L%L(i,j) = delta_three(i,j) + c*beta_gamma%p(i)*beta_gamma%p(j)
          end do
        end do
      else
        L = identity
      end if
    end function boost_from_rest_frame_vector3

```

A canonical boost is a boost along one of the coordinate axes, which we may supply as an integer argument. Here,  $\gamma\beta$  is scalar.

```

  ⟨Lorentz: procedures⟩+≡
    elemental function boost_canonical (beta_gamma, k) result (L)

```

```

type(lorentz_transformation_t) :: L
real(default), intent(in) :: beta_gamma
integer, intent(in) :: k
real(default) :: g
g = sqrt(1 + beta_gamma**2)
L = identity
L%L(0,0) = g
L%L(0,k) = beta_gamma
L%L(k,0) = L%L(0,k)
L%L(k,k) = L%L(0,0)
end function boost_canonical

```

Instead of a canonical axis, we can supply an arbitrary axis which need not be normalized. If it is zero, return the unit matrix.

```

<Lorentz: procedures>+≡
elemental function boost_generic (beta_gamma, axis) result (L)
type(lorentz_transformation_t) :: L
real(default), intent(in) :: beta_gamma
type(vector3_t), intent(in) :: axis
if (any (abs (axis%p) > 0)) then
    L = boost_from_rest_frame_vector3 (beta_gamma * axis, axis**1)
else
    L = identity
end if
end function boost_generic

```

### 9.3.10 Rotations

For a rotation, the vector defines the rotation axis, and its length the rotation angle.

```

<Lorentz: public functions>+≡
public :: rotation
<Lorentz: interfaces>+≡
interface rotation
    module procedure rotation_generic
    module procedure rotation_canonical
    module procedure rotation_generic_cs
    module procedure rotation_canonical_cs
end interface

```

If  $\cos \phi$  and  $\sin \phi$  is already known, we do not have to calculate them. Of course, the user has to ensure that  $\cos^2 \phi + \sin^2 \phi = 1$ , and that the given axis  $n$  is normalized to one. In the second form, the length of `axis` is the rotation angle.

```

<Lorentz: procedures>+≡
elemental function rotation_generic_cs (cp, sp, axis) result (R)
type(lorentz_transformation_t) :: R
real(default), intent(in) :: cp, sp
type(vector3_t), intent(in) :: axis
integer :: i,j
R = identity
do i=1,3

```

```

do j=1,3
    R%L(i,j) = cp*delta_three(i,j) + (1-cp)*axis%p(i)*axis%p(j)  &
        & - sp*dot_product(epsilon_three(i,j,:), axis%p)
end do
end do
end function rotation_generic_cs
elemental function rotation_generic (axis) result (R)
    type(lorentz_transformation_t) :: R
    type(vector3_t), intent(in) :: axis
    real(default) :: phi
    if (any (abs(axis%p) > 0)) then
        phi = abs(axis**1)
        R = rotation_generic_cs (cos(phi), sin(phi), axis/phi)
    else
        R = identity
    end if
end function rotation_generic

```

Alternatively, give just the angle and label the coordinate axis by an integer.

```

<Lorentz: procedures>+≡
    elemental function rotation_canonical_cs (cp, sp, k) result (R)
        type(lorentz_transformation_t) :: R
        real(default), intent(in) :: cp, sp
        integer, intent(in) :: k
        integer :: i,j
        R = identity
        do i=1,3
            do j=1,3
                R%L(i,j) = -sp*epsilon_three(i,j,k)
            end do
            R%L(i,i) = cp
        end do
        R%L(k,k) = 1
    end function rotation_canonical_cs
    elemental function rotation_canonical (phi, k) result (R)
        type(lorentz_transformation_t) :: R
        real(default), intent(in) :: phi
        integer, intent(in) :: k
        R = rotation_canonical_cs(cos(phi), sin(phi), k)
    end function rotation_canonical

```

This is viewed as a method for the first argument (three-vector): Reconstruct the rotation that rotates it into the second three-vector.

```

<Lorentz: public functions>+≡
    public :: rotation_to_2nd
<Lorentz: interfaces>+≡
    interface rotation_to_2nd
        module procedure rotation_to_2nd_generic
        module procedure rotation_to_2nd_canonical
    end interface
<Lorentz: procedures>+≡
    elemental function rotation_to_2nd_generic (p, q) result (R)
        type(lorentz_transformation_t) :: R
        type(vector3_t), intent(in) :: p, q

```

```

type(vector3_t) :: a, b, ab
real(default) :: ct, st
if (any (abs (p%p) > 0) .and. any (abs (q%p) > 0)) then
    a = direction (p)
    b = direction (q)
    ab = cross_product(a,b)
    ct = a*b; st = ab**1
    if (abs(st) > eps0) then
        R = rotation_generic_cs (ct, st, ab/st)
    else if (ct < 0) then
        R = space_reflection
    else
        R = identity
    end if
else
    R = identity
end if
end function rotation_to_2nd_generic

```

The same for a canonical axis: The function returns the transformation that rotates the  $k$ -axis into the direction of  $p$ .

```

<Lorentz: procedures>+≡
elemental function rotation_to_2nd_canonical (k, p) result (R)
type(lorentz_transformation_t) :: R
integer, intent(in) :: k
type(vector3_t), intent(in) :: p
type(vector3_t) :: b, ab
real(default) :: ct, st
integer :: i, j
if (any (abs (p%p) > 0)) then
    b = direction (p)
    ab%p = 0
    do i = 1, 3
        do j = 1, 3
            ab%p(j) = ab%p(j) + b%p(i) * epsilon_three(i,j,k)
        end do
    end do
    ct = b%p(k); st = ab**1
    if (abs(st) > eps0) then
        R = rotation_generic_cs (ct, st, ab/st)
    else if (ct < 0) then
        R = space_reflection
    else
        R = identity
    end if
else
    R = identity
end if
end function rotation_to_2nd_canonical

```

### 9.3.11 Composite Lorentz transformations

This function returns the transformation that, given a pair of vectors  $p_{1,2}$ , (a) boosts from the rest frame of the c.m. system (with invariant mass  $m$ ) into the lab frame where  $p_i$  are defined, and (b) turns the given axis (or the canonical vectors  $\pm e_k$ ) in the rest frame into the directions of  $p_{1,2}$  in the lab frame. Note that the energy components are not used; for a consistent result one should have  $(p_1 + p_2)^2 = m^2$ .

```
<Lorentz: public functions>+≡
    public :: transformation
<Lorentz: interfaces>+≡
    interface transformation
        module procedure transformation_rec_generic
        module procedure transformation_rec_canonical
    end interface
<Lorentz: procedures>+≡
    elemental function transformation_rec_generic (axis, p1, p2, m) result (L)
        type(vector3_t), intent(in) :: axis
        type(vector4_t), intent(in) :: p1, p2
        real(default), intent(in) :: m
        type(lorentz_transformation_t) :: L
        L = boost (p1 + p2, m)
        L = L * rotation_to_2nd (axis, space_part (inverse (L) * p1))
    end function transformation_rec_generic
    elemental function transformation_rec_canonical (k, p1, p2, m) result (L)
        integer, intent(in) :: k
        type(vector4_t), intent(in) :: p1, p2
        real(default), intent(in) :: m
        type(lorentz_transformation_t) :: L
        L = boost (p1 + p2, m)
        L = L * rotation_to_2nd (k, space_part (inverse (L) * p1))
    end function transformation_rec_canonical
```

### 9.3.12 Applying Lorentz transformations

Multiplying vectors and Lorentz transformations is straightforward.

```
<Lorentz: interfaces>+≡
    interface operator(*)
        module procedure prod_LT_vector4
        module procedure prod_LT_LT
        module procedure prod_vector4_LT
    end interface
<Lorentz: procedures>+≡
    elemental function prod_LT_vector4 (L, p) result (np)
        type(vector4_t) :: np
        type(lorentz_transformation_t), intent(in) :: L
        type(vector4_t), intent(in) :: p
        np%p = matmul (L%L, p%p)
    end function prod_LT_vector4
    elemental function prod_LT_LT (L1, L2) result (NL)
        type(lorentz_transformation_t) :: NL
        type(lorentz_transformation_t), intent(in) :: L1,L2
```

```

NL%L = matmul (L1%L, L2%L)
end function prod_LT_LT
elemental function prod_vector4_LT (p, L) result (np)
    type(vector4_t) :: np
    type(vector4_t), intent(in) :: p
    type(lorentz_transformation_t), intent(in) :: L
    np%p = matmul (p%p, L%L)
end function prod_vector4_LT

```

### 9.3.13 Special Lorentz transformations

These routines have their application in the generation and extraction of angles in the phase-space sampling routine. Since this part of the program is time-critical, we calculate the composition of transformations directly instead of multiplying rotations and boosts.

This Lorentz transformation is the composition of a rotation by  $\phi$  around the 3 axis, a rotation by  $\theta$  around the 2 axis, and a boost along the 3 axis:

$$L = B_3(\beta\gamma) R_2(\theta) R_3(\phi) \quad (9.2)$$

Instead of the angles we provide sine and cosine.

```

<Lorentz: public functions>+≡
public :: LT_compose_r3_r2_b3

<Lorentz: procedures>+≡
elemental function LT_compose_r3_r2_b3 &
    (cp, sp, ct, st, beta_gamma) result (L)
    type(lorentz_transformation_t) :: L
    real(default), intent(in) :: cp, sp, ct, st, beta_gamma
    real(default) :: gamma
    if (abs(beta_gamma) < eps0) then
        L%L(0,0) = 1
        L%L(1:,0) = 0
        L%L(0,1:) = 0
        L%L(1,1:) = [ ct*cp, -ct*sp, st ]
        L%L(2,1:) = [ sp, cp, zero ]
        L%L(3,1:) = [ -st*cp, st*sp, ct ]
    else
        gamma = sqrt(1 + beta_gamma**2)
        L%L(0,0) = gamma
        L%L(1,0) = 0
        L%L(2,0) = 0
        L%L(3,0) = beta_gamma
        L%L(0,1:) = beta_gamma * [ -st*cp, st*sp, ct ]
        L%L(1,1:) = [ ct*cp, -ct*sp, st ]
        L%L(2,1:) = [ sp, cp, zero ]
        L%L(3,1:) = gamma * [ -st*cp, st*sp, ct ]
    end if
end function LT_compose_r3_r2_b3

```

Different ordering:

$$L = B_3(\beta\gamma) R_3(\phi) R_2(\theta) \quad (9.3)$$

```

⟨Lorentz: public functions⟩+≡
public :: LT_compose_r2_r3_b3

⟨Lorentz: procedures⟩+≡
elemental function LT_compose_r2_r3_b3 &
    (ct, st, cp, sp, beta_gamma) result (L)
    type(lorentz_transformation_t) :: L
    real(default), intent(in) :: ct, st, cp, sp, beta_gamma
    real(default) :: gamma
    if (abs(beta_gamma) < eps0) then
        L%L(0,0) = 1
        L%L(1:,0) = 0
        L%L(0,1:) = 0
        L%L(1,1:) = [ ct*cp, -sp, st*cp ]
        L%L(2,1:) = [ ct*sp, cp, st*sp ]
        L%L(3,1:) = [ -st, zero, ct ]
    else
        gamma = sqrt(1 + beta_gamma**2)
        L%L(0,0) = gamma
        L%L(1,0) = 0
        L%L(2,0) = 0
        L%L(3,0) = beta_gamma
        L%L(0,1:) = beta_gamma * [ -st, zero, ct ]
        L%L(1,1:) = [ ct*cp, -sp, st*cp ]
        L%L(2,1:) = [ ct*sp, cp, st*sp ]
        L%L(3,1:) = gamma * [ -st, zero, ct ]
    end if
end function LT_compose_r2_r3_b3

```

This function returns the previous Lorentz transformation applied to an arbitrary four-momentum and extracts the space part of the result:

$$\vec{n} = [B_3(\beta\gamma) R_2(\theta) R_3(\phi) p]_{\text{space part}} \quad (9.4)$$

The second variant applies if there is no rotation

```

⟨Lorentz: public functions⟩+≡
public :: axis_from_p_r3_r2_b3, axis_from_p_b3

⟨Lorentz: procedures⟩+≡
elemental function axis_from_p_r3_r2_b3 &
    (p, cp, sp, ct, st, beta_gamma) result (n)
    type(vector3_t) :: n
    type(vector4_t), intent(in) :: p
    real(default), intent(in) :: cp, sp, ct, st, beta_gamma
    real(default) :: gamma, px, py
    px = cp * p%p(1) - sp * p%p(2)
    py = sp * p%p(1) + cp * p%p(2)
    n%p(1) = ct * px + st * p%p(3)
    n%p(2) = py
    n%p(3) = -st * px + ct * p%p(3)
    if (abs(beta_gamma) > eps0) then
        gamma = sqrt(1 + beta_gamma**2)
    end if
end function axis_from_p_r3_r2_b3

```

```

        n%p(3) = n%p(3) * gamma + p%p(0) * beta_gamma
    end if
end function axis_from_p_r3_r2_b3

elemental function axis_from_p_b3 (p, beta_gamma) result (n)
    type(vector3_t) :: n
    type(vector4_t), intent(in) :: p
    real(default), intent(in) :: beta_gamma
    real(default) :: gamma
    n%p = p%p(1:3)
    if (abs(beta_gamma) > eps0) then
        gamma = sqrt(1 + beta_gamma**2)
        n%p(3) = n%p(3) * gamma + p%p(0) * beta_gamma
    end if
end function axis_from_p_b3

```

### 9.3.14 Special functions

The standard phase space function:

```

⟨Lorentz: public functions⟩+≡
public :: lambda
⟨Lorentz: procedures⟩+≡
elemental function lambda (m1sq, m2sq, m3sq)
    real(default) :: lambda
    real(default), intent(in) :: m1sq, m2sq, m3sq
    lambda = (m1sq - m2sq - m3sq)**2 - 4*m2sq*m3sq
end function lambda

```

Return a pair of head-to-head colliding momenta, given the collider energy, particle masses, and optionally the momentum of the c.m. system.

```

⟨Lorentz: public functions⟩+≡
public :: colliding_momenta
⟨Lorentz: procedures⟩+≡
function colliding_momenta (sqrt, m, p_cm) result (p)
    type(vector4_t), dimension(2) :: p
    real(default), intent(in) :: sqrt
    real(default), dimension(2), intent(in), optional :: m
    real(default), intent(in), optional :: p_cm
    real(default), dimension(2) :: dmsq

```

This subroutine is for the purpose of numerical checks and comparisons. The idea is to set a number to zero if it is numerically equivalent with zero. The equivalence is established by comparing with a tolerance argument. We implement this for vectors and transformations.

end subroutine vector4_write_set

```

This computes the quantities

$$\langle ij \rangle = \sqrt{|S_{ij}|} e^{i\phi_{ij}}, [ij] = \sqrt{|S_{ij}|} e^{i\tilde{\phi}_{ij}},$$

with  $S_{ij} = (p_i + p_j)^2$ . The phase space factor  $\phi_{ij}$  is determined by

$$\cos \phi_{ij} = \frac{p_i^1 p_j^+ - p_j^1 p_i^+}{\sqrt{p_i^+ p_j^+ S_{ij}}}, \sin \phi_{ij} = \frac{p_i^2 p_j^+ - p_j^2 p_i^+}{\sqrt{p_i^+ p_j^+ S_{ij}}}.$$

After  $\langle ij \rangle$  has been computed according to these formulae,  $[ij]$  can be obtained by using the relation  $S_{ij} = \langle ij \rangle [ji]$  and taking into account that  $[ij] = -[ji]$ . Thus, a minus-sign has to be applied.

## 9.4 Special Physics functions

Here, we declare functions that are specific for the Standard Model, including QCD: fixed and running  $\alpha_s$ , Catani-Seymour dipole terms, loop functions, etc.

To make maximum use of this, all functions, if possible, are declared elemental (or pure, if this is not possible).

`<sm_physics.f90>≡  
<File header>`

```
module sm_physics

<Use kinds>
  use io_units
  use constants
  use unit_tests
  use diagnostics
  use physics_defs
  use lorentz

<Standard module head>

<SM physics: public>

<SM physics: parameters>

contains

<SM physics: procedures>

end module sm_physics
```

### 9.4.1 Running $\alpha_s$

Then we define the coefficients of the beta function of QCD (as a reference cf. the Particle Data Group), where  $n_f$  is the number of active flavors in two different schemes:

$$\beta_0 = 11 - \frac{2}{3}n_f \quad (9.5)$$

$$\beta_1 = 51 - \frac{19}{3}n_f \quad (9.6)$$

$$\beta_2 = 2857 - \frac{5033}{9}n_f + \frac{325}{27}n_f^2 \quad (9.7)$$

$$b_0 = \frac{1}{12\pi} (11C_A - 2n_f) \quad (9.8)$$

$$b_1 = \frac{1}{24\pi^2} (17C_A^2 - 5C_A n_f - 3C_F n_f) \quad (9.9)$$

$$b_2 = \frac{1}{(4\pi)^3} \left( \frac{2857}{54} C_A^3 - \frac{1415}{54} * C_A^2 n_f - \frac{205}{18} C_A C_F n_f + C_F^2 n_f + \frac{79}{54} C_A n_f * * 2 + \frac{11}{9} C_F n_f * * 2 \right) \quad (9.10)$$

```

#### 9.4.2 Catani-Seymour Parameters

These are fundamental constants of the Catani-Seymour dipole formalism. Since the corresponding parameters for the gluon case depend on the number of flavors which is treated as an argument, there we do have functions and not parameters.

$$\gamma_q = \gamma_{\bar{q}} = \frac{3}{2} C_F \quad \gamma_g = \frac{11}{6} C_A - \frac{2}{3} T_R N_f \quad (9.11)$$

$$K_q = K_{\bar{q}} = \left( \frac{7}{2} - \frac{\pi^2}{6} \right) C_F \quad K_g = \left( \frac{67}{18} - \frac{\pi^2}{6} \right) C_A - \frac{10}{9} T_R N_f \quad (9.12)$$

```

end function k_g

```

### 9.4.3 Mathematical Functions

The dilogarithm. This simplified version is bound to double precision, and restricted to argument values less or equal to unity, so we do not need complex algebra. The wrapper converts it to default precision (which is, of course, a no-op if double=default).

The routine calculates the dilogarithm through mapping on the area where there is a quickly convergent series (adapted from an F77 routine by Hans Kuijf, 1988): Map  $x$  such that  $x$  is not in the neighbourhood of 1. Note that  $|z| = -\ln(1-x)$  is always smaller than 1.10, but  $\frac{1.10^{19}}{19!} \text{Bernoulli}_{19} = 2.7 \times 10^{-15}$ .

```

#### 9.4.6 Functions for Catani-Seymour dipoles

For the automated Catani-Seymour dipole subtraction, we need the following functions.

```

⟨SM physics: public⟩+≡
  public :: ff_dipole

⟨SM physics: procedures⟩+≡
  pure subroutine ff_dipole (v_ijk,y_ijk,p_ij,pp_k,p_i,p_j,p_k)
    type(vector4_t), intent(in) :: p_i, p_j, p_k
    type(vector4_t), intent(out) :: p_ij, pp_k
    real(kind=default), intent(out) :: y_ijk
    real(kind=default) :: z_i
    real(kind=default), intent(out) :: v_ijk
    z_i = (p_i*p_k) / ((p_k*p_j) + (p_k*p_i))
    y_ijk = (p_i*p_j) / ((p_i*p_j) + (p_i*p_k) + (p_j*p_k))
    p_ij = p_i + p_j - y_ijk/(1.0_default - y_ijk) * p_k
    pp_k = (1.0/(1.0_default - y_ijk)) * p_k
    !!! We don't multiply by alpha_s right here:
    v_ijk = 8.0_default * PI * CF * &
            (2.0 / (1.0 - z_i*(1.0 - y_ijk)) - (1.0 + z_i))
  end subroutine ff_dipole

```

```

⟨SM physics: public⟩+≡
  public :: fi_dipole

⟨SM physics: procedures⟩+≡
  pure subroutine fi_dipole (v_ija,x_ija,p_ij,pp_a,p_i,p_j,p_a)
    type(vector4_t), intent(in) :: p_i, p_j, p_a
    type(vector4_t), intent(out) :: p_ij, pp_a
    real(kind=default), intent(out) :: x_ija
    real(kind=default) :: z_i
    real(kind=default), intent(out) :: v_ija
    z_i = (p_i*p_a) / ((p_a*p_j) + (p_a*p_i))
    x_ija = ((p_i*p_a) + (p_j*p_a) - (p_i*p_j)) &

```

```

    / ((p_i*p_a) + (p_j*p_a))
p_ij = p_i + p_j - (1.0_default - x_ij) * p_a
pp_a = x_ij * p_a
!!! We don't not multiply by alpha_s right here:
v_ij = 8.0_default * PI * CF * &
       (2.0 / (1.0 - z_i + (1.0 - x_ij)) - (1.0 + z_i)) / x_ij
end subroutine fi_dipole

```

```

⟨SM physics: public⟩+≡
public :: if_dipole
⟨SM physics: procedures⟩+≡
pure subroutine if_dipole (v_kja,u_j,p_aj,pp_k,p_k,p_j,p_a)
    type(vector4_t), intent(in) :: p_k, p_j, p_a
    type(vector4_t), intent(out) :: p_aj, pp_k
    real(kind=default), intent(out) :: u_j
    real(kind=default) :: x_kja
    real(kind=default), intent(out) :: v_kja
    u_j = (p_a*p_j) / ((p_a*p_j) + (p_a*p_k))
    x_kja = ((p_a*p_k) + (p_a*p_j) - (p_j*p_k)) &
           / ((p_a*p_j) + (p_a*p_k))
    p_aj = x_kja * p_a
    pp_k = p_k + p_j - (1.0_default - x_kja) * p_a
    v_kja = 8.0_default * PI * CF * &
           (2.0 / (1.0 - x_kja + u_j) - (1.0 + x_kja)) / x_kja
end subroutine if_dipole

```

This function depends on a variable number of final state particles whose kinematics all get changed by the initial-initial dipole insertion.

```

⟨SM physics: public⟩+≡
public :: ii_dipole
⟨SM physics: procedures⟩+≡
pure subroutine ii_dipole (v_jab,v_j,p_in,p_out,flag_1or2)
    type(vector4_t), dimension(:), intent(in) :: p_in
    type(vector4_t), dimension(size(p_in)-1), intent(out) :: p_out
    logical, intent(in) :: flag_1or2
    real(kind=default), intent(out) :: v_j
    real(kind=default), intent(out) :: v_jab
    type(vector4_t) :: p_a, p_b, p_j
    type(vector4_t) :: k, kk
    type(vector4_t) :: p_aj
    real(kind=default) :: x_jab
    integer :: i
    !!! flag_1or2 decides whether this a 12 or 21 dipole
    if (flag_1or2) then
        p_a = p_in(1)
        p_b = p_in(2)
    else
        p_b = p_in(1)
        p_a = p_in(2)
    end if
    !!! We assume that the unresolved particle has always the last
    !!! momentum

```

```

p_j = p_in(size(p_in))
x_jab = ((p_a*p_b) - (p_a*p_j) - (p_b*p_j)) / (p_a*p_b)
v_j = (p_a*p_j) / (p_a * p_b)
p_aj = x_jab * p_a
k = p_a + p_b - p_j
kk = p_aj + p_b
do i = 3, size(p_in)-1
    p_out(i) = p_in(i) - 2.0*((k+kk)*p_in(i))/((k+kk)*(k+kk)) * (k+kk) + &
                (2.0 * (k*p_in(i)) / (k*k)) * kk
end do
if (flag_1or2) then
    p_out(1) = p_aj
    p_out(2) = p_b
else
    p_out(1) = p_b
    p_out(2) = p_aj
end if
v_jab = 8.0_default * PI * CF * &
        (2.0 / (1.0 - x_jab) - (1.0 + x_jab)) / x_jab
end subroutine ii_dipole

```

#### 9.4.7 Distributions for integrated dipoles and such

Note that the following formulae are only meaningful for  $0 \leq x \leq 1$ .

The Dirac delta distribution, modified for Monte-Carlo sampling, centered at  $x = 1 - \frac{\epsilon}{2}$ :

```

⟨SM physics: public⟩+≡
public :: delta

⟨SM physics: procedures⟩+≡
elemental function delta (x,eps) result (z)
    real(kind=default), intent(in) :: x, eps
    real(kind=default) :: z
    if (x > one - eps) then
        z = one / eps
    else
        z = 0
    end if
end function delta

```

The +-distribution,  $P_+(x) = \left(\frac{1}{1-x}\right)_+$ , for the regularization of soft-collinear singularities. The constant part for the Monte-Carlo sampling is the integral over the splitting function divided by the weight for the WHIZARD numerical integration over the interval.

```

⟨SM physics: public⟩+≡
public :: plus_distr

⟨SM physics: procedures⟩+≡
elemental function plus_distr (x,eps) result (plusd)
    real(kind=default), intent(in) :: x, eps
    real(kind=default) :: plusd
    if (x > one - eps) then
        plusd = log(eps) / eps
    end if
end function plus_distr

```

```

    else
        plusd = one / (one - x)
    end if
end function plus_distr

```

The splitting function in  $D = 4$  dimensions, regularized as +-distributions if necessary:

$$P^{qq}(x) = P^{\bar{q}\bar{q}}(x) = C_F \cdot \left( \frac{1+x^2}{1-x} \right)_+ \quad (9.13)$$

$$P^{qg}(x) = P^{\bar{q}g}(x) = C_F \cdot \frac{1+(1-x)^2}{x} \quad (9.14)$$

$$P^{gq}(x) = P^{g\bar{q}}(x) = T_R \cdot [x^2 + (1-x)^2] \quad (9.15)$$

$$\begin{aligned} P^{gg}(x) = & 2C_A \left[ \left( \frac{1}{1-x} \right)_+ + \frac{1-x}{x} - 1 + x(1-x) \right] \\ & + \delta(1-x) \left( \frac{11}{6}C_A - \frac{2}{3}N_fT_R \right) \end{aligned} \quad (9.16)$$

Since the number of flavors summed over in the gluon splitting function might depend on the physics case under consideration, it is implemented as an input variable.

```

⟨SM physics: public⟩+≡
public :: pqq

⟨SM physics: procedures⟩+≡
elemental function pqq (x,eps) result (pqqx)
    real(kind=default), intent(in) :: x, eps
    real(kind=default) :: pqqx
    if (x > (1.0_default - eps)) then
        pqqx = (eps - one) / two + two * log(eps) / eps - &
            three * (eps - one) / eps / two
    else
        pqqx = (one + x**2) / (one - x)
    end if
    pqqx = CF * pqqx
end function pqq

⟨SM physics: public⟩+≡
public :: pgq

⟨SM physics: procedures⟩+≡
elemental function pgq (x) result (pgqx)
    real(kind=default), intent(in) :: x
    real(kind=default) :: pgqx
    pgqx = TR * (x**2 + (one - x)**2)
end function pgq

⟨SM physics: public⟩+≡
public :: pfg

```

```

⟨SM physics: procedures⟩+≡
  elemental function pqg (x) result (pqgx)
    real(kind=default), intent(in) :: x
    real(kind=default) :: pqgx
    pqgx = CF * (one + (one - x)**2) / x
  end function pqg

⟨SM physics: public⟩+≡
  public :: pgg

⟨SM physics: procedures⟩+≡
  elemental function pgg (x, nf, eps) result (pggx)
    real(kind=default), intent(in) :: x, nf, eps
    real(kind=default) :: pggx
    pggx = two * CA * ( plus_distr (x, eps) + (one-x)/x - one + &
                         x*(one-x)) + delta (x, eps) * gamma_g(nf)
  end function pgg

```

For the  $qq$  and  $gg$  cases, there exist “regularized” versions of the splitting functions:

$$P_{\text{reg}}^{qq}(x) = -C_F \cdot (1 + x) \quad (9.17)$$

$$P_{\text{reg}}^{gg}(x) = 2C_A \left[ \frac{1 - x}{x} - 1 + x(1 - x) \right] \quad (9.18)$$

```

⟨SM physics: public⟩+≡
  public :: pqq_reg

⟨SM physics: procedures⟩+≡
  elemental function pqq_reg (x) result (pqqregx)
    real(kind=default), intent(in) :: x
    real(kind=default) :: pqqregx
    pqqregx = - CF * (one + x)
  end function pqq_reg

⟨SM physics: public⟩+≡
  public :: pgg_reg

⟨SM physics: procedures⟩+≡
  elemental function pgg_reg (x) result (pggregx)
    real(kind=default), intent(in) :: x
    real(kind=default) :: pggregx
    pggregx = two * CA * ((one - x)/x - one + x*(one - x))
  end function pgg_reg

```

Here, we collect the expressions needed for integrated Catani-Seymour dipoles, and the so-called flavor kernels. We always distinguish between the “ordinary” Catani-Seymour version, and the one including a phase-space slicing parameter,  $\alpha$ .

The standard flavor kernels  $\bar{K}^{ab}$  are:

$$\bar{K}^{qg}(x) = \bar{K}^{\bar{q}g}(x) = P^{qg}(x) \log((1-x)/x) + CF \times x \quad (9.19)$$

$$\bar{K}^{gq}(x) = \bar{K}^{g\bar{q}}(x) = P^{gq}(x) \log((1-x)/x) + TR \times 2x(1-x) \quad (9.20)$$

$$\begin{aligned} \bar{K}^{qq} = & CF \left[ \left( \frac{2}{1-x} \log \frac{1-x}{x} \right)_+ - (1+x) \log((1-x)/x) + (1-x) \right] \\ & - (5 - \pi^2) \cdot CF \cdot \delta(1-x) \end{aligned} \quad (9.21)$$

$$\begin{aligned} \bar{K}^{gg} = & 2C_A \left[ \left( \frac{1}{1-x} \log \frac{1-x}{x} \right)_+ + \left( \frac{1-x}{x} - 1 + x(1-x) \right) \log((1-x)/x) \right] \\ & - \delta(1-x) \left[ \left( \frac{50}{9} - \pi^2 \right) C_A - \frac{16}{9} T_R N_f \right] \end{aligned} \quad (9.22)$$

```

⟨SM physics: public⟩+≡
public :: kbarqg

⟨SM physics: procedures⟩+≡
function kbarqg (x) result (kbarqgx)
    real(kind=default), intent(in) :: x
    real(kind=default) :: kbarqgx
    kbarqgx = pqg(x) * log((one-x)/x) + CF * x
end function kbarqg

⟨SM physics: public⟩+≡
public :: kbargq

⟨SM physics: procedures⟩+≡
function kbargq (x) result (kbargqx)
    real(kind=default), intent(in) :: x
    real(kind=default) :: kbargqx
    kbargqx = pgq(x) * log((one-x)/x) + two * TR * x * (one - x)
end function kbargq

⟨SM physics: public⟩+≡
public :: kbarqq

⟨SM physics: procedures⟩+≡
function kbarqq (x,eps) result (kbarqqx)
    real(kind=default), intent(in) :: x, eps
    real(kind=default) :: kbarqqx
    kbarqqx = CF*(log_plus_distr(x,eps) - (one+x) * log((one-x)/x) + (one - &
        x) - (five - pi**2) * delta(x,eps))
end function kbarqq

⟨SM physics: public⟩+≡
public :: kbargg

⟨SM physics: procedures⟩+≡
function kbargg (x,eps,nf) result (kbarggx)
    real(kind=default), intent(in) :: x, eps, nf
    real(kind=default) :: kbarggx
    kbarggx = CA * (log_plus_distr(x,eps) + two * ((one-x)/x - one + &

```

```

        x*(one-x) * log((1-x)/x)) - delta(x,eps) * &
        ((50.0_default/9.0_default - pi**2) * CA - &
        16.0_default/9.0_default * TR * nf)
end function kbargg

```

The  $\tilde{K}$  are used when two identified hadrons participate:

$$\tilde{K}^{ab}(x) = P_{\text{reg}}^{ab}(x) \cdot \log(1-x) + \delta^{ab} \mathbf{T}_a^2 \left[ \left( \frac{2}{1-x} \log(1-x) \right)_+ - \frac{\pi^2}{3} \delta(1-x) \right] \quad (9.23)$$

```

⟨SM physics: public⟩+≡
public :: ktilddeqq
⟨SM physics: procedures⟩+≡
function ktilddeqq (x,eps) result (ktilddeqqx)
    real(kind=default), intent(in) :: x, eps
    real(kind=default) :: ktilddeqqx
    ktilddeqqx = pqq_reg (x) * log(one-x) + CF * (- log2_plus_distr (x,eps) &
        - pi**2/three * delta(x,eps))
end function ktilddeqq

⟨SM physics: public⟩+≡
public :: ktilddeqg
⟨SM physics: procedures⟩+≡
function ktilddeqg (x,eps) result (ktilddeqgx)
    real(kind=default), intent(in) :: x, eps
    real(kind=default) :: ktilddeqgx
    ktilddeqgx = pqg (x) * log(one-x)
end function ktilddeqg

⟨SM physics: public⟩+≡
public :: ktilddegq
⟨SM physics: procedures⟩+≡
function ktilddegq (x,eps) result (ktilddegqx)
    real(kind=default), intent(in) :: x, eps
    real(kind=default) :: ktilddegqx
    ktilddegqx = pgq (x) * log(one-x)
end function ktilddegq

⟨SM physics: public⟩+≡
public :: ktildegg
⟨SM physics: procedures⟩+≡
function ktildegg (x,eps) result (ktildeggx)
    real(kind=default), intent(in) :: x, eps
    real(kind=default) :: ktildeggx
    ktildeggx = pgg_reg (x) * log(one-x) + CA * (- &
        log2_plus_distr (x,eps) - pi**2/three * delta(x,eps))
end function ktildegg

```

The insertion operator might not be necessary for a GOLEM interface but is demanded by the Les Houches NLO accord. It is a three-dimensional array, where the index always gives the inverse power of the DREG expansion parameter,  $\epsilon$ .

```

⟨SM physics: public⟩+≡
    public :: insert_q
⟨SM physics: procedures⟩+≡
    pure function insert_q ()
        real(kind=default), dimension(0:2) :: insert_q
        insert_q(0) = gamma_q + k_q - pi**2/three * CF
        insert_q(1) = gamma_q
        insert_q(2) = CF
    end function insert_q

⟨SM physics: public⟩+≡
    public :: insert_g
⟨SM physics: procedures⟩+≡
    pure function insert_g (nf)
        real(kind=default), intent(in) :: nf
        real(kind=default), dimension(0:2) :: insert_g
        insert_g(0) = gamma_g (nf) + k_g (nf) - pi**2/three * CA
        insert_g(1) = gamma_g (nf)
        insert_g(2) = CA
    end function insert_g

```

For better convergence, one can exclude regions of phase space with a slicing parameter from the dipole subtraction procedure. First of all, the  $K$  functions get modified:

$$K_i(\alpha) = K_i - \mathbf{T}_i^2 \log^2 \alpha + \gamma_i(\alpha - 1 - \log \alpha) \quad (9.24)$$

```

⟨SM physics: public⟩+≡
    public :: k_q_al, k_g_al
⟨SM physics: procedures⟩+≡
    pure function k_q_al (alpha)
        real(kind=default), intent(in) :: alpha
        real(kind=default) :: k_q_al
        k_q_al = k_q - CF * (log(alpha))**2 + gamma_q * &
                  (alpha - one - log(alpha))
    end function k_q_al

    pure function k_g_al (alpha, nf)
        real(kind=default), intent(in) :: alpha, nf
        real(kind=default) :: k_g_al
        k_g_al = k_g (nf) - CA * (log(alpha))**2 + gamma_g (nf) * &
                  (alpha - one - log(alpha))
    end function k_g_al

```

The  $+$ -distribution, but with a phase-space slicing parameter,  $\alpha$ ,  $P_{1-\alpha}(x) = \left(\frac{1}{1-x}\right)^{1-x}$ . Since we need the fatal error message here, this function cannot be elemental.

```

⟨SM physics: public⟩+≡
    public :: plus_distr_al

```

```

⟨SM physics: procedures⟩+≡
  function plus_distr_al (x,alpha,eps) result (plusd_al)
    real(kind=default), intent(in) :: x,  eps, alpha
    real(kind=default) :: plusd_al
    if ((one - alpha) >= (one - eps)) then
      plusd_al = zero
      call msg_fatal ('sm_physics, plus_distr_al: alpha and epsilon chosen wrongly')
    elseif (x < (1.0_default - alpha)) then
      plusd_al = 0
    else if (x > (1.0_default - eps)) then
      plusd_al = log(eps/alpha)/eps
    else
      plusd_al = one/(one-x)
    end if
  end function plus_distr_al

```

Introducing phase-space slicing parameters, these standard flavor kernels  $\bar{K}^{ab}$  become:

$$\bar{K}_\alpha^{qg}(x) = \bar{K}_\alpha^{\bar{q}g}(x) = P^{qg}(x) \log(\alpha(1-x)/x) + C_F \times x \quad (9.25)$$

$$\bar{K}_\alpha^{gq}(x) = \bar{K}_\alpha^{g\bar{q}}(x) = P^{gq}(x) \log(\alpha(1-x)/x) + T_R \times 2x(1-x) \quad (9.26)$$

$$\begin{aligned} \bar{K}_\alpha^{qq} = & C_F(1-x) + P_{\text{reg}}^{qq}(x) \log \frac{\alpha(1-x)}{x} \\ & + C_F \delta(1-x) \log^2 \alpha + C_F \left( \frac{2}{1-x} \log \frac{1-x}{x} \right)_+ \\ & - \left( \gamma_q + K_q(\alpha) - \frac{5}{6} \pi^2 C_F \right) \cdot \delta(1-x) C_F \left[ + \frac{2}{1-x} \log \left( \frac{\alpha(2-x)}{1+\alpha-x} \right) - \theta(1-\alpha-x) \cdot \left( \frac{2}{1-x} \right)_+ \right] \end{aligned} \quad (9.27)$$

$$\begin{aligned} \bar{K}_\alpha^{gg} = & P_{\text{reg}}^{gg}(x) \log \frac{\alpha(1-x)}{x} + C_A \delta(1-x) \log^2 \alpha \\ & + C_A \left( \frac{2}{1-x} \log \frac{1-x}{x} \right)_+ - \left( \gamma_g + K_g(\alpha) - \frac{5}{6} \pi^2 C_A \right) \cdot \delta(1-x) C_A \left[ + \frac{2}{1-x} \log \left( \frac{\alpha(2-x)}{1+\alpha-x} \right) - \theta(1-\alpha-x) \cdot \left( \frac{2}{1-x} \right)_+ \right] \end{aligned} \quad (9.28)$$

```

⟨SM physics: public⟩+≡
  public :: kbarqg_al
⟨SM physics: procedures⟩+≡

    end if
end function ktilddeqq_al

```

This is a logarithmic +-distribution,  $\left(\frac{\log((1-x)/x)}{1-x}\right)_+$ . For the sampling, we need the integral over this function over the incomplete sampling interval  $[0, 1 - \epsilon]$ , which is  $\log^2(x) + 2Li_2(x) - \frac{\pi^2}{3}$ . As this function is negative definite for  $\epsilon > 0.1816$ , we take a hard upper limit for that sampling parameter, irrespective of the fact what the user chooses.

```
(SM physics: public)+≡
public :: log_plus_distr

(SM physics: procedures)+≡

    elseif (x > (1.0_default - eps)) then
        lpd_al = - ((log(eps))**2 - (log(alpha))**2)/eps
    else
        lpd_al = two*log(one/(one-x))/(one-x)
```

```

    end if
end function log2_plus_distr_al
```

#### 9.4.8 Splitting Functions

Analogue to the regularized distributions of the last subsection, we give here the unregularized splitting functions, relevant for the parton shower algorithm. We can use this unregularized version since there will be a cut-off  $\epsilon$  that ensures that  $\{z, 1-z\} > \epsilon(t)$ . This cut-off separates resolvable from unresolvable emissions.

`p_xxx` are the kernels that are summed over helicity:

```

⟨SM physics: public⟩+≡
  public :: p_qqg
  public :: p_gqq
  public :: p_ggg

q → qg
⟨SM physics: procedures⟩+≡
  elemental function p_qqg (z) result (P)
    real(default), intent(in) :: z
    real(default) :: P
    P = CF * (one + z**2) / (one - z)
  end function p_qqg

g → q̄q
⟨SM physics: procedures⟩+≡
  elemental function p_gqq (z) result (P)
    real(default), intent(in) :: z
    real(default) :: P
    P = TR * (z**2 + (one - z)**2)
  end function p_gqq

g → gg
⟨SM physics: procedures⟩+≡
  elemental function p_ggg (z) result (P)
    real(default), intent(in) :: z
    real(default) :: P
    P = NC * ((one - z) / z + z / (one - z) + z * (one - z))
  end function p_ggg
```

Analytically integrated splitting kernels:

```

⟨SM physics: public⟩+≡
  public :: integral_over_p_qqg
  public :: integral_over_p_gqq
  public :: integral_over_p_ggg

⟨SM physics: procedures⟩+≡
  pure function integral_over_p_qqg (zmin, zmax) result (integral)
    real(default), intent(in) :: zmin, zmax
    real(default) :: integral
    integral = (two / three) * (- zmax**2 + zmin**2 - &
      two * (zmax - zmin) + four * log((one - zmin) / (one - zmax)))
  end function integral_over_p_qqg
```

```

pure function integral_over_p_gqq (zmin, zmax) result (integral)
    real(default), intent(in) :: zmin, zmax
    real(default) :: integral
    integral = 0.5_default * ((two / three) * &
        (zmax**3 - zmin**3) - (zmax**2 - zmin**2) + (zmax - zmin))
end function integral_over_p_gqq

pure function integral_over_p_ggg (zmin, zmax) result (integral)
    real(default), intent(in) :: zmin, zmax
    real(default) :: integral
    integral = three * ((log(zmax) - two * zmax - &
        log(one - zmax) + zmax**2 / two - zmax**3 / three) - &
        (log(zmin) - zmin - zmin - log(one - zmin) + zmin**2 &
        / two - zmin**3 / three) )
end function integral_over_p_ggg

```

We can also use (massless) helicity dependent splitting functions:

*(SM physics: public)* +≡  
`public :: p_qqq_pol`

$q_a \rightarrow q_b g_c$ , the helicity of the quark is not changed by gluon emission and the gluon is preferably polarized in the branching plane ( $l_c = 1$ ):

*(SM physics: procedures)* +≡  
`elemental function p_qqq_pol (z, l_a, l_b, l_c) result (P)
 real(default), intent(in) :: z
 integer, intent(in) :: l_a, l_b, l_c
 real(default) :: P
 if (l_a /= l_b) then
 P = zero
 return
 end if
 if (l_c == -1) then
 P = one - z
 else
 P = (one + z)**2 / (one - z)
 end if
 P = P * CF
end function p_qqq_pol`

#### 9.4.9 Unit tests

Test module, followed by the corresponding implementation module.

*(sm\_physics\_ut.f90)* ≡  
`<File header>`

```

module sm_physics_ut
    use unit_tests
    use sm_physics_uti

```

*(Standard module head)*

*(SM physics: public test)*

```

use unit_tests, only: nearly_equal, vanishes, assert

use sm_physics

⟨Standard module head⟩

⟨SM physics: test declarations⟩

contains

⟨SM physics: tests⟩

end module sm_physics_uti

API: driver for the unit tests below.

⟨SM physics: public test⟩≡
public :: sm_physics_test

⟨SM physics: test driver⟩≡
subroutine sm_physics_test (u, results)
integer, intent(in) :: u
type(test_results_t), intent(inout) :: results
⟨SM physics: execute tests⟩
end subroutine sm_physics_test

```

## Splitting functions

```

⟨SM physics: execute tests⟩≡
call test (sm_physics_1, "sm_physics_1", &
           "Splitting functions", &
           u, results)

⟨SM physics: test declarations⟩≡
public :: sm_physics_1

⟨SM physics: tests⟩≡
subroutine sm_physics_1 (u)
integer, intent(in) :: u
real(default) :: z = 0.75_default

write (u, "(A)")  "* Test output: sm_physics_1"
write (u, "(A)")  "* Purpose: check analytic properties"

```

```

write (u, "(A)")

write (u, "(A)")  "* Splitting functions:"
write (u, "(A)")

call assert (u, vanishes (p_qqg_pol (z, +1, -1, +1)))
call assert (u, vanishes (p_qqg_pol (z, +1, -1, -1)))
call assert (u, vanishes (p_qqg_pol (z, -1, +1, +1)))
call assert (u, vanishes (p_qqg_pol (z, -1, +1, -1)))

call assert (u, nearly_equal ( &
    p_qqg_pol (z, +1, +1, -1) + p_qqg_pol (z, +1, +1, +1), &
    p_qqg (z)))

write (u, "(A)")
write (u, "(A)")  "* Test output end: sm_physics_1"

end subroutine sm_physics_1

```

## 9.5 QCD Coupling

We provide various distinct implementations of the QCD coupling. In this module, we define an abstract data type and three implementations: fixed, running with  $\alpha_s(M_Z)$  as input, and running with  $\Lambda_{\text{QCD}}$  as input. We use the functions defined above in the module `sm_physics` but provide a common interface. Later modules may define additional implementations.

```
(sm_qcd.f90)≡
  <File header>

  module sm_qcd

    <Use kinds>
    use io_units
    use format_defs, only: FMT_12
    use unit_tests
    use diagnostics
    use md5
    use physics_defs
    use sm_physics

    <Standard module head>

    <SM qcd: public>
    <SM qcd: types>
    <SM qcd: interfaces>
    contains
    <SM qcd: procedures>
  end module sm_qcd
```

### 9.5.1 Coupling: Abstract Data Type

This is the abstract version of the QCD coupling implementation.

```
<SM qcd: public>≡
  public :: alpha_qcd_t

<SM qcd: types>≡
  type, abstract :: alpha_qcd_t
  contains
    <SM qcd: alpha qcd: TBP>
  end type alpha_qcd_t
```

There must be an output routine.

```
<SM qcd: alpha qcd: TBP>≡
  procedure (alpha_qcd_write), deferred :: write
```

```

⟨SM qcd: interfaces⟩≡
  abstract interface
    subroutine alpha_qcd_write (object, unit)
      import
      class(alpha_qcd_t), intent(in) :: object
      integer, intent(in), optional :: unit
    end subroutine alpha_qcd_write
  end interface

```

This method computes the running coupling, given a certain scale. All parameters (reference value, order of the approximation, etc.) must be set before calling this.

```

⟨SM qcd: alpha qcd: TBP⟩+≡
  procedure (alpha_qcd_get), deferred :: get
⟨SM qcd: interfaces⟩+≡
  abstract interface
    function alpha_qcd_get (alpha_qcd, scale) result (alpha)
      import
      class(alpha_qcd_t), intent(in) :: alpha_qcd
      real(default), intent(in) :: scale
      real(default) :: alpha
    end function alpha_qcd_get
  end interface

```

### 9.5.2 Fixed Coupling

In this version, the  $\alpha_s$  value is fixed, the `scale` argument of the `get` method is ignored. There is only one parameter, the value. By default, this is the value at  $M_Z$ .

```

⟨SM qcd: public⟩+≡
  public :: alpha_qcd_fixed_t
⟨SM qcd: types⟩+≡
  type, extends (alpha_qcd_t) :: alpha_qcd_fixed_t
    real(default) :: val = ALPHA_QCD_MZ_REF
    contains
      ⟨SM qcd: alpha qcd fixed: TBP⟩
    end type alpha_qcd_fixed_t

```

Output.

```

⟨SM qcd: alpha qcd fixed: TBP⟩≡
  procedure :: write => alpha_qcd_fixed_write
⟨SM qcd: procedures⟩≡
  subroutine alpha_qcd_fixed_write (object, unit)
    class(alpha_qcd_fixed_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)
    write (u, "(3x,A)") "QCD parameters (fixed coupling):"
    write (u, "(5x,A," // FMT_12 // ")") "alpha = ", object%val

```

```
end subroutine alpha_qcd_fixed_write
```

Calculation: the scale is ignored in this case.

```
<SM qcd: alpha qcd fixed: TBP>+≡
procedure :: get => alpha_qcd_fixed_get
<SM qcd: procedures>+≡
function alpha_qcd_fixed_get (alpha_qcd, scale) result (alpha)
  class(alpha_qcd_fixed_t), intent(in) :: alpha_qcd
  real(default), intent(in) :: scale
  real(default) :: alpha
  alpha = alpha_qcd%val
end function alpha_qcd_fixed_get
```

### 9.5.3 Running Coupling

In this version, the  $\alpha_s$  value runs relative to the value at a given reference scale. There are two parameters: the value of this scale (default:  $M_Z$ ), the value of  $\alpha_s$  at this scale, and the number of effective flavors. Furthermore, we have the order of the approximation.

```
<SM qcd: public>+≡
public :: alpha_qcd_from_scale_t
<SM qcd: types>+≡
type, extends (alpha_qcd_t) :: alpha_qcd_from_scale_t
  real(default) :: mu_ref = MZ_REF
  real(default) :: ref = ALPHA_QCD_MZ_REF
  integer :: order = 0
  integer :: nf = 5
contains
<SM qcd: alpha qcd from scale: TBP>
end type alpha_qcd_from_scale_t
```

Output.

```
<SM qcd: alpha qcd from scale: TBP>≡
procedure :: write => alpha_qcd_from_scale_write
<SM qcd: procedures>+≡
subroutine alpha_qcd_from_scale_write (object, unit)
  class(alpha_qcd_from_scale_t), intent(in) :: object
  integer, intent(in), optional :: unit
  integer :: u
  u = given_output_unit (unit)
  write (u, "(3x,A)") "QCD parameters (running coupling):"
  write (u, "(5x,A," // FMT_12 // "))") "Scale mu = ", object%mu_ref
  write (u, "(5x,A," // FMT_12 // "))") "alpha(mu) = ", object%ref
  write (u, "(5x,A,IO)") "LL order = ", object%order
  write (u, "(5x,A,IO)") "N(flv) = ", object%nf
end subroutine alpha_qcd_from_scale_write
```

Calculation: here, we call the function for running  $\alpha_s$  that was defined in `sm_physics` above. The function does not take into account thresholds, so the number of flavors should be the correct one for the chosen scale. Normally, this should be the  $Z$  boson mass.

```
(SM qcd: alpha qcd from scale: TBP)+≡
procedure :: get => alpha_qcd_from_scale_get
(SM qcd: procedures)+≡
function alpha_qcd_from_scale_get (alpha_qcd, scale) result (alpha)
  class(alpha_qcd_from_scale_t), intent(in) :: alpha_qcd
  real(default), intent(in) :: scale
  real(default) :: alpha
  alpha = running_as (scale, &
    alpha_qcd%ref, alpha_qcd%mu_ref, alpha_qcd%order, &
    real (alpha_qcd%nf, kind=default))
end function alpha_qcd_from_scale_get
```

#### 9.5.4 Running Coupling, determined by $\Lambda_{\text{QCD}}$

In this version, the input are the value  $\Lambda_{\text{QCD}}$  and the order of the approximation.

```
(SM qcd: public)+≡
public :: alpha_qcd_from_lambda_t
(SM qcd: types)+≡
type, extends (alpha_qcd_t) :: alpha_qcd_from_lambda_t
  real(default) :: lambda = LAMBDA_QCD_REF
  integer :: order = 0
  integer :: nf = 5
contains
(SM qcd: alpha qcd from lambda: TBP)
end type alpha_qcd_from_lambda_t
```

Output.

```
(SM qcd: alpha qcd from lambda: TBP)≡
procedure :: write => alpha_qcd_from_lambda_write
(SM qcd: procedures)+≡
subroutine alpha_qcd_from_lambda_write (object, unit)
  class(alpha_qcd_from_lambda_t), intent(in) :: object
  integer, intent(in), optional :: unit
  integer :: u
  u = given_output_unit (unit)
  write (u, "(3x,A)") "QCD parameters (Lambda_QCD as input):"
  write (u, "(5x,A," // FMT_12 // ")") "Lambda_QCD = ", object%lambda
  write (u, "(5x,A,I0)") "LL order = ", object%order
  write (u, "(5x,A,I0)") "N(flv) = ", object%nf
end subroutine alpha_qcd_from_lambda_write
```

Calculation: here, we call the second function for running  $\alpha_s$  that was defined in `sm_physics` above. The  $\Lambda$  value should be the one that is appropriate for the chosen number of effective flavors. Again, thresholds are not incorporated.

```
(SM qcd: alpha qcd from lambda: TBP)+≡
procedure :: get => alpha_qcd_from_lambda_get
```

```

⟨SM qcd: procedures⟩+≡
    function alpha_qcd_from_lambda_get (alpha_qcd, scale) result (alpha)
        class(alpha_qcd_from_lambda_t), intent(in) :: alpha_qcd
        real(default), intent(in) :: scale
        real(default) :: alpha
        alpha = running_as_lam (real (alpha_qcd%nf, kind=default), scale, &
                               alpha_qcd%lambda, alpha_qcd%order)
    end function alpha_qcd_from_lambda_get

```

### 9.5.5 Wrapper type

We could get along with a polymorphic QCD type, but a monomorphic wrapper type with a polymorphic component is easier to handle and probably safer (w.r.t. compiler bugs). However, we keep the object transparent, so we can set the type-specific parameters directly (by a dispatch routine).

```

⟨SM qcd: public⟩+≡
    public :: qcd_t
⟨SM qcd: types⟩+≡
    type :: qcd_t
        class(alpha_qcd_t), allocatable :: alpha
        character(32) :: md5sum = ""
        contains
            ⟨SM qcd: qcd: TBP⟩
    end type qcd_t

```

Output. We first print the polymorphic `alpha` which contains a headline, then any extra components.

```

⟨SM qcd: qcd: TBP⟩≡
    procedure :: write => qcd_write
⟨SM qcd: procedures⟩+≡
    subroutine qcd_write (qcd, unit, show_md5sum)
        class(qcd_t), intent(in) :: qcd
        integer, intent(in), optional :: unit
        logical, intent(in), optional :: show_md5sum
        logical :: show_md5
        integer :: u
        u = given_output_unit (unit)
        show_md5 = .true.; if (present (show_md5sum)) show_md5 = show_md5sum
        if (allocated (qcd%alpha)) then
            call qcd%alpha%write (u)
        else
            write (u, "(3x,A)") "QCD parameters (coupling undefined)"
        end if
        if (show_md5 .and. qcd%md5sum /= "") &
            write (u, "(5x,A,A,A)") "md5sum = '", qcd%md5sum, "'"
    end subroutine qcd_write

```

Compute a MD5 sum for the `alpha_s` setup. This is done by writing them to a temporary file, using a standard format.

```
⟨SM qcd: qcd: TBP⟩+≡
```

```

procedure :: compute_alphas_md5sum => qcd_compute_alphas_md5sum
⟨SM qcd: procedures⟩+≡
  subroutine qcd_compute_alphas_md5sum (qcd)
    class(qcd_t), intent(inout) :: qcd
    integer :: unit
    if (allocated (qcd%alpha)) then
      unit = free_unit ()
      open (unit, status="scratch", action="readwrite")
      call qcd%alpha%write (unit)
      rewind (unit)
      qcd%md5sum = md5sum (unit)
      close (unit)
    end if
  end subroutine qcd_compute_alphas_md5sum

```

Retrieve the MD5 sum of the qcd setup.

```

⟨SM qcd: qcd: TBP⟩+≡
  procedure :: get_md5sum => qcd_get_md5sum
⟨SM qcd: procedures⟩+≡
  function qcd_get_md5sum (qcd) result (md5sum)
    character(32) :: md5sum
    class(qcd_t), intent(inout) :: qcd
    md5sum = qcd%md5sum
  end function qcd_get_md5sum

```

### 9.5.6 Unit tests

Test module, followed by the corresponding implementation module.

```

⟨sm_qcd_ut.f90⟩≡
  ⟨File header⟩

```

```

module sm_qcd_ut
  use unit_tests
  use sm_qcd_uti

```

⟨Standard module head⟩

⟨SM qcd: public test⟩

contains

⟨SM qcd: test driver⟩

```

end module sm_qcd_ut

```

```

⟨sm_qcd_uti.f90⟩≡
  ⟨File header⟩

```

```

module sm_qcd_uti

```

⟨Use kinds⟩

```

use physics_defs, only: MZ_REF

use sm_qcd

(Standard module head)

(SM qcd: test declarations)

contains

(SM qcd: tests)

end module sm_qcd_utl

```

API: driver for the unit tests below.

```

(SM qcd: public test)≡
    public :: sm_qcd_test

(SM qcd: test driver)≡
    subroutine sm_qcd_test (u, results)
        integer, intent(in) :: u
        type(test_results_t), intent(inout) :: results
(SM qcd: execute tests)
    end subroutine sm_qcd_test

```

## QCD Coupling

We check two different implementations of the abstract QCD coupling.

```

(SM qcd: execute tests)≡
    call test (sm_qcd_1, "sm_qcd_1", &
               "running alpha_s", &
               u, results)

(SM qcd: test declarations)≡
    public :: sm_qcd_1

(SM qcd: tests)≡
    subroutine sm_qcd_1 (u)
        integer, intent(in) :: u
        type(qcd_t) :: qcd

        write (u, "(A)")  "* Test output: sm_qcd_1"
        write (u, "(A)")  "* Purpose: compute running alpha_s"

## 9.6 Shower algorithms

```

⟨shower_algorithms.f90⟩≡
⟨File header⟩

module shower_algorithms

⟨Use kinds⟩
use diagnostics
use constants
use rng_base

⟨Standard module head⟩

⟨shower algorithms: public⟩

⟨shower algorithms: interfaces⟩

contains

⟨shower algorithms: procedures⟩

⟨shower algorithms: tests⟩

end module shower_algorithms

```

We want to generate emission variables  $\mathbf{x} \in \mathbb{R}^d$  proportional to

$$f(x) \Delta(f, h(x)) \quad \text{with} \quad (9.30)$$

$$\Delta(f, H) = \exp \left\{ - \int d^d x' f(x') \Theta(h(x') - H) \right\} \quad (9.31)$$

The `true_function`  $f$  is however too complicated and we are only able to generate  $\mathbf{x}$  according to the `overestimator`  $F$ . This algorithm is described in Appendix B of 0709.2092 and is proven e.g. in 1211.7204 and hep-ph/0606275. Intuitively speaking, we overestimate the emission probability and can therefore set `scale_max = scale` if the emission is rejected.

```

⟨shower algorithms: procedures⟩≡
subroutine generate_vetoed (x, rng, overestimator, true_function, &
    sudakov, inverse_sudakov, scale_min)
    real(default), dimension(:), intent(out) :: x

```

# Chapter 10

## Quantum Field Theory Concepts

The objects and methods defined here implement concepts and data for the underlying quantum field theory that we use for computing matrix elements and processes.

**model\_data** Fields and coupling parameters, operators as vertex structures, for a specific model.

**model\_testbed** Provide hooks to deal with a `model_data` extension without referencing it explicitly.

**helicities** Types and methods for spin density matrices.

**colors** Dealing with colored particles, using the color-flow representation.

**flavors** PDG codes and particle properties, depends on the model.

**quantum\_numbers** Quantum numbers and density matrices for entangled particle systems.

## 10.1 Model Data

These data represent a specific Lagrangian in numeric terms. That is, we have the fields with their quantum numbers, the masses, widths and couplings as numerical values, and the vertices as arrays of fields.

We do not store the relations between coupling parameters. They should be represented by expressions for evaluation, implemented as Sindarin objects in a distinct data structure. Neither do we need the algebraic structure of vertices. The field content of vertices is required for the sole purpose of setting up phase space.

```
<model_data.f90>≡
  <File header>

  module model_data

    use diagnostics
    use md5
    use hashes, only: hash
    use physics_defs, only: UNDEFINED, SCALAR

    <Standard module head>

    <Model data: public>

    <Model data: parameters>

    <Model data: types>

    contains

    <Model data: procedures>

  end module model_data
```

### 10.1.1 Physics Parameters

Couplings, masses, and widths are physics parameters. Each parameter has a unique name (used, essentially, for diagnostics output and debugging) and a value. The value may be a real or a complex number, so we provide to implementations of an abstract type.

```
<Model data: public>≡
  public :: modelpar_data_t
```

```

⟨Model data: types⟩≡
  type, abstract :: modelpar_data_t
    private
      type(string_t) :: name
    contains
      ⟨Model data: par data: TBP⟩
  end type modelpar_data_t

  type, extends (modelpar_data_t) :: modelpar_real_t
    private
      real(default) :: value
  end type modelpar_real_t

  type, extends (modelpar_data_t) :: modelpar_complex_t
    private
      complex(default) :: value
  end type modelpar_complex_t

```

Output for diagnostics. Non-advancing.

```

⟨Model data: par data: TBP⟩≡
  procedure :: write => par_write
⟨Model data: procedures⟩≡
  subroutine par_write (par, unit)
    class(modelpar_data_t), intent(in) :: par
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)
    write (u, "(1x,A,1x,A)", advance="no")  char (par%name), "="
    select type (par)
    class is (modelpar_real_t)
      write (u, "(" // FMT_19 // ")", advance="no")  par%value
    class is (modelpar_complex_t)
      write (u, "(" // FMT_19 // ",1x,'+',1x," // FMT_19 // ",1x,'I')", &
              advance="no")  par%value
    end select
  end subroutine par_write

```

Pretty-printed on separate line, with fixed line length

```

⟨Model data: par data: TBP⟩+≡
  procedure :: show => par_show
⟨Model data: procedures⟩+≡
  subroutine par_show (par, l, u)
    class(modelpar_data_t), intent(in) :: par
    integer, intent(in) :: l, u
    character(len=l) :: buffer
    buffer = par%name
    select type (par)
    class is (modelpar_real_t)
      write (u, "(4x,A,1x,'=',1x," // FMT_19 // ")")  buffer, par%value
    class is (modelpar_complex_t)
      write (u, "(4x,A,1x,'=',1x," // FMT_19 // ",1x,'+',1x," &
                  // FMT_19 // ",1x,'I')")  buffer, par%value

```

```

    end select
end subroutine par_show

```

Initialize with name and value. The type depends on the argument type. If the type does not match, the value is converted following Fortran rules.

```

<Model data: par data: TBP>+≡
    generic :: init => modelpar_data_init_real, modelpar_data_init_complex
    procedure, private :: modelpar_data_init_real
    procedure, private :: modelpar_data_init_complex

<Model data: procedures>+≡
    subroutine modelpar_data_init_real (par, name, value)
        class(modelpar_data_t), intent(out) :: par
        type(string_t), intent(in) :: name
        real(default), intent(in) :: value
        par%name = name
        par = value
    end subroutine modelpar_data_init_real

    subroutine modelpar_data_init_complex (par, name, value)
        class(modelpar_data_t), intent(out) :: par
        type(string_t), intent(in) :: name
        complex(default), intent(in) :: value
        par%name = name
        par = value
    end subroutine modelpar_data_init_complex

```

Modify the value. We assume that the parameter has been initialized. The type (real or complex) must not be changed, and the name is also fixed.

```

<Model data: par data: TBP>+≡
    generic :: assignment(=) => modelpar_data_set_real, modelpar_data_set_complex
    procedure, private :: modelpar_data_set_real
    procedure, private :: modelpar_data_set_complex

  class is (modelpar_real_t)
    ptr => par%value

```

```

    class default
        ptr => null ()
    end select
end function modelpar_data_get_real_ptr

function modelpar_data_get_complex_ptr (par) result (ptr)
    class(modelpar_data_t), intent(in), target :: par
    complex(default), pointer :: ptr
    select type (par)
    class is (modelpar_complex_t)
        ptr => par%value
    class default
        ptr => null ()
    end select
end function modelpar_data_get_complex_ptr

```

### 10.1.2 Field Data

The field-data type holds all information that pertains to a particular field (or particle) within a particular model. Information such as spin type, particle code etc. is stored within the object itself, while mass and width are associated to parameters, otherwise assumed zero.

```

<Model data: public>+≡
    public :: field_data_t
<Model data: types>+≡
    type :: field_data_t
        private
        type(string_t) :: longname
        integer :: pdg = UNDEFINED
        logical :: visible = .true.
        logical :: parton = .false.
        logical :: gauge = .false.
        logical :: left_handed = .false.
        logical :: right_handed = .false.
        logical :: has_anti = .false.
        logical :: p_is_stable = .true.
        logical :: p_decays_isotropically = .false.
        logical :: p_decays_diagonal = .false.
        logical :: p_has_decay_helicity = .false.
        integer :: p_decay_helicity = 0
        logical :: a_is_stable = .true.
        logical :: a_decays_isotropically = .false.
        logical :: a_decays_diagonal = .false.
        logical :: a_has_decay_helicity = .false.
        integer :: a_decay_helicity = 0

### 10.1.3 Vertex data

The vertex object contains an array of particle-data pointers, for which we need a separate type. (We could use the flavor type defined in another module.)

The program does not (yet?) make use of vertex definitions, so they are not stored here.

```

<Model data: types>+≡
  type :: field_data_p
    type(field_data_t), pointer :: p => null ()
  end type field_data_p

<Model data: types>+≡
  type :: vertex_t
    private
    logical :: trilinear
    integer, dimension(:), allocatable :: pdg
    type(field_data_p), dimension(:), allocatable :: prt
    contains
      <Model data: vertex: TBP>
  end type vertex_t

<Model data: vertex: TBP>≡
  procedure :: write => vertex_write
<Model data: procedures>+≡
  subroutine vertex_write (vtx, unit)
    class(vertex_t), intent(in) :: vtx
    integer, intent(in), optional :: unit
    integer :: u, i
    u = given_output_unit (unit)
    write (u, "(3x,A)", advance="no")  "vertex"
    do i = 1, size (vtx%prt)
      if (associated (vtx%prt(i)%p)) then
        write (u, "(1x,A)", advance="no")  &
          "'", // char (vtx%prt(i)%p%get_name (vtx%pdg(i) < 0)) &
          "'"
      else
        write (u, "(1x,I7)", advance="no")  vtx%pdg(i)
      end if
    end do
    write (u, *)
  end subroutine vertex_write

```

Initialize using PDG codes. The model is used for finding particle data pointers associated with the pdg codes.

```

<Model data: vertex: TBP>+≡
  procedure :: init => vertex_init

```

```

⟨Model data: procedures⟩+≡
    subroutine vertex_init (vtx, pdg, model)
        class(vertex_t), intent(out) :: vtx
        integer, dimension(:), intent(in) :: pdg
        type(model_data_t), intent(in), target, optional :: model
        integer :: i
        allocate (vtx%pdg (size (pdg)))
        allocate (vtx%prt (size (pdg)))
        vtx%trilinear = size (pdg) == 3
        vtx%pdg = pdg
        if (present (model)) then
            do i = 1, size (pdg)
                vtx%prt(i)%p => model%get_field_ptr (pdg(i))
            end do
        end if
    end subroutine vertex_init

```

Copy vertex: we must reassign the field-data pointer to a new model.

```

⟨Model data: vertex: TBP⟩+≡
    procedure :: copy_from => vertex_copy_from
⟨Model data: procedures⟩+≡
    subroutine vertex_copy_from (vtx, old_vtx, new_model)
        class(vertex_t), intent(out) :: vtx
        class(vertex_t), intent(in) :: old_vtx
        type(model_data_t), intent(in), target, optional :: new_model
        call vtx%init (old_vtx%pdg, new_model)
    end subroutine vertex_copy_from

```

Single-particle lookup: Given a particle code, we return matching codes if present, otherwise zero. Actually, we return the antiparticles of the matching codes, as appropriate for computing splittings.

```

⟨Model data: vertex: TBP⟩+≡
    procedure :: get_match => vertex_get_match
⟨Model data: procedures⟩+≡
    subroutine vertex_get_match (vtx, pdg1, pdg2)
        class(vertex_t), intent(in) :: vtx
        integer, intent(in) :: pdg1
        integer, dimension(:), allocatable, intent(out) :: pdg2
        integer :: i, j
        do i = 1, size (vtx%pdg)
            if (vtx%pdg(i) == pdg1) then
                allocate (pdg2 (size (vtx%pdg) - 1))
                do j = 1, i-1
                    pdg2(j) = anti (j)
                end do
                do j = i, size (pdg2)
                    pdg2(j) = anti (j+1)
                end do
                exit
            end if
        end do
    contains

```

```

function anti (i) result (pdg)
    integer, intent(in) :: i
    integer :: pdg
    if (vtx%prt(i)%p%has_antiparticle ()) then
        pdg = - vtx%pdg(i)
    else
        pdg = vtx%pdg(i)
    end if
end function anti
end subroutine vertex_get_match

```

To access this from the outside, we create an iterator. The iterator has the sole purpose of returning the matching particles for a given array of PDG codes.

```

<Model data: public>+≡
    public :: vertex_iterator_t

<Model data: types>+≡
    type :: vertex_iterator_t
        private
        class(model_data_t), pointer :: model => null ()
        integer, dimension(:), allocatable :: pdg
        integer :: vertex_index = 0
    contains
        procedure :: init => vertex_iterator_init
        procedure :: get_next_match => vertex_iterator_get_next_match
    end type vertex_iterator_t

```

We initialize the iterator for a particular model with the pdg index of the particle we are looking at.

```

<Model data: procedures>+≡
    subroutine vertex_iterator_init (it, model, pdg)
        class(vertex_iterator_t), intent(out) :: it
        class(model_data_t), intent(in), target :: model
        integer, dimension(:), intent(in) :: pdg
        it%model => model
        allocate (it%pdg (size (pdg)), source = pdg)
    end subroutine vertex_iterator_init

    subroutine vertex_iterator_get_next_match (it, pdg_match)
        class(vertex_iterator_t), intent(inout) :: it
        integer, dimension(:), allocatable, intent(out) :: pdg_match
        integer :: i, j
        do i = it%vertex_index + 1, size (it%model%vtx)
            do j = 1, size (it%pdg)
                call vertex_get_match (it%model%vtx(i), it%pdg(j), pdg_match)
                if (allocated (pdg_match)) then
                    it%vertex_index = i
                    return
                end if
            end do
        end do
        it%vertex_index = 0
    end subroutine vertex_iterator_get_next_match

```

#### 10.1.4 Vertex lookup table

The vertex lookup table is a hash table: given two particle codes, we check which codes are allowed for the third one.

The size of the hash table should be large enough that collisions are rare. We first select a size based on the number of vertices (multiplied by six because all permutations count), with some margin, and then choose the smallest integer power of two larger than this.

```
(Model data: parameters)≡
    integer, parameter :: VERTEX_TABLE_SCALE_FACTOR = 60

(Model data: procedures)+≡
    function vertex_table_size (n_vtx) result (n)
        integer(i32) :: n
        integer, intent(in) :: n_vtx
        integer :: i, s
        s = VERTEX_TABLE_SCALE_FACTOR * n_vtx
        n = 1
        do i = 1, 31
            n = ishft (n, 1)
            s = ishft (s,-1)
            if (s == 0) exit
        end do
    end function vertex_table_size
```

The specific hash function takes two particle codes (arbitrary integers) and returns a 32-bit integer. It makes use of the universal function `hash` which operates on a byte array.

```
(Model data: procedures)+≡
    function hash2 (pdg1, pdg2)
        integer(i32) :: hash2
        integer, intent(in) :: pdg1, pdg2
        integer(i8), dimension(1) :: mold
        hash2 = hash (transfer ([pdg1, pdg2], mold))
    end function hash2
```

Each entry in the vertex table stores the two particle codes and an array of possibilities for the third code.

```
(Model data: types)+≡
    type :: vertex_table_entry_t
        private
        integer :: pdg1 = 0, pdg2 = 0
        integer :: n = 0
        integer, dimension(:), allocatable :: pdg3
    end type vertex_table_entry_t
```

The vertex table:

```
(Model data: types)+≡
    type :: vertex_table_t
```

```

type(vertex_table_entry_t), dimension(:), allocatable :: entry
integer :: n_collisions = 0
integer(i32) :: mask
contains
<Model data: vertex table: TBP>
end type vertex_table_t

```

Output.

```

<Model data: vertex table: TBP>≡
procedure :: write => vertex_table_write
<Model data: procedures>+≡
subroutine vertex_table_write (vt, unit)
class(vertex_table_t), intent(in) :: vt
integer, intent(in), optional :: unit
integer :: u, i
character(9) :: size_pdg3
u = given_output_unit (unit)
write (u, "(A)") "vertex hash table:"
write (u, "(A,I7)") " size = ", size (vt%entry)
write (u, "(A,I7)") " used = ", count (vt%entry%n /= 0)
write (u, "(A,I7)") " coll = ", vt%n_collisions
do i = lbound (vt%entry, 1), ubound (vt%entry, 1)
if (vt%entry(i)%n /= 0) then
    write (size_pdg3, "(I7)") size (vt%entry(i)%pdg3)
    write (u, "(A,1x,I7,1x,A,2(1x,I7),A," // &
           size_pdg3 // "(1x,I7)") &
           " ", i, ":" , vt%entry(i)%pdg1, &
           vt%entry(i)%pdg2, "->, vt%entry(i)%pdg3
end if
end do
end subroutine vertex_table_write

```

Initializing the vertex table: This is done in two passes. First, we scan all permutations for all vertices and count the number of entries in each bucket of the hashtable. Then, the buckets are allocated accordingly and filled.

Collision resolution is done by just incrementing the hash value until an empty bucket is found. The vertex table size is fixed, since we know from the beginning the number of entries.

```

<Model data: vertex table: TBP>+≡
procedure :: init => vertex_table_init
<Model data: procedures>+≡
subroutine vertex_table_init (vt, prt, vtx)

### 10.1.5 Model Data Record

This type collects the model data as defined above.

We deliberately implement the parameter arrays as pointer arrays. We thus avoid keeping track of TARGET attributes.

```

⟨Model data: public⟩+≡
public :: model_data_t
⟨Model data: types⟩+≡
type :: model_data_t
private
type(string_t) :: name
type(modelpar_real_t), dimension(:), pointer :: par_real => null ()
type(modelpar_complex_t), dimension(:), pointer :: par_complex => null ()
type(field_data_t), dimension(:), allocatable :: field
type(vertex_t), dimension(:), allocatable :: vtx
type(vertex_table_t) :: vt
contains
⟨Model data: model data: TBP⟩
end type model_data_t

```

Finalizer, deallocate pointer arrays.

```
<Model data: model data: TBP>≡
    procedure :: final => model_data_final
<Model data: procedures>+≡
    subroutine model_data_final (model)
        class(model_data_t), intent(inout) :: model
        deallocate (model%par_real)
        deallocate (model%par_complex)
    end subroutine model_data_final
```

Output. The signature matches the signature of the high-level `model_write` procedure, so some of the options don't actually apply.

```
<Model data: model data: TBP>+≡
    procedure :: write => model_data_write
<Model data: procedures>+≡
    subroutine model_data_write (model, unit, verbose, &
        show_md5sum, show_variables, show_parameters, &

        end if
    end associate
    end do
end subroutine model_data_get_all_pdg

```

Return pointer to the field array.

```

<Model data: model data: TBP>+≡
procedure :: get_field_array_ptr => model_data_get_field_array_ptr
<Model data: procedures>+≡
function model_data_get_field_array_ptr (model) result (ptr)
    class(model_data_t), intent(in), target :: model
    type(field_data_t), dimension(:), pointer :: ptr
    ptr => model%field
end function model_data_get_field_array_ptr

```

Return pointer to a field. The identifier should be the unique long name, the PDG code, or the index.

We can issue an error message, if the `check` flag is set. We never return an error if the PDG code is zero, this yields just a null pointer.

```

end subroutine model_data_init_sm_test

```

## 10.2 Model Testbed

The standard way of defining a model uses concrete variables and expressions to interpret the model file. Some of this is not available at the point of use. This is no problem for the WHIZARD program as a whole, but unit tests are kept local to their respective module and don't access all definitions.

Instead, we introduce a separate module that provides hooks, one for initializing a model and one for finalizing a model. The main program can assign real routines to the hooks (procedure pointers of abstract type) before unit tests are called. The unit tests can call the abstract routines without knowing about their implementation.

```
(model_testbed.f90)≡
  module model_testbed

    <File header>

    <Use strings>
    use model_data
    use var_base

    <Standard module head>

    <Model testbed: public>

    <Model testbed: variables>

    <Model testbed: interfaces>

  end module model_testbed
```

### 10.2.1 Abstract Model Handlers

Both routines take a polymorphic model (data) pointer, which is allocated/deallocated inside the subroutine. The model constructor `prepare_model` requires the model name as input. It can, optionally, return a link to the variable list of the model.

```
<Model testbed: public>≡
  public :: prepare_model
  public :: cleanup_model

<Model testbed: variables>≡
  procedure (prepare_model_proc), pointer :: prepare_model => null ()
  procedure (cleanup_model_proc), pointer :: cleanup_model => null ()

<Model testbed: interfaces>≡
  abstract interface
    subroutine prepare_model_proc (model, name, vars)
      import
      class(model_data_t), pointer, intent(inout) :: model
      type(string_t), intent(in) :: name
      class(vars_t), pointer, intent(out), optional :: vars
    end subroutine prepare_model_proc
  end interface
```

```
abstract interface
    subroutine cleanup_model_proc (model)
        import
        class(model_data_t), pointer, intent(inout) :: model
    end subroutine cleanup_model_proc
end interface
```

## 10.3 Helicities

This module defines types and tools for dealing with helicity information.

```
(helicities.f90)≡
  ⟨File header⟩

  module helicities

    use io_units

    ⟨Standard module head⟩

    ⟨Helicities: public⟩

    ⟨Helicities: types⟩

    ⟨Helicities: interfaces⟩

    contains

    ⟨Helicities: procedures⟩

  end module helicities
```

### 10.3.1 Helicity types

Helicities may be defined or undefined, corresponding to a polarized or unpolarized state. Each helicity is actually a pair of helicities, corresponding to an entry in the spin density matrix. Obviously, diagonal entries are distinguished.

```
(Helicities: public)≡
  public :: helicity_t

(Helicities: types)≡
  type :: helicity_t
    private
    logical :: defined = .false.
    integer :: h1, h2
  contains
    ⟨Helicities: helicity: TBP⟩
  end type helicity_t
```

Constructor functions, for convenience:

```
(Helicities: public)+≡
  public :: helicity

(Helicities: interfaces)≡
  interface helicity
    module procedure helicity0, helicity1, helicity2
  end interface helicity
```

```

⟨Helicities: procedures⟩≡
  pure function helicity0 () result (hel)
    type(helicity_t) :: hel
  end function helicity0

  elemental function helicity1 (h) result (hel)
    type(helicity_t) :: hel
    integer, intent(in) :: h
    call hel%init (h)
  end function helicity1

  elemental function helicity2 (h2, h1) result (hel)
    type(helicity_t) :: hel
    integer, intent(in) :: h1, h2
    call hel%init (h2, h1)
  end function helicity2

```

Initializers.

Note: conceptually, the argument to initializers should be INTENT(OUT). However, Interp. F08/0033 prohibited this. The reason is that, in principle, the call could result in the execution of an impure finalizer for a type extension of `hel` (ugh).

```

⟨Helicities: helicity: TBP⟩≡
  generic :: init => helicity_init0, helicity_init1, helicity_init2
  procedure, private :: helicity_init0
  procedure, private :: helicity_init1
  procedure, private :: helicity_init2

⟨Helicities: procedures⟩+≡
  elemental subroutine helicity_init0 (hel)
    class(helicity_t), intent(inout) :: hel
    hel%defined = .false.
  end subroutine helicity_init0

  elemental subroutine helicity_init1 (hel, h)
    class(helicity_t), intent(inout) :: hel
    integer, intent(in) :: h
    hel%defined = .true.
    hel%h1 = h
    hel%h2 = h
  end subroutine helicity_init1

  elemental subroutine helicity_init2 (hel, h1, h2)
    class(helicity_t), intent(inout) :: hel
    integer, intent(in) :: h1, h2
    hel%defined = .true.
    hel%h2 = h2
    hel%h1 = h1
  end subroutine helicity_init2

```

Undefine:

```

⟨Helicities: helicity: TBP⟩+≡
  procedure :: undefine => helicity_undefine

```

```

⟨Helicities: procedures⟩+≡
  elemental subroutine helicity_undefine (hel)
    class(helicity_t), intent(inout) :: hel
    hel%defined = .false.
  end subroutine helicity_undefine

```

Diagonalize by removing the second entry (use with care!)

```

⟨Helicities: helicity: TBP⟩+≡
  procedure :: diagonalize => helicity_diagonalize
⟨Helicities: procedures⟩+≡
  elemental subroutine helicity_diagonalize (hel)
    class(helicity_t), intent(inout) :: hel
    hel%h2 = hel%h1
  end subroutine helicity_diagonalize

```

Output (no linebreak). No output if undefined.

```

⟨Helicities: helicity: TBP⟩+≡
  procedure :: write => helicity_write
⟨Helicities: procedures⟩+≡
  subroutine helicity_write (hel, unit)
    class(helicity_t), intent(in) :: hel
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit);  if (u < 0)  return
    if (hel%defined) then
      write (u, "(A)", advance="no") "h("
      write (u, "(I0)", advance="no") hel%h1
      if (hel%h1 /= hel%h2) then
        write (u, "(A)", advance="no") "|"
        write (u, "(I0)", advance="no") hel%h2
      end if
      write (u, "(A)", advance="no") ")"
    end if
  end subroutine helicity_write

```

Binary I/O. Write contents only if defined.

```

⟨Helicities: helicity: TBP⟩+≡
  procedure :: write_raw => helicity_write_raw
  procedure :: read_raw => helicity_read_raw
⟨Helicities: procedures⟩+≡
  subroutine helicity_write_raw (hel, u)
    class(helicity_t), intent(in) :: hel
    integer, intent(in) :: u
    write (u) hel%defined
    if (hel%defined) then
      write (u) hel%h1, hel%h2
    end if
  end subroutine helicity_write_raw

  subroutine helicity_read_raw (hel, u, iostat)
    class(helicity_t), intent(out) :: hel

```

```

integer, intent(in) :: u
integer, intent(out), optional :: iostat
read (u, iostat=iostat) hel%defined
if (hel%defined) then
    read (u, iostat=iostat) hel%h1, hel%h2
end if
end subroutine helicity_read_raw

```

### 10.3.2 Predicates

Check if the helicity is defined:

```

⟨Helicities: helicity: TBP⟩+≡
    procedure :: is_defined => helicity_is_defined
⟨Helicities: procedures⟩+≡
    elemental function helicity_is_defined (hel) result (defined)
        logical :: defined
        class(helicity_t), intent(in) :: hel
        defined = hel%defined
    end function helicity_is_defined

```

Return true if the two helicities are equal or the particle is unpolarized:

```

⟨Helicities: helicity: TBP⟩+≡
    procedure :: is_diagonal => helicity_is_diagonal
⟨Helicities: procedures⟩+≡
    elemental function helicity_is_diagonal (hel) result (diagonal)
        logical :: diagonal
        class(helicity_t), intent(in) :: hel
        if (hel%defined) then
            diagonal = hel%h1 == hel%h2
        else
            diagonal = .true.
        end if
    end function helicity_is_diagonal

```

### 10.3.3 Accessing contents

This returns a two-element array and thus cannot be elemental. The result is unpredictable if the helicity is undefined.

```

⟨Helicities: helicity: TBP⟩+≡
    procedure :: to_pair => helicity_to_pair
⟨Helicities: procedures⟩+≡
    pure function helicity_to_pair (hel) result (h)
        integer, dimension(2) :: h
        class(helicity_t), intent(in) :: hel
        h(1) = hel%h2
        h(2) = hel%h1
    end function helicity_to_pair

```

### 10.3.4 Comparisons

When comparing helicities, if either one is undefined, they are considered to match. In other words, an unpolarized particle matches any polarization. In the `dmatch` variant, it matches only diagonal helicity.

```

⟨Helicities: helicity: TBP⟩+≡
    generic :: operator(.match.) => helicity_match
    generic :: operator(.dmatch.) => helicity_match_diagonal
    generic :: operator(==) => helicity_eq
    generic :: operator(/=) => helicity_neq
    procedure, private :: helicity_match
    procedure, private :: helicity_match_diagonal
    procedure, private :: helicity_eq
    procedure, private :: helicity_neq

⟨Helicities: procedures⟩+≡
    elemental function helicity_match (hel1, hel2) result (eq)
        logical :: eq
        class(helicity_t), intent(in) :: hel1, hel2
        if (hel1%defined .and. hel2%defined) then
            eq = (hel1%h1 == hel2%h1) .and. (hel1%h2 == hel2%h2)
        else
            eq = .true.
        end if
    end function helicity_match

    elemental function helicity_match_diagonal (hel1, hel2) result (eq)
        logical :: eq
        class(helicity_t), intent(in) :: hel1, hel2
        if (hel1%defined .and. hel2%defined) then
            eq = (hel1%h1 == hel2%h1) .and. (hel1%h2 == hel2%h2)
        else if (hel1%defined) then
            eq = hel1%h1 == hel1%h2
        else if (hel2%defined) then
            eq = hel2%h1 == hel2%h2
        else
            eq = .true.
        end if
    end function helicity_match_diagonal

⟨Helicities: procedures⟩+≡
    elemental function helicity_eq (hel1, hel2) result (eq)
        logical :: eq
        class(helicity_t), intent(in) :: hel1, hel2
        if (hel1%defined .and. hel2%defined) then
            eq = (hel1%h1 == hel2%h1) .and. (hel1%h2 == hel2%h2)
        else if (.not. hel1%defined .and. .not. hel2%defined) then
            eq = .true.
        else
            eq = .false.
        end if
    end function helicity_eq

⟨Helicities: procedures⟩+≡

```

```

elemental function helicity_neq (hel1, hel2) result (neq)
logical :: neq
class(helicity_t), intent(in) :: hel1, hel2
if (hel1%defined .and. hel2%defined) then
    neq = (hel1%h1 /= hel2%h1) .or. (hel1%h2 /= hel2%h2)
else if (.not. hel1%defined .and. .not. hel2%defined) then
    neq = .false.
else
    neq = .true.
end if
end function helicity_neq

```

### 10.3.5 Tools

Merge two helicity objects by taking the first entry from the first and the second entry from the second argument. Makes sense only if the input helicities were defined and diagonal. The handling of ghost flags is not well-defined; one should verify beforehand that they match.

```

<Helicities: helicity: TBP>+≡
generic :: operator(.merge.) => merge_helicities
procedure, private :: merge_helicities
<Helicities: procedures>+≡
elemental function merge_helicities (hel1, hel2) result (hel)
type(helicity_t) :: hel
class(helicity_t), intent(in) :: hel1, hel2
if (hel1%defined .and. hel2%defined) then
    call helicity_init2 (hel, hel2%h1, hel1%h1)
else if (hel1%defined) then
    call helicity_init2 (hel, hel1%h2, hel1%h1)
else if (hel2%defined) then
    call helicity_init2 (hel, hel2%h2, hel2%h1)
end if
end function merge_helicities

```

## 10.4 Colors

This module defines a type and tools for dealing with color information.

Each particle can have zero or more (in practice, usually not more than two) color indices. Color indices are positive; flow direction can be determined from the particle nature.

While parton shower matrix elements are diagonal in color, some special applications (e.g., subtractions for NLO matrix elements) require non-diagonal color matrices.

```
{colors.f90}≡
  {File header}

  module colors

    {Use kinds}
    use io_units
    use unit_tests
    use diagnostics

    {Standard module head}

    {Colors: public}

    {Colors: types}

    {Colors: interfaces}

    contains

    {Colors: procedures}

  end module colors
```

### 10.4.1 The color type

A particle may have an arbitrary number of color indices (in practice, from zero to two, but more are possible). This object acts as a container. (The current implementation has a fixed array of length two.)

The fact that color comes as an array prohibits elemental procedures in some places. (May add interfaces and multi versions where necessary.)

The color may be undefined.

NOTE: Due to a compiler bug in nagfor 5.2, we do not use allocatable but fixed-size arrays with dimension 2. Only nonzero entries count. This may be more efficient anyway, but gives up some flexibility. However, the squaring algorithm currently works only for singlets, (anti)triplets and octets anyway, so two components are enough.

This type has to be generalized (abstract type and specific implementations) when trying to pursue generalized color flows or Monte Carlo over continuous color.

```
{Colors: public}≡
  public :: color_t
```

```

⟨Colors: types⟩≡
  type :: color_t
    private
      logical :: defined = .false.
      integer, dimension(2) :: c1 = 0, c2 = 0
      logical :: ghost = .false.
    contains
      ⟨Colors: color: TBP⟩
  end type color_t

```

Initializers:

```

⟨Colors: color: TBP⟩≡
  generic :: init => &
    color_init_trivial, color_init_trivial_ghost, &
    color_init_array, color_init_array_ghost, &
    color_init_arrays, color_init_arrays_ghost
  procedure, private :: color_init_trivial
  procedure, private :: color_init_trivial_ghost
  procedure, private :: color_init_array
  procedure, private :: color_init_array_ghost
  procedure, private :: color_init_arrays
  procedure, private :: color_init_arrays_ghost

```

Undefined color: array remains unallocated

```

⟨Colors: procedures⟩≡
  pure subroutine color_init_trivial (col)
    class(color_t), intent(inout) :: col
    col%defined = .true.
    col%c1 = 0
    col%c2 = 0
    col%ghost = .false.
  end subroutine color_init_trivial

  pure subroutine color_init_trivial_ghost (col, ghost)
    class(color_t), intent(inout) :: col
    logical, intent(in) :: ghost
    col%defined = .true.
    col%c1 = 0
    col%c2 = 0
    col%ghost = ghost
  end subroutine color_init_trivial_ghost

```

This defines color from an arbitrary length color array, suitable for any representation. We may have two color arrays (non-diagonal matrix elements). This cannot be elemental. The third version assigns an array of colors, using a two-dimensional array as input.

```

⟨Colors: procedures⟩+≡
  pure subroutine color_init_array (col, c1)
    class(color_t), intent(inout) :: col
    integer, dimension(:), intent(in) :: c1
    col%defined = .true.
    col%c1 = pack (c1, c1 /= 0, [0,0])
    col%c2 = col%c1

```

```

        col%ghost = .false.
end subroutine color_init_array

pure subroutine color_init_array_ghost (col, c1, ghost)
    class(color_t), intent(inout) :: col
    integer, dimension(:), intent(in) :: c1
    logical, intent(in) :: ghost
    call color_init_array (col, c1)
    col%ghost = ghost
end subroutine color_init_array_ghost

pure subroutine color_init_arrays (col, c1, c2)
    class(color_t), intent(inout) :: col
    integer, dimension(:), intent(in) :: c1, c2
    col%defined = .true.
    if (size (c1) == size (c2)) then
        col%c1 = pack (c1, c1 /= 0, [0,0])
        col%c2 = pack (c2, c2 /= 0, [0,0])
    else if (size (c1) /= 0) then
        col%c1 = pack (c1, c1 /= 0, [0,0])
        col%c2 = col%c1
    else if (size (c2) /= 0) then
        col%c1 = pack (c2, c2 /= 0, [0,0])
        col%c2 = col%c1
    end if
    col%ghost = .false.
end subroutine color_init_arrays

pure subroutine color_init_arrays_ghost (col, c1, c2, ghost)
    class(color_t), intent(inout) :: col
    integer, dimension(:), intent(in) :: c1, c2
    logical, intent(in) :: ghost
    call color_init_arrays (col, c1, c2)
    col%ghost = ghost
end subroutine color_init_arrays_ghost

```

This version is restricted to singlets, triplets, antitriplets, and octets: The input contains the color and anticolor index, each of the may be zero.

```

<Colors: color: TBP>+≡
    procedure :: init_col_acl => color_init_col_acl

<Colors: procedures>+≡
    elemental subroutine color_init_col_acl (col, col_in, acl_in)
        class(color_t), intent(inout) :: col
        integer, intent(in) :: col_in, acl_in
        integer, dimension(0) :: null_array
        select case (col_in)
        case (0)
            select case (acl_in)
            case (0)
                call color_init_array (col, null_array)
            case default
                call color_init_array (col, [-acl_in])
            end select
        end select

```

```

    case default
        select case (acl_in)
        case (0)
            call color_init_array (col, [col_in])
        case default
            call color_init_array (col, [col_in, -acl_in])
        end select
    end select
end subroutine color_init_col_acl

```

This version is used for the external interface. We convert a fixed-size array of colors (for each particle) to the internal form by packing only the nonzero entries.

Some of these procedures produce an arry, so they can't be all type-bound. We implement them as ordinary procedures.

```

<Colors: public>+≡
    public :: color_init_from_array

<Colors: interfaces>≡

        call color_init_from_array1 (col, c1)
        col%ghost = ghost
    end subroutine color_init_from_array1g

    pure subroutine color_init_from_array2 (col, c1)
        integer, dimension(:, :), intent(in) :: c1
        type(color_t), dimension(:, ), intent(inout) :: col
        integer :: i
        do i = 1, size (c1,2)
            call color_init_from_array1 (col(i), c1(:,i))
        end do
    end subroutine color_init_from_array2

```

```

end subroutine color_init_from_array2

pure subroutine color_init_from_array2g (col, c1, ghost)
    integer, dimension(:,:), intent(inout) :: c1
    type(color_t), dimension(:), intent(out) :: col
    logical, intent(in), dimension(:) :: ghost
    call color_init_from_array2 (col, c1)
    col%ghost = ghost
end subroutine color_init_from_array2g

```

Set the ghost property

```

<Colors: color: TBP>+≡
    procedure :: set_ghost => color_set_ghost

<Colors: procedures>+≡
    elemental subroutine color_set_ghost (col, ghost)
        class(color_t), intent(inout) :: col
        logical, intent(in) :: ghost
        col%ghost = ghost
    end subroutine color_set_ghost

```

Undefine the color state:

```

<Colors: color: TBP>+≡
    procedure :: undefine => color_undefine

<Colors: procedures>+≡
    elemental subroutine color_undefine (col, undefine_ghost)
        class(color_t), intent(inout) :: col
        logical, intent(in), optional :: undefine_ghost
        col%defined = .false.
        if (present (undefine_ghost)) then
            if (undefine_ghost) col%ghost = .false.
        else
            col%ghost = .false.
        end if
    end subroutine color_undefine

```

Output. As dense as possible, no linebreak. If color is undefined, no output.

The separate version for a color array suggest two distinct interfaces.

```

<Colors: public>+≡
    public :: color_write

<Colors: interfaces>+≡
    interface color_write
        module procedure color_write_single
        module procedure color_write_array
    end interface color_write

<Colors: color: TBP>+≡
    procedure :: write => color_write_single

```

```

⟨Colors: procedures⟩+≡
    subroutine color_write_single (col, unit)

        do i = 1, size (col)
            if (i > 1) write (u, "(1x)", advance="no")
            call color_write_single (col(i), u)
        end do
        write (u, "(A)", advance="no") "]"
    end subroutine color_write_array

```

Binary I/O. For allocatable colors, this would have to be modified.

```

⟨Colors: color: TBP⟩+≡
    procedure :: write_raw => color_write_raw
    procedure :: read_raw => color_read_raw

⟨Colors: procedures⟩+≡
    subroutine color_write_raw (col, u)
        class(color_t), intent(in) :: col
        integer, intent(in) :: u
        logical :: defined
        defined = col%is_defined () .or. col%is_ghost ()
        write (u) defined
        if (defined) then
            write (u) col%c1, col%c2
            write (u) col%ghost
        end if
    end subroutine color_write_raw

```

```

subroutine color_read_raw (col, u, iostat)
    class(color_t), intent(inout) :: col
    integer, intent(in) :: u
    integer, intent(out), optional :: iostat
    logical :: defined
    read (u, iostat=iostat) col%defined
    if (col%defined) then
        read (u, iostat=iostat) col%c1, col%c2
        read (u, iostat=iostat) col%ghost
    end if
end subroutine color_read_raw

```

### 10.4.2 Predicates

Return the definition status. A color state may be defined but trivial.

```

⟨Colors: color: TBP⟩+≡
    procedure :: is_defined => color_is_defined
    procedure :: is_nonzero => color_is_nonzero

⟨Colors: procedures⟩+≡
    elemental function color_is_defined (col) result (defined)
        logical :: defined
        class(color_t), intent(in) :: col
        defined = col%defined
    end function color_is_defined

    elemental function color_is_nonzero (col) result (flag)
        logical :: flag
        class(color_t), intent(in) :: col
        flag = col%defined &
            .and. .not. col%ghost &
            .and. any (col%c1 /= 0 .or. col%c2 /= 0)
    end function color_is_nonzero

```

Diagonal color objects have only one array allocated:

```

⟨Colors: color: TBP⟩+≡
    procedure :: is_diagonal => color_is_diagonal

⟨Colors: procedures⟩+≡
    elemental function color_is_diagonal (col) result (diagonal)
        logical :: diagonal
        class(color_t), intent(in) :: col
        if (col%defined) then
            diagonal = all (col%c1 == col%c2)
        else
            diagonal = .true.
        end if
    end function color_is_diagonal

```

Return the ghost flag

```

⟨Colors: color: TBP⟩+≡
    procedure :: is_ghost => color_is_ghost

```

```

⟨Colors: procedures⟩+≡
    elemental function color_is_ghost (col) result (ghost)
        logical :: ghost
        class(color_t), intent(in) :: col
        ghost = col%ghost
    end function color_is_ghost

```

The ghost parity: true if the color-ghost flag is set. Again, no TBP since this is an array.

```

⟨Colors: procedures⟩+≡
    pure function color_ghost_parity (col) result (parity)
        type(color_t), dimension(:), intent(in) :: col
        logical :: parity
        parity = mod (count (col%ghost), 2) == 1
    end function color_ghost_parity

```

### 10.4.3 Accessing contents

Return the number of color indices. We assume that it is identical for both arrays.

```

⟨Colors: color: TBP⟩+≡
    procedure, private :: get_number_of_indices => color_get_number_of_indices
⟨Colors: procedures⟩+≡
    elemental function color_get_number_of_indices (col) result (n)
        integer :: n
        class(color_t), intent(in) :: col
        if (col%defined .and. .not. col%ghost) then
            n = count (col%c1 /= 0)
        else
            n = 0
        end if
    end function color_get_number_of_indices

```

Return the (first) color/anticolor entry (assuming that color is diagonal). The result is a positive color index.

```

⟨Colors: color: TBP⟩+≡
    procedure :: get_col => color_get_col
    procedure :: get_acl => color_get_acl
⟨Colors: procedures⟩+≡
    elemental function color_get_col (col) result (c)
        integer :: c
        class(color_t), intent(in) :: col
        integer :: i
        if (col%defined .and. .not. col%ghost) then
            do i = 1, size (col%c1)
                if (col%c1(i) > 0) then
                    c = col%c1(i)
                    return
                end if
            end do
        end if
    end function color_get_col

```

```

    end if
    c = 0
end function color_get_col

elemental function color_get_acl (col) result (c)
    integer :: c
    class(color_t), intent(in) :: col
    integer :: i
    if (col%defined .and. .not. col%ghost) then
        do i = 1, size (col%c1)
            if (col%c1(i) < 0) then
                c = - col%c1(i)
                return
            end if
        end do
    end if
    c = 0
end function color_get_acl

```

Return the color index with highest absolute value

```

<Colors: public>+≡
    public :: color_get_max_value

<Colors: interfaces>+≡
    interface color_get_max_value
        module procedure color_get_max_value0
        module procedure color_get_max_value1
        module procedure color_get_max_value2
    end interface color_get_max_value

<Colors: procedures>+≡
    elemental function color_get_max_value0 (col) result (cmax)
        integer :: cmax
        type(color_t), intent(in) :: col
        if (col%defined .and. .not. col%ghost) then
            cmax = maxval (abs (col%c1))
        else
            cmax = 0
        end if
    end function color_get_max_value0

    pure function color_get_max_value1 (col) result (cmax)
        integer :: cmax
        type(color_t), dimension(:), intent(in) :: col
        cmax = maxval (color_get_max_value0 (col))
    end function color_get_max_value1

    pure function color_get_max_value2 (col) result (cmax)
        integer :: cmax
        type(color_t), dimension(:, :), intent(in) :: col
        integer, dimension(size(col, 2)) :: cm
        integer :: i
        forall (i = 1:size(col, 2))
            cm(i) = color_get_max_value1 (col(:, i))
    end function color_get_max_value2

```

```

    end forall
    cmax = maxval (cm)
end function color_get_max_value2

```

#### 10.4.4 Comparisons

Similar to helicities, colors match if they are equal, or if either one is undefined.

```

<Colors: color: TBP>+≡
    generic :: operator(.match.) => color_match
    generic :: operator(==) => color_eq
    generic :: operator(/=) => color_neq
    procedure, private :: color_match

```

#### 10.4.5 Tools

Shift color indices by a common offset.

```

⟨Colors: color: TBP⟩+≡
  procedure :: add_offset => color_add_offset
⟨Colors: procedures⟩+≡
  elemental subroutine color_add_offset (col, offset)
    class(color_t), intent(inout) :: col
    integer, intent(in) :: offset
    if (col%defined .and. .not. col%ghost) then
      where (col%c1 /= 0) col%c1 = col%c1 + sign (offset, col%c1)
      where (col%c2 /= 0) col%c2 = col%c2 + sign (offset, col%c2)
    end if
  end subroutine color_add_offset

```

Reassign color indices for an array of colored particle in canonical order. The allocated size of the color map is such that two colors per particle can be accommodated.

The algorithm works directly on the contents of the color objects, it

```

⟨Colors: public⟩+≡
  public :: color_canonicalize
⟨Colors: procedures⟩+≡
  subroutine color_canonicalize (col)
    type(color_t), dimension(:), intent(inout) :: col
    integer, dimension(2*size(col)) :: map
    integer :: n_col, i, j, k
    n_col = 0
    do i = 1, size (col)
      if (col(i)%defined .and. .not. col(i)%ghost) then
        do j = 1, size (col(i)%c1)

```

```

        if (col(i)%c1(j) /= 0) then
            k = find (abs (col(i)%c1(j)), map(:n_col))
            if (k == 0) then
                n_col = n_col + 1
                map(n_col) = abs (col(i)%c1(j))
                k = n_col
            end if
            col(i)%c1(j) = sign (k, col(i)%c1(j))
        end if
        if (col(i)%c2(j) /= 0) then
            k = find (abs (col(i)%c2(j)), map(:n_col))
            if (k == 0) then
                n_col = n_col + 1
                map(n_col) = abs (col(i)%c2(j))
                k = n_col
            end if
            col(i)%c2(j) = sign (k, col(i)%c2(j))
        end if
    end do
end if
contains
function find (c, array) result (k)
    integer :: k
    integer, intent(in) :: c
    integer, dimension(:, ), intent(in) :: array
    integer :: i
    k = 0
    do i = 1, size (array)
        if (c == array (i)) then
            k = i
            return
        end if
    end do
end function find
end subroutine color_canonicalize

```

Return an array of different color indices from an array of colors. The last argument is a pseudo-color array, where the color entries correspond to the position of the corresponding index entry in the index array. The colors are assumed to be diagonal.

The algorithm works directly on the contents of the color objects.

```

<Colors: procedures>+≡
subroutine extract_color_line_indices (col, c_index, col_pos)
    type(color_t), dimension(:, ), intent(in) :: col
    integer, dimension(:, ), intent(out), allocatable :: c_index
    type(color_t), dimension(size(col)), intent(out) :: col_pos
    integer, dimension(:, ), allocatable :: c_tmp
    integer :: i, j, k, n, c
    allocate (c_tmp (sum (col%get_number_of_indices ())), source=0)
    n = 0
    SCAN1: do i = 1, size (col)
        if (col(i)%defined .and. .not. col(i)%ghost) then

```

```

SCAN2: do j = 1, 2
    c = abs (col(i)%c1(j))
    if (c /= 0) then
        do k = 1, n
            if (c_tmp(k) == c) then
                col_pos(i)%c1(j) = k
                cycle SCAN2
            end if
        end do
        n = n + 1
        c_tmp(n) = c
        col_pos(i)%c1(j) = n
    end if
    end do SCAN2
end if
end do SCAN1
allocate (c_index (n))
c_index = c_tmp(1:n)
end subroutine extract_color_line_indices

```

Given a color array, pairwise contract the color lines in all possible ways and return the resulting array of arrays. The input color array must be diagonal, and each color should occur exactly twice, once as color and once as anticolor.

Gluon entries with equal color and anticolor are explicitly excluded.

This algorithm is generic, but for long arrays it is neither efficient, nor does it avoid duplicates. It is intended for small arrays, in particular for the state matrix of a structure-function pair.

The algorithm works directly on the contents of the color objects, it thus depends on the implementation.

```

<Colors: public>+≡
    public :: color_array_make_contractions

<Colors: procedures>+≡
    subroutine color_array_make_contractions (col_in, col_out)
        type(color_t), dimension(:), intent(in) :: col_in
        type(color_t), dimension(:, :), intent(out), allocatable :: col_out
        type :: entry_t
            integer, dimension(:, :), allocatable :: map
            type(color_t), dimension(:, :), allocatable :: col
            type(entry_t), pointer :: next => null ()
            logical :: nlo_event = .false.
        end type entry_t
        type :: list_t
            integer :: n = 0
            type(entry_t), pointer :: first => null ()
            type(entry_t), pointer :: last => null ()
        end type list_t
        type(list_t) :: list
        type(entry_t), pointer :: entry
        integer, dimension(:, :), allocatable :: c_index
        type(color_t), dimension(size(col_in)) :: col_pos

  end function compute_color_factor
```

We have a pair of color index arrays which corresponds to a squared matrix element. We want to determine the number of color loops in this square matrix element. So we first copy the colors (stored in a single color array with a pair of color lists in each entry) to a temporary where the color indices are shifted by some offset. We then recursively follow each loop, starting at the first color that has the offset, resetting the first color index to the loop index and each further index to zero as we go. We check that (a) each color index occurs twice

within the left (right) color array, (b) the loops are closed, so we always come back to a line which has the loop index.

In order for the algorithm to work we have to conjugate the colors of initial state particles (one for decays, two for scatterings) into their corresponding anticolors of outgoing particles.

### 10.4.7 The Madgraph color model

This section describes the method for matrix element and color flow calculation within Madgraph.

For each Feynman diagram, the colorless amplitude for a specified helicity and momentum configuration (in- and out- combined) is computed:

$$A_d(p, h) \quad (10.1)$$

Inserting color, the squared matrix element for definite helicity and momentum is

$$M^2(p, h) = \sum_{dd'} A_d(p, h) C_{dd'} A_{d'}^*(p, h) \quad (10.2)$$

where  $C_{dd'}$  describes the color interference of the two diagrams  $A_d$  and  $A'_{d'}$ , which is independent of momentum and helicity and can be calculated for each Feynman diagram pair by reducing it to the corresponding color graph. Obviously, one could combine all diagrams with identical color structure, such that the index  $d$  runs only over different color graphs. For colorless diagrams all elements of  $C_{dd'}$  are equal to unity.

The hermitian matrix  $C_{dd'}$  is diagonalized once and for all, such that it can be written in the form

$$C_{dd'} = \sum_{\lambda} c_d^{\lambda} \lambda c_d^{\lambda*}, \quad (10.3)$$

where the eigenvectors  $c_d$  are normalized,

$$\sum_d |c_d^{\lambda}|^2 = 1, \quad (10.4)$$

and the  $\lambda$  values are the corresponding eigenvalues. In the colorless case, this means  $c_d = 1/\sqrt{N_d}$  for all diagrams ( $N_d$  = number of diagrams), and  $\lambda = N_d$  is the only nonzero eigenvalue.

Consequently, the squared matrix element for definite helicity and momentum can also be written as

$$M^2(p, h) = \sum_{\lambda} A_{\lambda}(p, h) \lambda A_{\lambda}(p, h)^* \quad (10.5)$$

with

$$A_{\lambda}(p, h) = \sum_d c_d^{\lambda} A_d(p, h). \quad (10.6)$$

For generic spin density matrices, this is easily generalized to

$$M^2(p, h, h') = \sum_{\lambda} A_{\lambda}(p, h) \lambda A_{\lambda}(p, h')^* \quad (10.7)$$

To determine the color flow probabilities of a given momentum-helicity configuration, the color flow amplitudes are calculated as

$$a_f(p, h) = \sum_d \beta_d^f A_d(p, h), \quad (10.8)$$

where the coefficients  $\beta_d^f$  describe the amplitude for a given Feynman diagram (or color graph)  $d$  to correspond to a definite color flow  $f$ . They are computed from  $C_{dd'}$  by transforming this matrix into the color flow basis and neglecting all off-diagonal elements. Again, these coefficients do not depend on momentum or helicity and can therefore be calculated in advance. This gives the color flow transition matrix

$$F^f(p, h, h') = a_f(p, h) a_f^*(p, h') \quad (10.9)$$

which is assumed diagonal in color flow space and is separate from the color-summed transition matrix  $M^2$ . They are, however, equivalent (up to a factor) to leading order in  $1/N_c$ , and using the color flow transition matrix is appropriate for matching to hadronization.

Note that the color flow transition matrix is not normalized at this stage. To make use of it, we have to fold it with the in-state density matrix to get a pseudo density matrix

$$\hat{\rho}_{\text{out}}^f(p, h_{\text{out}}, h'_{\text{out}}) = \sum_{h_{\text{in}} h'_{\text{in}}} F^f(p, h, h') \rho_{\text{in}}(p, h_{\text{in}}, h'_{\text{in}}) \quad (10.10)$$

which gets a meaning only after contracted with projections on the outgoing helicity states  $k_{\text{out}}$ , given as linear combinations of helicity states with the unitary coefficient matrix  $c(k_{\text{out}}, h_{\text{out}})$ . Then the probability of finding color flow  $f$  when the helicity state  $k_{\text{out}}$  is measured is given by

$$P^f(p, k_{\text{out}}) = Q^f(p, k_{\text{out}}) / \sum_f Q^f(p, k_{\text{out}}) \quad (10.11)$$

where

$$Q^f(p, k_{\text{out}}) = \sum_{h_{\text{out}} h'_{\text{out}}} c(k_{\text{out}}, h_{\text{out}}) \hat{\rho}_{\text{out}}^f(p, h_{\text{out}}, h'_{\text{out}}) c^*(k_{\text{out}}, h'_{\text{out}}) \quad (10.12)$$

However, if we can assume that the out-state helicity basis is the canonical one, we can throw away the off diagonal elements in the color flow density matrix and normalize the ones on the diagonal to obtain

$$P^f(p, h_{\text{out}}) = \hat{\rho}_{\text{out}}^f(p, h_{\text{out}}, h_{\text{out}}) / \sum_f \hat{\rho}_{\text{out}}^f(p, h_{\text{out}}, h_{\text{out}}) \quad (10.13)$$

Finally, the color-summed out-state density matrix is computed by the scattering formula

$$\rho_{\text{out}}(p, h_{\text{out}}, h'_{\text{out}}) = \sum_{h_{\text{in}} h'_{\text{in}}} M^2(p, h, h') \rho_{\text{in}}(p, h_{\text{in}}, h'_{\text{in}}) \quad (10.14)$$

$$= \sum_{h_{\text{in}} h'_{\text{in}} \lambda} A_\lambda(p, h) \lambda A_\lambda(p, h')^* \rho_{\text{in}}(p, h_{\text{in}}, h'_{\text{in}}), \quad (10.15)$$

The trace of  $\rho_{\text{out}}$  is the squared matrix element, summed over all internal degrees of freedom. To get the squared matrix element for a definite helicity  $k_{\text{out}}$  and color flow  $f$ , one has to project the density matrix onto the given helicity state and multiply with  $P^f(p, k_{\text{out}})$ .

For diagonal helicities the out-state density reduces to

$$\rho_{\text{out}}(p, h_{\text{out}}) = \sum_{h_{\text{in}} \lambda} \lambda |A_\lambda(p, h)|^2 \rho_{\text{in}}(p, h_{\text{in}}). \quad (10.16)$$

Since no basis transformation is involved, we can use the normalized color flow probability  $P^f(p, h_{\text{out}})$  and express the result as

$$\rho_{\text{out}}^f(p, h_{\text{out}}) = \rho_{\text{out}}(p, h_{\text{out}}) P^f(p, h_{\text{out}}) \quad (10.17)$$

$$= \sum_{h_{\text{in}} \lambda} \frac{|a^f(p, h)|^2}{\sum_f |a^f(p, h)|^2} \lambda |A_\lambda(p, h)|^2 \rho_{\text{in}}(p, h_{\text{in}}). \quad (10.18)$$

From these considerations, the following calculation strategy can be derived:

- Before the first event is generated, the color interference matrix  $C_{dd'}$  is computed and diagonalized, so the eigenvectors  $c_d^\lambda$ , eigenvalues  $\lambda$  and color flow coefficients  $\beta_d^f$  are obtained. In practice, these calculations are done when the matrix element code is generated, and the results are hardcoded in the matrix element subroutine as `DATA` statements.
- For each event, one loops over helicities once and stores the matrices  $A_\lambda(p, h)$  and  $a^f(p, h)$ . The allowed color flows, helicity combinations and eigenvalues are each labeled by integer indices, so one has to store complex matrices of dimension  $N_\lambda \times N_h$  and  $N_f \times N_h$ , respectively.
- The further strategy depends on the requested information.
  1. If colorless diagonal helicity amplitudes are required, the eigenvalues  $A_\lambda(p, h)$  are squared, summed with weight  $\lambda$ , and the result contracted with the in-state probability vector  $\rho_{\text{in}}(p, h_{\text{in}})$ . The result is a probability vector  $\rho_{\text{out}}(p, h_{\text{out}})$ .
  2. For colored diagonal helicity amplitudes, the color coefficients  $a^f(p, h)$  are also squared and used as weights to obtain the color-flow probability vector  $\rho_{\text{out}}^f(p, h_{\text{out}})$ .
  3. For colorless non-diagonal helicity amplitudes, we contract the tensor product of  $A_\lambda(p, h)$  with  $A_{\lambda'}(p, h')$ , weighted with  $\lambda$ , with the correlated in-state density matrix, to obtain a correlated out-state density matrix.
  4. In the general (colored, non-diagonal) case, we do the same as in the colorless case, but return the un-normalized color flow density matrix  $\hat{\rho}_{\text{out}}^f(p, h_{\text{out}}, h'_{\text{out}})$  in addition. When the relevant helicity basis is known, the latter can be used by the caller program to determine flow probabilities. (In reality, we assume the canonical basis and reduce the correlated out-state density to its diagonal immediately.)

## 10.5 Flavors: Particle properties

This module contains a type for holding the flavor code, and all functions that depend on the model, i.e., that determine particle properties.

The PDG code is packed in a special `flavor` type. (This prohibits meaningless operations, and it allows for a different implementation, e.g., some non-PDG scheme internally, if appropriate at some point.)

There are lots of further particle properties that depend on the model. Implementing a flyweight pattern, the associated field data object is to be stored in a central area, the `flavor` object just receives a pointer to this, so all queries can be delegated.

```
<flavors.f90>≡
  <File header>

  module flavors

    <Use kinds>
    <Use strings>
    use io_units
    use diagnostics
    use physics_defs, only: UNDEFINED
    use physics_defs, only: INVALID
    use physics_defs, only: HADRON_REMNANT
    use physics_defs, only: HADRON_REMNANT_SINGLETON
    use physics_defs, only: HADRON_REMNANT_TRIPLET
    use physics_defs, only: HADRON_REMNANT_OCTET
    use model_data
    use colors, only: color_t

    <Standard module head>

    <Flavors: public>
    <Flavors: types>
    <Flavors: interfaces>

    contains

    <Flavors: procedures>

  end module flavors
```

### 10.5.1 The flavor type

The flavor type is an integer representing the PDG code, or undefined (zero). Negative codes represent antiflavors. They should be used only for particles which do have a distinct antiparticle.

The `radiated` flag can be set for particles that are the result of a beam-structure interaction (hadron beam remnant, ISR photon, etc.), not of the hard interaction itself.

Further properties of the given flavor can be retrieved via the particle-data pointer, if it is associated.

```
<Flavors: public>≡
    public :: flavor_t

<Flavors: types>≡
    type :: flavor_t
        private
        integer :: f = UNDEFINED
        logical :: radiated = .false.
        type(field_data_t), pointer :: field_data => null ()
    contains
        <Flavors: flavor: TBP>
    end type flavor_t
```

Initializer form. If the model is assigned, the procedure is impure, therefore we have to define a separate array version.

Note: The pure elemental subroutines can't have an intent(out) CLASS argument (because of the potential for an impure finalizer in a type extension), so we stick to intent(inout) and (re)set all components explicitly.

```
<Flavors: flavor: TBP>≡
    generic :: init => &
        flavor_init0_empty, &
        flavor_init0, &
        flavor_init0_field_data, &

        if (iostat /= 0) return
    end if
    read (u, iostat=iostat) flv%radiated
end subroutine flavor_read_raw

```

## Assignment

Default assignment of flavor objects is possible, but cannot be used in pure procedures, because a pointer assignment is involved.

Assign the particle pointer separately. This cannot be elemental, so we define a scalar and an array version explicitly. We refer to an array of flavors, not an array of models.

```
(Flavors: flavor: TBP)+≡  
    procedure :: set_model => flavor_set_model_single  
  
(Flavors: procedures)+≡  
    impure elemental subroutine flavor_set_model_single (flv, model)  
        class(flavor_t), intent(inout) :: flv  
        class(model_data_t), intent(in), target :: model  
        if (flv%f /= UNDEFINED) &  
            flv%field_data => model%get_field_ptr (flv%f)  
    end subroutine flavor_set_model_single
```

## Predicates

Return the definition status. By definition, the flavor object is defined if the flavor PDG code is nonzero.

```
(Flavors: flavor: TBP)+≡  
    procedure :: is_defined => flavor_is_defined  
  
(Flavors: procedures)+≡  
    elemental function flavor_is_defined (flv) result (defined)  
        class(flavor_t), intent(in) :: flv  
        logical :: defined  
        defined = flv%f /= UNDEFINED  
    end function flavor_is_defined
```

Check for valid flavor (including undefined). This is distinct from the `is_defined` status. Invalid flavor is actually a specific PDG code.

```
(Flavors: flavor: TBP)+≡  
    procedure :: is_valid => flavor_is_valid  
  
(Flavors: procedures)+≡  
    elemental function flavor_is_valid (flv) result (valid)  
        class(flavor_t), intent(in) :: flv  
        logical :: valid  
        valid = flv%f /= INVALID  
    end function flavor_is_valid
```

Return true if the particle-data pointer is associated. (Debugging aid)

```
(Flavors: flavor: TBP)+≡  
    procedure :: is_associated => flavor_is_associated  
  
(Flavors: procedures)+≡  
    elemental function flavor_is_associated (flv) result (flag)  
        class(flavor_t), intent(in) :: flv  
        logical :: flag  
        flag = associated (flv%field_data)
```

```
end function flavor_is_associated
```

Check the `radiated` flag. A radiated particle has a definite PDG flavor status, but it is actually a pseudoparticle (a beam remnant) which may be subject to fragmentation.

```
<Flavors: flavor: TBP>+≡  
procedure :: is_radiated => flavor_is_radiated  
<Flavors: procedures>+≡  
elemental function flavor_is_radiated (flv) result (flag)  
  class(flavor_t), intent(in) :: flv  
  logical :: flag  
  flag = flv%radiated  
end function flavor_is_radiated
```

### Accessing contents

With the exception of the PDG code, all particle property enquiries are delegated to the `field_data` pointer. If this is unassigned, some access function will crash.

Return the flavor as an integer

```
<Flavors: flavor: TBP>+≡  
procedure :: get_pdg => flavor_get_pdg  
<Flavors: procedures>+≡  
elemental function flavor_get_pdg (flv) result (f)  
  integer :: f  
  class(flavor_t), intent(in) :: flv  
  f = flv%f  
end function flavor_get_pdg
```

Return the flavor of the antiparticle

```
<Flavors: flavor: TBP>+≡  
procedure :: get_pdg_anti => flavor_get_pdg_anti  
<Flavors: procedures>+≡  
elemental function flavor_get_pdg_anti (flv) result (f)  
  integer :: f  
  class(flavor_t), intent(in) :: flv  
  if (associated (flv%field_data)) then  
    if (flv%field_data%has_antiparticle ()) then  
      f = -flv%f  
    else  
      f = flv%f  
    end if  
  else  
    f = 0  
  end if  
end function flavor_get_pdg_anti
```

Absolute value:

```
<Flavors: flavor: TBP>+≡
    procedure :: get_pdg_abs => flavor_get_pdg_abs
<Flavors: procedures>+≡
    elemental function flavor_get_pdg_abs (flv) result (f)
        integer :: f
        class(flavor_t), intent(in) :: flv
        f = abs (flv%f)
    end function flavor_get_pdg_abs
```

Generic properties

    else
        neq = .true.
    end if

```

```
end function flavor_neq
```

## Tools

Merge two flavor indices. This works only if both are equal or either one is undefined, because we have no off-diagonal flavor entries. Otherwise, generate an invalid flavor.

We cannot use elemental procedures because of the pointer component.

```
<Flavors: public>+≡
  public :: operator(.merge.)

<Flavors: interfaces>≡
  interface operator(.merge.)
    module procedure merge_flavors0
    module procedure merge_flavors1
  end interface

<Flavors: procedures>+≡
  function merge_flavors0 (flv1, flv2) result (flv)
    type(flvor_t) :: flv
    type(flvor_t), intent(in) :: flv1, flv2
    if (flavor_is_defined (flv1) .and. flavor_is_defined (flv2)) then
      if (flv1 == flv2) then
        flv = flv1
      else
        flv%f = INVALID
      end if
    else if (flavor_is_defined (flv1)) then
      flv = flv1
    else if (flavor_is_defined (flv2)) then
      flv = flv2
    end if
  end function merge_flavors0

  function merge_flavors1 (flv1, flv2) result (flv)
    type(flvor_t), dimension(:), intent(in) :: flv1, flv2
    type(flvor_t), dimension(size(flv1)) :: flv
    integer :: i
    do i = 1, size (flv1)
      flv(i) = flv1(i) .merge. flv2(i)
    end do
  end function merge_flavors1
```

Generate consecutive color indices for a given flavor. The indices are counted starting with the stored value of `c`, so new indices are created each time this (impure) function is called. The counter can be reset by the optional argument `c_seed` if desired. The optional flag `reverse` is used only for octets. If set, the color and anticolor entries of the octet particle are exchanged.

```
<Flavors: public>+≡
  public :: color_from_flavor
```

```

(Flavors: interfaces)+≡
interface color_from_flavor
  module procedure color_from_flavor0
  module procedure color_from_flavor1
end interface

(Flavors: procedures)+≡
function color_from_flavor0 (flv, c_seed, reverse) result (col)
  type(color_t) :: col
  type(flvor_t), intent(in) :: flv
  integer, intent(in), optional :: c_seed
  logical, intent(in), optional :: reverse
  integer, save :: c = 1
  logical :: rev
  if (present (c_seed))  c = c_seed
  rev = .false.;  if (present (reverse)) rev = reverse

```

```
else
    aflv%f = flv%f
end if
aflv%field_data => flv%field_data
end function flavor_anti
```

## 10.6 Quantum numbers

This module collects helicity, color, and flavor in a single type and defines procedures

```
(quantum_numbers.f90)≡
  ⟨File header⟩

  module quantum_numbers

    use io_units
    use model_data
    use helicities
    use colors
    use flavors

  ⟨Standard module head⟩

  ⟨Quantum numbers: public⟩

  ⟨Quantum numbers: types⟩

  ⟨Quantum numbers: interfaces⟩

  contains

  ⟨Quantum numbers: procedures⟩

  end module quantum_numbers
```

### 10.6.1 The quantum number type

```
⟨Quantum numbers: public⟩≡
  public :: quantum_numbers_t

  ⟨Quantum numbers: types⟩≡
    type :: quantum_numbers_t
      private
      type(flavor_t) :: f
      type(color_t) :: c
      type(helicity_t) :: h
    contains
    ⟨Quantum numbers: quantum numbers: TBP⟩
  end type quantum_numbers_t
```

Define quantum numbers: Initializer form. All arguments may be present or absent.

Some elemental initializers are impure because they set the `flv` component. This implies transfer of a pointer behind the scenes.

```
⟨Quantum numbers: quantum numbers: TBP⟩≡
  generic :: init => &
    quantum_numbers_init0_f, &
    quantum_numbers_init0_c, &
    quantum_numbers_init0_h, &
```

```

### 10.6.2 I/O

Write the quantum numbers in condensed form, enclosed by square brackets. Color is written only if nontrivial. For convenience, introduce also an array version.

If the `col_verbose` option is set, show the quantum number color also if it is zero, but defined. Otherwise, suppress zero color.

```

end subroutine quantum_numbers_read_raw

```

### 10.6.3 Accessing contents

Color and helicity can be done by elemental functions. Flavor needs impure elemental. We export also the functions directly, this allows us to avoid temporaries in some places.

```

⟨Quantum numbers: public⟩+≡
public :: quantum_numbers_get_flavor
public :: quantum_numbers_get_color
public :: quantum_numbers_get_helicity

⟨Quantum numbers: quantum numbers: TBP⟩+≡
procedure :: get_flavor => quantum_numbers_get_flavor
procedure :: get_color => quantum_numbers_get_color
procedure :: get_helicity => quantum_numbers_get_helicity

⟨Quantum numbers: procedures⟩+≡
impure elemental function quantum_numbers_get_flavor (qn) result (flv)
    type(flavor_t) :: flv
    class(quantum_numbers_t), intent(in) :: qn
    flv = qn%f
end function quantum_numbers_get_flavor

elemental function quantum_numbers_get_color (qn) result (col)
    type(color_t) :: col
    class(quantum_numbers_t), intent(in) :: qn
    col = qn%c
end function quantum_numbers_get_color

elemental function quantum_numbers_get_helicity (qn) result (hel)
    type(helicity_t) :: hel
    class(quantum_numbers_t), intent(in) :: qn
    hel = qn%h
end function quantum_numbers_get_helicity

```

This just resets the ghost property of the color part:

```
(Quantum numbers: quantum numbers: TBP)+≡
    procedure :: set_color_ghost => quantum_numbers_set_color_ghost
(Quantum numbers: procedures)+≡
    elemental subroutine quantum_numbers_set_color_ghost (qn, ghost)
        class(quantum_numbers_t), intent(inout) :: qn
        logical, intent(in) :: ghost
        call qn%c%set_ghost (ghost)
    end subroutine quantum_numbers_set_color_ghost
```

Assign a model to the flavor part of quantum numbers.

```
(Quantum numbers: quantum numbers: TBP)+≡
    procedure :: set_model => quantum_numbers_set_model
(Quantum numbers: procedures)+≡
    impure elemental subroutine quantum_numbers_set_model (qn, model)
        class(quantum_numbers_t), intent(inout) :: qn
        class(model_data_t), intent(in), target :: model
        call qn%f%set_model (model)
    end subroutine quantum_numbers_set_model
```

Set the radiated flag for the flavor component.

```
(Quantum numbers: quantum numbers: TBP)+≡
    procedure :: tag_radiated => quantum_numbers_tag_radiated
(Quantum numbers: procedures)+≡
    elemental subroutine quantum_numbers_tag_radiated (qn)
        class(quantum_numbers_t), intent(inout) :: qn
        call qn%f%tag_radiated ()
    end subroutine quantum_numbers_tag_radiated
```

This is a convenience function: return the color type for the flavor (array).

Note: keep the public version temporarily, this will be used in a complicated expression which triggers a compiler bug (nagfor 5.3) in the TBP version.

```
(Quantum numbers: public)+≡
    public :: quantum_numbers_get_color_type
(Quantum numbers: quantum numbers: TBP)+≡
    procedure :: get_color_type => quantum_numbers_get_color_type
(Quantum numbers: procedures)+≡
    elemental function quantum_numbers_get_color_type (qn) result (color_type)
        integer :: color_type
        class(quantum_numbers_t), intent(in) :: qn
        color_type = qn%f%get_color_type ()
    end function quantum_numbers_get_color_type
```

#### 10.6.4 Predicates

Check if the flavor index is valid (including UNDEFINED).

```
(Quantum numbers: quantum numbers: TBP)+≡
    procedure :: are_valid => quantum_numbers_are_valid
```

```

⟨Quantum numbers: procedures⟩+≡
    elemental function quantum_numbers_are_valid (qn) result (valid)
        logical :: valid
        class(quantum_numbers_t), intent(in) :: qn
        valid = qn%f%is_valid ()
    end function quantum_numbers_are_valid

```

Check if the flavor part has its particle-data pointer associated (debugging aid).

```

⟨Quantum numbers: quantum numbers: TBP⟩+≡
    procedure :: are_associated => quantum_numbers_are_associated
⟨Quantum numbers: procedures⟩+≡
    elemental function quantum_numbers_are_associated (qn) result (flag)
        logical :: flag
        class(quantum_numbers_t), intent(in) :: qn
        flag = qn%f%is_associated ()
    end function quantum_numbers_are_associated

```

Check if the helicity and color quantum numbers are diagonal. (Unpolarized/colorless also counts as diagonal.) Flavor is diagonal by definition.

```

⟨Quantum numbers: quantum numbers: TBP⟩+≡
    procedure :: are_diagonal => quantum_numbers_are_diagonal
⟨Quantum numbers: procedures⟩+≡
    elemental function quantum_numbers_are_diagonal (qn) result (diagonal)
        logical :: diagonal
        class(quantum_numbers_t), intent(in) :: qn
        diagonal = qn%h%is_diagonal () .and. qn%c%is_diagonal ()
    end function quantum_numbers_are_diagonal

```

Check if the color part has the ghost property.

```

⟨Quantum numbers: quantum numbers: TBP⟩+≡
    procedure :: is_color_ghost => quantum_numbers_is_color_ghost
⟨Quantum numbers: procedures⟩+≡
    elemental function quantum_numbers_is_color_ghost (qn) result (ghost)
        logical :: ghost
        class(quantum_numbers_t), intent(in) :: qn
        ghost = qn%c%is_ghost ()
    end function quantum_numbers_is_color_ghost

```

### 10.6.5 Comparisons

Matching and equality is derived from the individual quantum numbers. The variant `fmatch` matches only flavor and helicity. The variant `dhmatch` matches only diagonal helicity, if the matching helicity is undefined.

```

⟨Quantum numbers: quantum numbers: TBP⟩+≡
    generic :: operator(.match.) => quantum_numbers_match
    generic :: operator(.fmatch.) => quantum_numbers_match_f
    generic :: operator(.fhmatch.) => quantum_numbers_match_fh
    generic :: operator(.dhmatch.) => quantum_numbers_match_hel_diag

```

```

generic :: operator(==) => quantum_numbers_eq
generic :: operator(/=) => quantum_numbers_neq
procedure, private :: quantum_numbers_match
procedure, private :: quantum_numbers_match_f
procedure, private :: quantum_numbers_match_fh
procedure, private :: quantum_numbers_match_hel_diag
procedure, private :: quantum_numbers_eq
procedure, private :: quantum_numbers_neq

<Quantum numbers: procedures>+≡
elemental function quantum_numbers_match (qn1, qn2) result (match)
    logical :: match
    class(quantum_numbers_t), intent(in) :: qn1, qn2
    match = (qn1%f .match. qn2%f) .and. &
            (qn1%c .match. qn2%c) .and. &
            (qn1%h .match. qn2%h)
end function quantum_numbers_match

elemental function quantum_numbers_match_f (qn1, qn2) result (match)
    logical :: match
    class(quantum_numbers_t), intent(in) :: qn1, qn2
    match = (qn1%f .match. qn2%f)
end function quantum_numbers_match_f

elemental function quantum_numbers_match_fh (qn1, qn2) result (match)
    logical :: match
    class(quantum_numbers_t), intent(in) :: qn1, qn2
    match = (qn1%f .match. qn2%f) .and. &
            (qn1%h .match. qn2%h)
end function quantum_numbers_match_fh

elemental function quantum_numbers_match_hel_diag (qn1, qn2) result (match)
    logical :: match
    class(quantum_numbers_t), intent(in) :: qn1, qn2
    match = (qn1%f .match. qn2%f) .and. &
            (qn1%c .match. qn2%c) .and. &
            (qn1%h .dmatch. qn2%h)
end function quantum_numbers_match_hel_diag

elemental function quantum_numbers_eq (qn1, qn2) result (eq)
    logical :: eq
    class(quantum_numbers_t), intent(in) :: qn1, qn2
    eq = (qn1%f == qn2%f) .and. &

         (qn1%h == qn2%h)
end function quantum_numbers_eq

elemental function quantum_numbers_neq (qn1, qn2) result (neq)
    logical :: neq
    class(quantum_numbers_t), intent(in) :: qn1, qn2
    neq = (qn1%f /= qn2%f) .or. &
          (qn1%c /= qn2%c) .or. &
          (qn1%h /= qn2%h)
end function quantum_numbers_neq

```

Two sets of quantum numbers are compatible if the individual quantum numbers are compatible, depending on the mask. Flavor has to match, regardless of the flavor mask.

If the color flag is set, color is compatible if the ghost property is identical. If the color flag is unset, color has to be identical. I.e., if the flag is set, the color amplitudes can interfere. If it is not set, they must be identical, and there must be no ghost. The latter property is used for expanding physical color flows.

Helicity is compatible if the mask is unset, otherwise it has to match. This determines if two amplitudes can be multiplied (no mask) or traced (mask).

```
(Quantum numbers: public)+≡
    public :: quantum_numbers_are_compatible

(Quantum numbers: procedures)+≡
    elemental function quantum_numbers_are_compatible (qn1, qn2, mask) &
        result (flag)
    logical :: flag
    type(quantum_numbers_t), intent(in) :: qn1, qn2
    type(quantum_numbers_mask_t), intent(in) :: mask
    if (mask%h .or. mask%hd) then
        flag = (qn1%f .match. qn2%f) .and. (qn1%h .match. qn2%h)
    else
        flag = (qn1%f .match. qn2%f)
    end if
    if (mask%c) then
        flag = flag .and. (qn1%c%is_ghost () .eqv. qn2%c%is_ghost ())
    else
        flag = flag .and. &
            .not. (qn1%c%is_ghost () .or. qn2%c%is_ghost ()) .and. &
            (qn1%c == qn2%c)
    end if
end function quantum_numbers_are_compatible
```

This is the analog for a single quantum-number set. We just check for color ghosts; they are excluded if the color mask is unset (color-flow expansion).

```
(Quantum numbers: public)+≡
    public :: quantum_numbers_are_physical

(Quantum numbers: procedures)+≡
    elemental function quantum_numbers_are_physical (qn, mask) result (flag)
    logical :: flag
    type(quantum_numbers_t), intent(in) :: qn
    type(quantum_numbers_mask_t), intent(in) :: mask
    if (mask%c) then
        flag = .true.
    else
        flag = .not. qn%c%is_ghost ()
    end if
end function quantum_numbers_are_physical
```

### 10.6.6 Operations

Inherited from the color component: reassign color indices in canonical order.

```

⟨Quantum numbers: public⟩+≡
public :: quantum_numbers_canonicalize_color

⟨Quantum numbers: procedures⟩+≡
subroutine quantum_numbers_canonicalize_color (qn)
    type(quantum_numbers_t), dimension(:), intent(inout) :: qn
    call color_canonicalize (qn%c)
end subroutine quantum_numbers_canonicalize_color

```

Inherited from the color component: make a color map for two matching quantum-number arrays.

```

⟨Quantum numbers: public⟩+≡
public :: make_color_map

⟨Quantum numbers: interfaces⟩+≡
interface make_color_map
    module procedure quantum_numbers_make_color_map
end interface make_color_map

⟨Quantum numbers: procedures⟩+≡
subroutine quantum_numbers_make_color_map (map, qn1, qn2)
    integer, dimension(:, :, ), intent(out), allocatable :: map
    type(quantum_numbers_t), dimension(:, ), intent(in) :: qn1, qn2
    call make_color_map (map, qn1%c, qn2%c)
end subroutine quantum_numbers_make_color_map

```

Inherited from the color component: translate the color part using a color-map array

```

⟨Quantum numbers: public⟩+≡
public :: quantum_numbers_translate_color

⟨Quantum numbers: interfaces⟩+≡
interface quantum_numbers_translate_color
    module procedure quantum_numbers_translate_color0
    module procedure quantum_numbers_translate_color1
end interface

⟨Quantum numbers: procedures⟩+≡
subroutine quantum_numbers_translate_color0 (qn, map, offset)
    type(quantum_numbers_t), intent(inout) :: qn
    integer, dimension(:, :, ), intent(in) :: map
    integer, intent(in), optional :: offset
    call color_translate (qn%c, map, offset)
end subroutine quantum_numbers_translate_color0

subroutine quantum_numbers_translate_color1 (qn, map, offset)
    type(quantum_numbers_t), dimension(:, ), intent(inout) :: qn
    integer, dimension(:, :, ), intent(in) :: map
    integer, intent(in), optional :: offset
    call color_translate (qn%c, map, offset)
end subroutine quantum_numbers_translate_color1

```

Inherited from the color component: return the color index with highest absolute value.

Since the algorithm is not elemental, we keep the separate procedures for different array rank.

```

⟨Quantum numbers: public⟩+≡
    public :: quantum_numbers_get_max_color_value

⟨Quantum numbers: interfaces⟩+≡
    interface quantum_numbers_get_max_color_value
        module procedure quantum_numbers_get_max_color_value0
        module procedure quantum_numbers_get_max_color_value1
        module procedure quantum_numbers_get_max_color_value2
    end interface

⟨Quantum numbers: procedures⟩+≡
    pure function quantum_numbers_get_max_color_value0 (qn) result (cmax)
        integer :: cmax
        type(quantum_numbers_t), intent(in) :: qn
        cmax = color_get_max_value (qn%c)
    end function quantum_numbers_get_max_color_value0

    pure function quantum_numbers_get_max_color_value1 (qn) result (cmax)
        integer :: cmax
        type(quantum_numbers_t), dimension(:), intent(in) :: qn
        cmax = color_get_max_value (qn%c)
    end function quantum_numbers_get_max_color_value1

    pure function quantum_numbers_get_max_color_value2 (qn) result (cmax)
        integer :: cmax
        type(quantum_numbers_t), dimension(:, :), intent(in) :: qn
        cmax = color_get_max_value (qn%c)
    end function quantum_numbers_get_max_color_value2

```

Inherited from the color component: add an offset to the indices of the color part

```

⟨Quantum numbers: quantum numbers: TBP⟩+≡
    procedure :: add_color_offset => quantum_numbers_add_color_offset

⟨Quantum numbers: procedures⟩+≡
    elemental subroutine quantum_numbers_add_color_offset (qn, offset)
        class(quantum_numbers_t), intent(inout) :: qn
        integer, intent(in) :: offset
        call qn%c%add_offset (offset)
    end subroutine quantum_numbers_add_color_offset

```

Given a quantum number array, return all possible color contractions, leaving the other quantum numbers intact.

```

⟨Quantum numbers: public⟩+≡
    public :: quantum_number_array_make_color_contractions

⟨Quantum numbers: procedures⟩+≡
    subroutine quantum_number_array_make_color_contractions (qn_in, qn_out)
        type(quantum_numbers_t), dimension(:), intent(in) :: qn_in

```

```

type(quantum_numbers_t), dimension(:, :, ), intent(out), allocatable :: qn_out
type(color_t), dimension(:, :, ), allocatable :: col
integer :: i
call color_array_make_contractions (qn_in%c, col)
allocate (qn_out (size (col, 1), size (col, 2)))
do i = 1, size (qn_out, 2)
    qn_out(:, i)%f = qn_in%f
    qn_out(:, i)%c = col(:, i)
    qn_out(:, i)%h = qn_in%h
end do
end subroutine quantum_number_array_make_color_contractions

```

Inherited from the color component: invert the color, switching particle/antiparticle.

```

<Quantum numbers: quantum numbers: TBP>+≡
procedure :: invert_color => quantum_numbers_invert_color
<Quantum numbers: procedures>+≡
elemental subroutine quantum_numbers_invert_color (qn)
class(quantum_numbers_t), intent(inout) :: qn
call qn%c%invert ()
end subroutine quantum_numbers_invert_color

```

Merge two quantum number sets: for each entry, if both are defined, combine them to an off-diagonal entry (meaningful only if the input was diagonal). If either entry is undefined, take the defined one.

For flavor, off-diagonal entries are invalid, so both flavors must be equal, otherwise an invalid flavor is inserted.

```

<Quantum numbers: public>+≡
public :: operator(.merge.)
<Quantum numbers: interfaces>+≡
interface operator(.merge.)
    module procedure merge_quantum_numbers0
    module procedure merge_quantum_numbers1
end interface

<Quantum numbers: procedures>+≡
function merge_quantum_numbers0 (qn1, qn2) result (qn3)
    type(quantum_numbers_t) :: qn3
    type(quantum_numbers_t), intent(in) :: qn1, qn2
    qn3%f = qn1%f .merge. qn2%f
    qn3%c = qn1%c .merge. qn2%c
    qn3%h = qn1%h .merge. qn2%h
end function merge_quantum_numbers0

function merge_quantum_numbers1 (qn1, qn2) result (qn3)
    type(quantum_numbers_t), dimension(:, ), intent(in) :: qn1, qn2
    type(quantum_numbers_t), dimension(size(qn1)) :: qn3
    qn3%f = qn1%f .merge. qn2%f
    qn3%c = qn1%c .merge. qn2%c
    qn3%h = qn1%h .merge. qn2%h
end function merge_quantum_numbers1

```

### 10.6.7 The quantum number mask

The quantum numbers mask is true for quantum numbers that should be ignored or summed over. The three mandatory entries correspond to flavor, color, and helicity, respectively.

There is an additional entry `cg`: If false, the color-ghosts property should be kept even if color is ignored. This is relevant only if `c` is set, otherwise it is always false.

The flag `hd` tells that only diagonal entries in helicity should be kept. If `h` is set, `hd` is irrelevant and will be kept `.false.`.

```
(Quantum numbers: public)+≡
    public :: quantum_numbers_mask_t
(Quantum numbers: types)+≡
    type :: quantum_numbers_mask_t
        private
        logical :: f = .false.
        logical :: c = .false.
        logical :: cg = .false.
        logical :: h = .false.
        logical :: hd = .false.
    contains
(Quantum numbers: quantum numbers mask: TBP)
end type quantum_numbers_mask_t
```

Define a quantum number mask: Constructor form

```
(Quantum numbers: public)+≡
    public :: quantum_numbers_mask
(Quantum numbers: procedures)+≡
    elemental function quantum_numbers_mask &
        (mask_f, mask_c, mask_h, mask_cg, mask_hd) result (mask)
        type(quantum_numbers_mask_t) :: mask
        logical, intent(in) :: mask_f, mask_c, mask_h
        logical, intent(in), optional :: mask_cg
        logical, intent(in), optional :: mask_hd
        call quantum_numbers_mask_init &
            (mask, mask_f, mask_c, mask_h, mask_cg, mask_hd)
    end function quantum_numbers_mask
```

Define quantum numbers: Initializer form

```
(Quantum numbers: quantum numbers mask: TBP)≡
    procedure :: init => quantum_numbers_mask_init
(Quantum numbers: procedures)+≡
    elemental subroutine quantum_numbers_mask_init &
        (mask, mask_f, mask_c, mask_h, mask_cg, mask_hd)
        class(quantum_numbers_mask_t), intent(inout) :: mask
        logical, intent(in) :: mask_f, mask_c, mask_h
        logical, intent(in), optional :: mask_cg, mask_hd
        mask%f = mask_f
        mask%c = mask_c
        mask%h = mask_h
        mask%cg = .false.
```

```

if (present (mask_cg)) then
    if (mask%c)  mask%cg = mask_cg
else
    mask%cg = mask_c
end if
mask%hd = .false.
if (present (mask_hd)) then
    if (.not. mask%h)  mask%hd = mask_hd
end if
end subroutine quantum_numbers_mask_init

```

Write a quantum numbers mask. We need the stand-alone subroutine for the array case.

```

<Quantum numbers: public>+≡
public :: quantum_numbers_mask_write

<Quantum numbers: interfaces>+≡
interface quantum_numbers_mask_write
    module procedure quantum_numbers_mask_write_single
    module procedure quantum_numbers_mask_write_array
end interface

<Quantum numbers: quantum numbers mask: TBP>+≡
procedure :: write => quantum_numbers_mask_write_single

<Quantum numbers: procedures>+≡
subroutine quantum_numbers_mask_write_single (mask, unit)
    class(quantum_numbers_mask_t), intent(in) :: mask
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit);  if (u < 0)  return
    write (u, "(A)", advance="no") "["
    write (u, "(L1)", advance="no")  mask%f
    write (u, "(L1)", advance="no")  mask%c
    if (.not.mask%cg)  write (u, "('g')", advance="no")
    write (u, "(L1)", advance="no")  mask%h
    if (mask%hd)  write (u, "('d')", advance="no")
    write (u, "(A)", advance="no") "]"
end subroutine quantum_numbers_mask_write_single

subroutine quantum_numbers_mask_write_array (mask, unit)
    type(quantum_numbers_mask_t), dimension(:), intent(in) :: mask
    integer, intent(in), optional :: unit
    integer :: u, i
    u = given_output_unit (unit);  if (u < 0)  return
    write (u, "(A)", advance="no") "["
    do i = 1, size (mask)
        if (i > 1)  write (u, "(A)", advance="no")  "/"
        write (u, "(L1)", advance="no")  mask(i)%f
        write (u, "(L1)", advance="no")  mask(i)%c
        if (.not.mask(i)%cg)  write (u, "('g')", advance="no")
        write (u, "(L1)", advance="no")  mask(i)%h
        if (mask(i)%hd)  write (u, "('d')", advance="no")
    end do
    write (u, "(A)", advance="no") "]"

```

```
end subroutine quantum_numbers_mask_write_array
```

### 10.6.8 Setting mask components

```
(Quantum numbers: quantum numbers mask: TBP)+≡
procedure :: set_flavor => quantum_numbers_mask_set_flavor
procedure :: set_color => quantum_numbers_mask_set_color
procedure :: set_helicity => quantum_numbers_mask_set_helicity

(Quantum numbers: procedures)+≡
elemental subroutine quantum_numbers_mask_set_flavor (mask, mask_f)
  class(quantum_numbers_mask_t), intent(inout) :: mask
  logical, intent(in) :: mask_f
  mask%f = mask_f
end subroutine quantum_numbers_mask_set_flavor

elemental subroutine quantum_numbers_mask_set_color (mask, mask_c, mask_cg)
  class(quantum_numbers_mask_t), intent(inout) :: mask
  logical, intent(in) :: mask_c
  logical, intent(in), optional :: mask_cg
  mask%c = mask_c
  if (present (mask_cg)) then
    if (mask%c) mask%cg = mask_cg
  else
    mask%cg = mask_c
  end if
end subroutine quantum_numbers_mask_set_color

elemental subroutine quantum_numbers_mask_set_helicity (mask, mask_h, mask_hd)
  class(quantum_numbers_mask_t), intent(inout) :: mask
  logical, intent(in) :: mask_h
  logical, intent(in), optional :: mask_hd
  mask%h = mask_h
  if (present (mask_hd)) then
    if (.not. mask%h) mask%hd = mask_hd
  end if
end subroutine quantum_numbers_mask_set_helicity
```

The following routines assign part of a mask, depending on the flags given.

```
(Quantum numbers: quantum numbers mask: TBP)+≡
procedure :: assign => quantum_numbers_mask_assign

(Quantum numbers: procedures)+≡
elemental subroutine quantum_numbers_mask_assign &
  (mask, mask_in, flavor, color, helicity)
  class(quantum_numbers_mask_t), intent(inout) :: mask
  class(quantum_numbers_mask_t), intent(in) :: mask_in
  logical, intent(in), optional :: flavor, color, helicity
  if (present (flavor)) then
    if (flavor) then
      mask%f = mask_in%f
    end if
  end if
```

```

if (present (color)) then
  if (color) then
    mask%c = mask_in%c
    mask%cg = mask_in%cg
  end if
end if
if (present (helicity)) then
  if (helicity) then
    mask%h = mask_in%h
    mask%hd = mask_in%hd
  end if
end if
end subroutine quantum_numbers_mask_assign

```

### 10.6.9 Mask predicates

Return true if either one of the entries is set:

```

⟨Quantum numbers: public⟩+≡
  public :: any

⟨Quantum numbers: interfaces⟩+≡
  interface any
    module procedure quantum_numbers_mask_any
  end interface

⟨Quantum numbers: procedures⟩+≡
  function quantum_numbers_mask_any (mask) result (match)
    logical :: match
    type(quantum_numbers_mask_t), intent(in) :: mask
    match = mask%f .or. mask%c .or. mask%h .or. mask%hd
  end function quantum_numbers_mask_any

```

### 10.6.10 Operators

The OR operation is applied to all components.

```

⟨Quantum numbers: quantum numbers mask: TBP⟩+≡
  generic :: operator(.or.) => quantum_numbers_mask_or
  procedure, private :: quantum_numbers_mask_or

⟨Quantum numbers: procedures⟩+≡
  elemental function quantum_numbers_mask_or (mask1, mask2) result (mask)
    type(quantum_numbers_mask_t) :: mask
    class(quantum_numbers_mask_t), intent(in) :: mask1, mask2
    mask%f = mask1%f .or. mask2%f
    mask%c = mask1%c .or. mask2%c
    if (mask%c) mask%cg = mask1%cg .or. mask2%cg
    mask%h = mask1%h .or. mask2%h
    if (.not. mask%h) mask%hd = mask1%hd .or. mask2%hd
  end function quantum_numbers_mask_or

```

### 10.6.11 Mask comparisons

Return true if the two masks are equivalent / differ:

```
(Quantum numbers: quantum numbers mask: TBP)+≡
    generic :: operator(.eqv.) => quantum_numbers_mask_eqv
    generic :: operator(.neqv.) => quantum_numbers_mask_neqv
    procedure, private :: quantum_numbers_mask_eqv
    procedure, private :: quantum_numbers_mask_neqv

(Quantum numbers: procedures)+≡
    elemental function quantum_numbers_mask_eqv (mask1, mask2) result (eqv)
        logical :: eqv
        class(quantum_numbers_mask_t), intent(in) :: mask1, mask2
        eqv = (mask1%f .eqv. mask2%f) .and. &
               (mask1%c .eqv. mask2%c) .and. &
               (mask1%cg .eqv. mask2%cg) .and. &
               (mask1%h .eqv. mask2%h) .and. &
               (mask1%hd .eqv. mask2%hd)
    end function quantum_numbers_mask_eqv

    elemental function quantum_numbers_mask_neqv (mask1, mask2) result (neqv)
        logical :: neqv
        class(quantum_numbers_mask_t), intent(in) :: mask1, mask2
        neqv = (mask1%f .neqv. mask2%f) .or. &
               (mask1%c .neqv. mask2%c) .or. &
               (mask1%cg .neqv. mask2%cg) .or. &
               (mask1%h .neqv. mask2%h) .or. &
               (mask1%hd .neqv. mask2%hd)
    end function quantum_numbers_mask_neqv
```

### 10.6.12 Apply a mask

Applying a mask to the quantum number object means undefining those entries where the mask is set. The others remain unaffected.

The `hd` mask has the special property that it “diagonalizes” helicity, i.e., the second helicity entry is dropped and the result is a diagonal helicity quantum number.

```
(Quantum numbers: quantum numbers: TBP)+≡
    procedure :: undefine => quantum_numbers_undefine
    procedure :: undefined => quantum_numbers_undefined0

(Quantum numbers: public)+≡
    public :: quantum_numbers_undefined

(Quantum numbers: interfaces)+≡
    interface quantum_numbers_undefined
        module procedure quantum_numbers_undefined0
        module procedure quantum_numbers_undefined1
        module procedure quantum_numbers_undefined11
    end interface
```

```

⟨Quantum numbers: procedures⟩+≡
  elemental subroutine quantum_numbers_undefine (qn, mask)
    class(quantum_numbers_t), intent(inout) :: qn
    type(quantum_numbers_mask_t), intent(in) :: mask
    if (mask%f) call qn%f%undefine ()
    if (mask%c) call qn%c%undefine (undefined_ghost=mask%cg)
    if (mask%h) then
      call qn%h%undefine ()
    else if (mask%hd) then
      if (.not. qn%h%is_diagonal ()) then
        call qn%h%diagonalize ()
      end if
    end if
  end subroutine quantum_numbers_undefine

  function quantum_numbers_undefined0 (qn, mask) result (qn_new)
    class(quantum_numbers_t), intent(in) :: qn
    type(quantum_numbers_mask_t), intent(in) :: mask
    type(quantum_numbers_t) :: qn_new
    select type (qn)
    type is (quantum_numbers_t); qn_new = qn
    end select
    call quantum_numbers_undefine (qn_new, mask)
  end function quantum_numbers_undefined0

  function quantum_numbers_undefined1 (qn, mask) result (qn_new)
    type(quantum_numbers_t), dimension(:), intent(in) :: qn
    type(quantum_numbers_mask_t), intent(in) :: mask
    type(quantum_numbers_t), dimension(size(qn)) :: qn_new
    qn_new = qn
    call quantum_numbers_undefine (qn_new, mask)
  end function quantum_numbers_undefined1

  function quantum_numbers_undefined11 (qn, mask) result (qn_new)
    type(quantum_numbers_t), dimension(:), intent(in) :: qn
    type(quantum_numbers_mask_t), dimension(:), intent(in) :: mask
    type(quantum_numbers_t), dimension(size(qn)) :: qn_new
    qn_new = qn
    call quantum_numbers_undefine (qn_new, mask)
  end function quantum_numbers_undefined11

```

Return true if the input quantum number set has entries that would be removed by the applied mask, e.g., if polarization is defined but `mask%h` is set:

```

⟨Quantum numbers: quantum numbers: TBP⟩+≡
  procedure :: are_redundant => quantum_numbers_are_redundant

⟨Quantum numbers: procedures⟩+≡
  elemental function quantum_numbers_are_redundant (qn, mask) &
    result (redundant)
    logical :: redundant
    class(quantum_numbers_t), intent(in) :: qn
    type(quantum_numbers_mask_t), intent(in) :: mask
    redundant = .false.
    if (mask%f) then

```

```

    redundant = qn%f%is_defined ()
end if
if (mask%c) then
    redundant = qn%c%is_defined ()
end if
if (mask%h) then
    redundant = qn%h%is_defined ()
else if (mask%hd) then
    redundant = .not. qn%h%is_diagonal ()
end if
end function quantum_numbers_are_redundant

```

Return true if the helicity flag is set or the diagonal-helicity flag is set.

```

⟨Quantum numbers: quantum numbers mask: TBP⟩+≡
procedure :: diagonal_helicity => quantum_numbers_mask_diagonal_helicity
⟨Quantum numbers: procedures⟩+≡
elemental function quantum_numbers_mask_diagonal_helicity (mask) &
    result (flag)
logical :: flag
class(quantum_numbers_mask_t), intent(in) :: mask
flag = mask%h .or. mask%hd
end function quantum_numbers_mask_diagonal_helicity

```

# Chapter 11

## Transition Matrices and Evaluation

The modules in this chapter implement transition matrices and calculations. The functionality is broken down in three modules

**state\_matrices** represent state and transition density matrices built from particle quantum numbers (helicity, color, flavor)

**interactions** extend state matrices with the record of particle momenta. They also distinguish in- and out-particles and store parent-child relations.

**evaluators** These objects extend interaction objects by the information how to calculate matrix elements from products and squares of other interactions. They implement the methods to actually compute those matrix elements.

## 11.1 State matrices

This module deals with the internal state of a particle system, i.e., with its density matrix in flavor, color, and helicity space.

```
(state_matrices.f90)≡
  ⟨File header⟩

  module state_matrices

    ⟨Use kinds⟩
    use io_units
    use format_utils, only: pac_fmt
    use format_defs, only: FMT_17, FMT_19
    use diagnostics
    use sorting
    use model_data
    use flavors
    use colors
    use helicities
    use quantum_numbers

    ⟨Standard module head⟩

    ⟨State matrices: public⟩

    ⟨State matrices: parameters⟩

    ⟨State matrices: types⟩

    ⟨State matrices: interfaces⟩

    contains

    ⟨State matrices: procedures⟩

  end module state_matrices
```

### 11.1.1 Nodes of the quantum state trie

A quantum state object represents an unnormalized density matrix, i.e., an array of possibilities for flavor, color, and helicity indices with associated complex values. Physically, the trace of this matrix is the summed squared matrix element for an interaction, and the matrix elements divided by this value correspond to the flavor-color-helicity density matrix. (Flavor and color are diagonal.)

We store density matrices as tries, that is, as trees where each branching represents the possible quantum numbers of a particle. The first branching is the first particle in the system. A leaf (the node corresponding to the last particle) contains the value of the matrix element.

Each node contains a flavor, color, and helicity entry. Note that each of those entries may be actually undefined, so we can also represent, e.g., unpolarized particles.

The value is meaningful only for leaves, which have no child nodes. There is a pointer to the parent node which allows for following the trie downwards from a leaf, it is null for a root node. The child nodes are implemented as a list, so there is a pointer to the first and last child, and each node also has a `next` pointer to the next sibling.

The root node does not correspond to a particle, only its children do. The quantum numbers of the root node are irrelevant and will not be set. However, we use a common type for the three classes (root, branch, leaf); they may easily be distinguished by the association status of parent and child.

### Node type

The node is linked in all directions: the parent, the first and last in the list of children, and the previous and next sibling. This allows us for adding and removing nodes and whole branches anywhere in the trie. (Circular links are not allowed, however.). The node holds its associated set of quantum numbers. The integer index, which is set only for leaf nodes, is the index of the corresponding matrix element value within the state matrix.

Temporarily, matrix-element values may be stored within a leaf node. This is used during state-matrix factorization. When the state matrix is `freezed`, these values are transferred to the matrix-element array within the host state matrix.

```
(State matrices: types)≡
type :: node_t
  private
    type(quantum_numbers_t) :: qn
    type(node_t), pointer :: parent => null ()
    type(node_t), pointer :: child_first => null ()
    type(node_t), pointer :: child_last => null ()
    type(node_t), pointer :: next => null ()
    type(node_t), pointer :: previous => null ()
    integer :: me_index = 0
    integer, dimension(:), allocatable :: me_count
    complex(default) :: me = 0
end type node_t
```

### Operations on nodes

Recursively deallocate all children of the current node. This includes any values associated with the children.

```
(State matrices: procedures)≡
pure recursive subroutine node_delete_offspring (node)
  type(node_t), pointer :: node
  type(node_t), pointer :: child
  child => node%child_first
  do while (associated (child))
    node%child_first => node%child_first%next
    call node_delete_offspring (child)
    deallocate (child)
    child => node%child_first
  end do
```

```

    node%child_last => null ()
end subroutine node_delete_offspring

```

Remove a node including its offspring. Adjust the pointers of parent and siblings, if necessary.

```

<State matrices: procedures>+≡
pure subroutine node_delete (node)
    type(node_t), pointer :: node
    call node_delete_offspring (node)
    if (associated (node%previous)) then
        node%previous%next => node%next
    else if (associated (node%parent)) then
        node%parent%child_first => node%next
    end if
    if (associated (node%next)) then
        node%next%previous => node%previous
    else if (associated (node%parent)) then
        node%parent%child_last => node%previous
    end if
    deallocate (node)
end subroutine node_delete

```

Append a child node

```

<State matrices: procedures>+≡
subroutine node_append_child (node, child)
    type(node_t), target, intent(inout) :: node
    type(node_t), pointer :: child
    allocate (child)
    if (associated (node%child_last)) then
        node%child_last%next => child
        child%previous => node%child_last
    else
        node%child_first => child
    end if
    node%child_last => child
    child%parent => node
end subroutine node_append_child

```

## I/O

Output of a single node, no recursion. We print the quantum numbers in square brackets, then the value (if any).

```

<State matrices: procedures>+≡
subroutine node_write (node, me_array, verbose, unit, col_verbose, testflag)
    type(node_t), intent(in) :: node
    complex(default), dimension(:), intent(in), optional :: me_array
    logical, intent(in), optional :: verbose, col_verbose, testflag
    integer, intent(in), optional :: unit
    logical :: verb
    integer :: u
    character(len=7) :: fmt

```

```

call pac_fmt (fmt, FMT_19, FMT_17, testflag)
verb = .false.; if (present (verbose)) verb = verbose
u = given_output_unit (unit); if (u < 0) return
call node%qn%write (u, col_verbose)
if (node%me_index /= 0) then
    write (u, "(A,I0,A)", advance="no")  " => ME(", node%me_index, ")"
    if (present (me_array)) then
        write (u, "(A)", advance="no")  " = "
        write (u, "(',' // fmt // ',,' // fmt // ',')'", &
               advance="no") pacify_complex (me_array(node%me_index))
    end if
end if
write (u, *)
if (verb) then
    call ptr_write ("parent      ", node%parent)
    call ptr_write ("child_first", node%child_first)
    call ptr_write ("child_last  ", node%child_last)
    call ptr_write ("next       ", node%next)
    call ptr_write ("previous    ", node%previous)
end if
contains
subroutine ptr_write (label, node)
    character(*), intent(in) :: label
    type(node_t), pointer :: node
    if (associated (node)) then
        write (u, "(10x,A,1x,'->',1x)", advance="no") label
        call node%qn%write (u, col_verbose)
        write (u, *)
    end if
end subroutine ptr_write
end subroutine node_write

```

Recursive output of a node:

```

<State matrices: procedures>+≡
recursive subroutine node_write_rec (node, me_array, verbose, &
    indent, unit, col_verbose, testflag)
    type(node_t), intent(in), target :: node
    complex(default), dimension(:), intent(in), optional :: me_array
    logical, intent(in), optional :: verbose, col_verbose, testflag
    integer, intent(in), optional :: indent
    integer, intent(in), optional :: unit
    type(node_t), pointer :: current
    logical :: verb
    integer :: i, u
    verb = .false.; if (present (verbose)) verb = verbose
    i = 0; if (present (indent)) i = indent
    u = given_output_unit (unit); if (u < 0) return
    current => node%child_first
    do while (associated (current))
        write (u, "(A)", advance="no") repeat (" ", i)
        call node_write (current, me_array, verbose=verb, &
            unit=u, col_verbose=col_verbose, testflag=testflag)
        call node_write_rec (current, me_array, verbose=verb, &
            indent=i+2, unit=u, col_verbose=col_verbose, testflag=testflag)
    end do
end recursive subroutine node_write_rec

```

```

        current => current%next
    end do
end subroutine node_write_rec

Binary I/O. Matrix elements are written only for leaf nodes.
<State matrices: procedures>+≡
recursive subroutine node_write_raw_rec (node, u)
    type(node_t), intent(in), target :: node
    integer, intent(in) :: u
    logical :: associated_child_first, associated_next
    call node%qn%write_raw (u)
    associated_child_first = associated (node%child_first)
    write (u) associated_child_first
    associated_next = associated (node%next)
    write (u) associated_next
    if (associated_child_first) then
        call node_write_raw_rec (node%child_first, u)
    else
        write (u) node%me_index
        write (u) node%me
    end if
    if (associated_next) then
        call node_write_raw_rec (node%next, u)
    end if
end subroutine node_write_raw_rec

recursive subroutine node_read_raw_rec (node, u, parent, iostat)
    type(node_t), intent(out), target :: node
    integer, intent(in) :: u
    type(node_t), intent(in), optional, target :: parent
    integer, intent(out), optional :: iostat
    logical :: associated_child_first, associated_next
    type(node_t), pointer :: child
    call node%qn%read_raw (u, iostat=iostat)
    read (u, iostat=iostat) associated_child_first
    read (u, iostat=iostat) associated_next
    if (present (parent)) node%parent => parent
    if (associated_child_first) then
        allocate (child)
        node%child_first => child
        node%child_last => null ()
        call node_read_raw_rec (child, u, node, iostat=iostat)
        do while (associated (child))
            child%previous => node%child_last
            node%child_last => child
            child => child%next
        end do
    else
        read (u, iostat=iostat) node%me_index
        read (u, iostat=iostat) node%me
    end if
    if (associated_next) then
        allocate (node%next)
        call node_read_raw_rec (node%next, u, parent, iostat=iostat)
    end if
end subroutine node_read_raw_rec

```

```

    end if
end subroutine node_read_raw_rec
```

### 11.1.2 State matrix

#### Definition

The quantum state object is a container that keeps and hides the root node. For direct accessibility of values, they are stored in a separate array. The leaf nodes of the quantum-number tree point to those values, once the state matrix is finalized.

The `norm` component is redefined if a common factor is extracted from all nodes.

```

<State matrices: public>≡
  public :: state_matrix_t

<State matrices: types>+≡
  type :: state_matrix_t
    private
    type(node_t), pointer :: root => null ()
    integer :: depth = 0
    integer :: n_matrix_elements = 0
    logical :: leaf_nodes_store_values = .false.
    integer :: n_counters = 0
    complex(default), dimension(:), allocatable :: me
    real(default) :: norm = 1
  contains
    <State matrices: state matrix: TBP>
  end type state_matrix_t
```

This initializer allocates the root node but does not fill anything. We declare whether values are stored within the nodes during state-matrix construction, and how many counters should be maintained (default: none).

```

<State matrices: state matrix: TBP>≡
  procedure :: init => state_matrix_init

<State matrices: procedures>+≡
  subroutine state_matrix_init (state, store_values, n_counters)
    class(state_matrix_t), intent(out) :: state
    logical, intent(in), optional :: store_values
    integer, intent(in), optional :: n_counters
    allocate (state%root)
    if (present (store_values)) &
      state%leaf_nodes_store_values = store_values
    if (present (n_counters)) state%n_counters = n_counters
  end subroutine state_matrix_init
```

This recursively deletes all children of the root node, restoring the initial state. The matrix element array is not finalized, since it does not contain physical entries, just pointers.

```

<State matrices: state matrix: TBP>+≡
  procedure :: final => state_matrix_final
```

```

⟨State matrices: procedures⟩+≡
    subroutine state_matrix_final (state)
        class(state_matrix_t), intent(inout) :: state
        if (allocated (state%me))  deallocate (state%me)
        if (associated (state%root))  call node_delete (state%root)
        state%depth = 0
        state%n_matrix_elements = 0
    end subroutine state_matrix_final

```

Output: Present the tree as a nested list with appropriate indentation.

```

⟨State matrices: state matrix: TBP⟩+≡
    procedure :: write => state_matrix_write
⟨State matrices: procedures⟩+≡
    subroutine state_matrix_write (state, unit, write_value_list, &
        verbose, col_verbose, testflag)
        class(state_matrix_t), intent(in) :: state
        logical, intent(in), optional :: write_value_list, verbose, col_verbose
        logical, intent(in), optional :: testflag
        integer, intent(in), optional :: unit
        complex(default) :: me_dum
        character(len=7) :: fmt
        integer :: u
        integer :: i
        call pac_fmt (fmt, FMT_19, FMT_17, testflag)
        u = given_output_unit (unit);  if (u < 0)  return
        write (u, "(1x,A" // fmt // ")") "State matrix:  norm = ", state%norm
        if (associated (state%root)) then
            if (allocated (state%me)) then
                call node_write_rec (state%root, state%me, verbose=verbose, &
                    indent=1, unit=u, col_verbose=col_verbose, testflag=testflag)
            else
                call node_write_rec (state%root, verbose=verbose, indent=1, &
                    unit=u, col_verbose=col_verbose, testflag=testflag)
            end if
        end if
        if (present (write_value_list)) then
            if (write_value_list .and. allocated (state%me)) then
                do i = 1, size (state%me)
                    write (u, "(1x,I0,A)", advance="no") i, ":"
                    me_dum = state%me(i)
                    if (real(state%me(i)) == -real(state%me(i))) then
                        me_dum = &
                            cmplx (0._default, aimag(me_dum), kind=default)
                    end if

### Properties of the quantum state

A state is defined if its root is allocated:

```

<State matrices: state matrix: TBP>+≡
procedure :: is_defined => state_matrix_is_defined
<State matrices: procedures>+≡
elemental function state_matrix_is_defined (state) result (defined)
  logical :: defined
  class(state_matrix_t), intent(in) :: state

```

```

    defined = associated (state%root)
end function state_matrix_is_defined

```

A state is empty if its depth is zero:

```

<State matrices: state matrix: TBP>+≡
    procedure :: is_empty => state_matrix_is_empty
<State matrices: procedures>+≡
    elemental function state_matrix_is_empty (state) result (flag)
        logical :: flag
        class(state_matrix_t), intent(in) :: state
        flag = state%depth == 0
    end function state_matrix_is_empty

```

Return the number of matrix-element values.

```

<State matrices: state matrix: TBP>+≡
    procedure :: get_n_matrix_elements => state_matrix_get_n_matrix_elements
<State matrices: procedures>+≡
    function state_matrix_get_n_matrix_elements (state) result (n)
        integer :: n
        class(state_matrix_t), intent(in) :: state
        n = state%n_matrix_elements
    end function state_matrix_get_n_matrix_elements

```

Return the number of leaves. This can be larger than the number of independent matrix elements.

```

<State matrices: state matrix: TBP>+≡
    procedure :: get_n_leaves => state_matrix_get_n_leaves
<State matrices: procedures>+≡
    function state_matrix_get_n_leaves (state) result (n)
        integer :: n
        class(state_matrix_t), intent(in) :: state
        type(state_iterator_t) :: it
        n = 0
        call it%init (state)
        do while (it%is_valid ())
            n = n + 1
            call it%advance ()
        end do
    end function state_matrix_get_n_leaves

```

Return the depth:

```

<State matrices: state matrix: TBP>+≡
    procedure :: get_depth => state_matrix_get_depth
<State matrices: procedures>+≡
    function state_matrix_get_depth (state) result (depth)
        integer :: depth
        class(state_matrix_t), intent(in) :: state
        depth = state%depth
    end function state_matrix_get_depth

```

Return the norm:

```

⟨State matrices: state matrix: TBP⟩+≡
    procedure :: get_norm => state_matrix_get_norm
⟨State matrices: procedures⟩+≡
    function state_matrix_get_norm (state) result (norm)
        real(default) :: norm
        class(state_matrix_t), intent(in) :: state
        norm = state%norm
    end function state_matrix_get_norm

```

### Retrieving contents

Return the quantum number array, using an index. We have to scan the state matrix since there is no shortcut.

```

⟨State matrices: state matrix: TBP⟩+≡
    procedure :: get_quantum_numbers => state_matrix_get_quantum_numbers
⟨State matrices: procedures⟩+≡
    function state_matrix_get_quantum_numbers (state, i) result (qn)
        class(state_matrix_t), intent(in), target :: state
        integer, intent(in) :: i
        type(quantum_numbers_t), dimension(state%depth) :: qn
        type(state_iterator_t) :: it
        integer :: k
        k = 0
        call it%init (state)
        do while (it%is_valid ())
            k = k + 1
            if (k == i) then
                qn = it%get_quantum_numbers ()
                return
            end if
            call it%advance ()
        end do
    end function state_matrix_get_quantum_numbers

```

Return a single matrix element using its index. Works only if the shortcut array is allocated.

```

⟨State matrices: state matrix: TBP⟩+≡
    procedure :: get_matrix_element => state_matrix_get_matrix_element
⟨State matrices: procedures⟩+≡
    function state_matrix_get_matrix_element (state, i) result (me)
        complex(default) :: me
        class(state_matrix_t), intent(in) :: state
        integer, intent(in) :: i
        if (allocated (state%me)) then
            me = state%me(i)
        else
            me = 0
        end if
    end function state_matrix_get_matrix_element

```

Return the color index with maximum absolute value that is present within the state matrix.

```
(State matrices: state matrix: TBP) +≡
    procedure :: get_max_color_value => state_matrix_get_max_color_value
(State matrices: procedures) +≡
    function state_matrix_get_max_color_value (state) result (cmax)
        integer :: cmax
        class(state_matrix_t), intent(in) :: state
        if (associated (state%root)) then
            cmax = node_get_max_color_value (state%root)
        else
            cmax = 0
        end if
    contains
        recursive function node_get_max_color_value (node) result (cmax)
            integer :: cmax
            type(node_t), intent(in), target :: node
            type(node_t), pointer :: current
            cmax = quantum_numbers_get_max_color_value (node%qn)
            current => node%child_first
            do while (associated (current))
                cmax = max (cmax, node_get_max_color_value (current))
                current => current%next
            end do
        end function node_get_max_color_value
    end function state_matrix_get_max_color_value
```

### Building the quantum state

The procedure generates a branch associated to the input array of quantum numbers. If the branch exists already, it is used.

Optionally, we set the matrix-element index, a value (which may be added to the previous one), and increment one of the possible counters. We may also return the matrix element index of the current node.

```
(State matrices: state matrix: TBP) +≡
    procedure :: add_state => state_matrix_add_state
(State matrices: procedures) +≡
    subroutine state_matrix_add_state &
        (state, qn, index, value, sum_values, counter_index, me_index)
        class(state_matrix_t), intent(inout) :: state
        type(quantum_numbers_t), dimension(:), intent(in) :: qn
        integer, intent(in), optional :: index
        complex(default), intent(in), optional :: value
        logical, intent(in), optional :: sum_values
        integer, intent(in), optional :: counter_index
        integer, intent(out), optional :: me_index
        logical :: set_index, get_index, add
        set_index = present (index)
        get_index = present (me_index)
        add = .false.; if (present (sum_values)) add = sum_values
        if (state%depth == 0) then
```

```

state%depth = size (qn)

                    child%me_count = 0
                end if
                child%me_count(counter_index) = child%me_count(counter_index) + 1
            end if
            if (present (value)) then
                if (add) then
                    child%me = child%me + value
                else
                    child%me = value
                end if
            end if
        case (2:)
            call node_make_branch (child, qn(2:))
        end select
    end subroutine node_make_branch
end subroutine state_matrix_add_state

```

Remove irrelevant flavor/color/helicity labels and the corresponding branchings. The masks indicate which particles are affected; the masks length should coincide with the depth of the trie (without the root node). Recursively scan the whole tree, starting from the leaf nodes and working up to the root node. If a mask entry is set for the current tree level, scan the children there. For each child within that level make a new empty branch where the masked quantum number is undefined. Then recursively combine all following children with matching quantum number into this new node and move on.

```
<State matrices: state matrix: TBP>+≡
procedure :: collapse => state_matrix_collapse
<State matrices: procedures>+≡
subroutine state_matrix_collapse (state, mask)
  class(state_matrix_t), intent(inout) :: state
  type(quantum_numbers_mask_t), dimension(:), intent(in) :: mask
  type(state_matrix_t) :: red_state
  if (state%is_defined ()) then
    call state%reduce (mask, red_state)
    call state%final ()
    state = red_state
  end if
end subroutine state_matrix_collapse
```

Transform the given state matrix into a reduced state matrix where some quantum numbers are removed, as indicated by the mask. The procedure creates a new state matrix, so the old one can be deleted after this if it is no longer used.

```
<State matrices: state matrix: TBP>+≡
procedure :: reduce => state_matrix_reduce
<State matrices: procedures>+≡
subroutine state_matrix_reduce (state, mask, red_state)
  class(state_matrix_t), intent(in), target :: state
  type(quantum_numbers_mask_t), dimension(:), intent(in) :: mask
  type(state_matrix_t), intent(out) :: red_state
  type(state_iterator_t) :: it
  type(quantum_numbers_t), dimension(size(mask)) :: qn
  call red_state%init ()
  call it%init (state)
  do while (it%is_valid ())
    qn = it%get_quantum_numbers ()
    call qn%undefine (mask)
    call red_state%add_state (qn)
    call it%advance ()
  end do
end subroutine state_matrix_reduce
```

This subroutine sets up the matrix-element array. The leaf nodes acquire the index values that point to the appropriate matrix-element entry.

We recursively scan the trie. Once we arrive at a leaf node, the index is increased and associated to that node. Finally, we allocate the matrix-element array with the appropriate size.

If matrix element values are temporarily stored within the leaf nodes, we scan the state again and transfer them to the matrix-element array.

```
(State matrices: state matrix: TBP) +≡
    procedure :: freeze => state_matrix_freeze
(State matrices: procedures) +≡
    subroutine state_matrix_freeze (state)
        class(state_matrix_t), intent(inout), target :: state
        type(state_iterator_t) :: it
        if (associated (state%root)) then
            if (allocated (state%me)) deallocate (state%me)
            allocate (state%me (state%n_matrix_elements))
            state%me = 0
        end if
        if (state%leaf_nodes_store_values) then
            call it%init (state)
            do while (it%is_valid ())
                state%me(it%get_me_index ()) = it%get_matrix_element ()
                call it%advance ()
            end do
            state%leaf_nodes_store_values = .false.
        end if
    end subroutine state_matrix_freeze
```

### Direct access to the value array

Several methods for setting a value directly are summarized in this generic:

```
(State matrices: state matrix: TBP) +≡
    generic :: set_matrix_element => set_matrix_element_qn
    generic :: set_matrix_element => set_matrix_element_all
    generic :: set_matrix_element => set_matrix_element_array
    generic :: set_matrix_element => set_matrix_element_single
    generic :: set_matrix_element => set_matrix_element_clone
    procedure :: set_matrix_element_qn => state_matrix_set_matrix_element_qn
    procedure :: set_matrix_element_all => state_matrix_set_matrix_element_all
    procedure :: set_matrix_element_array => &
        state_matrix_set_matrix_element_array
    procedure :: set_matrix_element_single => &
        state_matrix_set_matrix_element_single
    procedure :: set_matrix_element_clone => &
        state_matrix_set_matrix_element_clone
```

Set a value that corresponds to a quantum number array:

```
(State matrices: procedures) +≡
    subroutine state_matrix_set_matrix_element_qn (state, qn, value)
        class(state_matrix_t), intent(inout) :: state
        type(quantum_numbers_t), dimension(:), intent(in) :: qn
        complex(default), intent(in) :: value
        type(state_iterator_t) :: it
        if (.not. allocated (it%state%me)) then
            allocate (it%state%me (size(qn)))
        end if
        call it%init (state)
```

```

do while (it%is_valid ())
    if (all (qn == it%get_quantum_numbers ())) then
        call it%set_matrix_element (value)
        return
    end if
    call it%advance ()
end do
end subroutine state_matrix_set_matrix_element_qn

```

Set all matrix elements to a single value

*(State matrices: procedures)*+≡

```

subroutine state_matrix_set_matrix_element_all (state, value)
    class(state_matrix_t), intent(inout) :: state
    complex(default), intent(in) :: value
    if (.not. allocated (state%me)) then
        allocate (state%me (state%n_matrix_elements))
    end if
    state%me = value
end subroutine state_matrix_set_matrix_element_all

```

Set the matrix-element array directly.

*(State matrices: procedures)*+≡

```

subroutine state_matrix_set_matrix_element_array (state, value)
    class(state_matrix_t), intent(inout) :: state
    complex(default), dimension(:), intent(in) :: value
    if (.not. allocated (state%me)) then
        allocate (state%me (size (value)))
    end if
    state%me = value
end subroutine state_matrix_set_matrix_element_array

pure subroutine state_matrix_set_matrix_element_single (state, i, value)
    class(state_matrix_t), intent(inout) :: state
    integer, intent(in) :: i
    complex(default), intent(in) :: value
    if (.not. allocated (state%me)) then
        allocate (state%me (state%n_matrix_elements))
    end if
    state%me(i) = value
end subroutine state_matrix_set_matrix_element_single

```

Clone the matrix elements from another (matching) state matrix.

*(State matrices: procedures)*+≡

```

subroutine state_matrix_set_matrix_element_clone (state, state1)
    class(state_matrix_t), intent(inout) :: state
    type(state_matrix_t), intent(in) :: state1
    if (.not. allocated (state1%me)) return
    if (.not. allocated (state%me)) allocate (state%me (size (state1%me)))
    state%me = state1%me
end subroutine state_matrix_set_matrix_element_clone

```

```

Add a value to a matrix element
⟨State matrices: state matrix: TBP⟩+≡
    procedure :: add_to_matrix_element => state_matrix_add_to_matrix_element
⟨State matrices: procedures⟩+≡
    subroutine state_matrix_add_to_matrix_element (state, i, value)
        class(state_matrix_t), intent(inout) :: state
        integer, intent(in) :: i
        complex(default), intent(in) :: value
        state%me(i) = state%me(i) + value
    end subroutine state_matrix_add_to_matrix_element

```

### 11.1.3 State iterators

Accessing the quantum state from outside is best done using a specialized iterator, i.e., a pointer to a particular branch of the quantum state trie. Technically, the iterator contains a pointer to a leaf node, but via parent pointers it allows to access the whole branch where the leaf is attached. For quick access, we also keep the branch depth (which is assumed to be universal for a quantum state).

```

⟨State matrices: public⟩+≡
    public :: state_iterator_t
⟨State matrices: types⟩+≡
    type :: state_iterator_t
        private
        integer :: depth = 0
        type(state_matrix_t), pointer :: state => null ()
        type(node_t), pointer :: node => null ()
    contains
        ⟨State matrices: state iterator: TBP⟩
    end type state_iterator_t

```

The initializer: Point at the first branch. Note that this cannot be pure, thus not be elemental, because the iterator can be used to manipulate data in the state matrix.

```

⟨State matrices: state iterator: TBP⟩≡
    procedure :: init => state_iterator_init
⟨State matrices: procedures⟩+≡
    subroutine state_iterator_init (it, state)
        class(state_iterator_t), intent(out) :: it
        type(state_matrix_t), intent(in), target :: state
        it%state => state
        it%depth = state%depth
        if (state%is_defined ()) then
            it%node => state%root
            do while (associated (it%node%child_first))
                it%node => it%node%child_first
            end do
        else
            it%node => null ()
        end if

```

```
end subroutine state_iterator_init
```

Go forward. Recursively programmed: if the next node does not exist, go back to the parent node and look at its successor (if present), etc.

There is a possible pitfall in the implementation: If the dummy pointer argument to the `find_next` routine is used directly, we still get the correct result for the iterator, but calling the recursion on `node%parent` means that we manipulate a parent pointer in the original state in addition to the iterator. Making a local copy of the pointer avoids this. Using pointer intent would be helpful, but we do not yet rely on this F2003 feature.

```
<State matrices: state iterator: TBP>+≡
    procedure :: advance => state_iterator_advance
<State matrices: procedures>+≡
    subroutine state_iterator_advance (it)
        class(state_iterator_t), intent(inout) :: it
        call find_next (it%node)
        contains
            recursive subroutine find_next (node_in)
                type(node_t), intent(in), target :: node_in
                type(node_t), pointer :: node
                node => node_in
                if (associated (node%next)) then
                    node => node%next
                    do while (associated (node%child_first))
                        node => node%child_first
                    end do
                    it%node => node
                else if (associated (node%parent)) then
                    call find_next (node%parent)
                else
                    it%node => null ()
                end if
            end subroutine find_next
    end subroutine state_iterator_advance
```

If all has been scanned, the iterator is at an undefined state. Check for this:

```
<State matrices: state iterator: TBP>+≡
    procedure :: is_valid => state_iterator_is_valid
<State matrices: procedures>+≡
    function state_iterator_is_valid (it) result (defined)
        logical :: defined
        class(state_iterator_t), intent(in) :: it
        defined = associated (it%node)
    end function state_iterator_is_valid
```

Return the matrix-element index that corresponds to the current node

```
<State matrices: state iterator: TBP>+≡
    procedure :: get_me_index => state_iterator_get_me_index
```

```

⟨State matrices: procedures⟩+≡
    function state_iterator_get_me_index (it) result (n)
        integer :: n
        class(state_iterator_t), intent(in) :: it
        n = it%node%me_index
    end function state_iterator_get_me_index

```

Return the number of times this quantum-number state has been added (noting that it is physically inserted only the first time). Note that for each state, there is an array of counters.

```

⟨State matrices: state iterator: TBP⟩+≡
    procedure :: get_me_count => state_iterator_get_me_count

⟨State matrices: procedures⟩+≡
    function state_iterator_get_me_count (it) result (n)
        integer, dimension(:), allocatable :: n
        class(state_iterator_t), intent(in) :: it
        if (allocated (it%node%me_count)) then
            allocate (n (size (it%node%me_count)))
            n = it%node%me_count
        else
            allocate (n (0))
        end if
    end function state_iterator_get_me_count

```

Use the iterator to retrieve quantum-number information:

```

⟨State matrices: state iterator: TBP⟩+≡
    generic :: get_quantum_numbers => get_qn_multi, get_qn_slice, &
               get_qn_range, get_qn_single
    generic :: get_flavor => get_flv_multi, get_flv_slice, &
               get_flv_range, get_flv_single
    generic :: get_color => get_col_multi, get_col_slice, &
               get_col_range, get_col_single
    generic :: get_helicity => get_hel_multi, get_hel_slice, &
               get_hel_range, get_hel_single

⟨State matrices: state iterator: TBP⟩+≡
    procedure :: get_qn_multi => state_iterator_get_qn_multi
    procedure :: get_qn_slice => state_iterator_get_qn_slice
    procedure :: get_qn_range => state_iterator_get_qn_range
    procedure :: get_qn_single => state_iterator_get_qn_single
    procedure :: get_flv_multi => state_iterator_get_flv_multi
    procedure :: get_flv_slice => state_iterator_get_flv_slice
    procedure :: get_flv_range => state_iterator_get_flv_range
    procedure :: get_flv_single => state_iterator_get_flv_single
    procedure :: get_col_multi => state_iterator_get_col_multi
    procedure :: get_col_slice => state_iterator_get_col_slice
    procedure :: get_col_range => state_iterator_get_col_range
    procedure :: get_col_single => state_iterator_get_col_single
    procedure :: get_hel_multi => state_iterator_get_hel_multi
    procedure :: get_hel_slice => state_iterator_get_hel_slice
    procedure :: get_hel_range => state_iterator_get_hel_range
    procedure :: get_hel_single => state_iterator_get_hel_single

```

These versions return the whole quantum number array

```
<State matrices: procedures>+≡
    function state_iterator_get_qn_multi (it) result (qn)
        class(state_iterator_t), intent(in) :: it
        type(quantum_numbers_t), dimension(it%depth) :: qn

    do j = 1, size (qn_con, 2)
        call state%add_state (qn_con(:,j), index = me_index(i))
    end do
end do
end subroutine state_matrix_add_color_contractions

```

This procedure merges two state matrices of equal depth. For each quantum number (flavor, color, helicity), we take the entry from the first argument where defined, otherwise the second one. (If both are defined, we get an off-diagonal matrix.) The resulting trie combines the information of the input tries in all possible ways. Note that values are ignored, all values in the result are zero.

```

<State matrices: public>+≡
public :: merge_state_matrices
<State matrices: procedures>+≡
subroutine merge_state_matrices (state1, state2, state3)
    type(state_matrix_t), intent(in), target :: state1, state2

    call state3%freeze ()
end subroutine merge_state_matrices

```

Multiply matrix elements from two state matrices. Choose the elements as given by the integer index arrays, multiply them and store the sum of products in the indicated matrix element. The suffixes mean: c=conjugate first factor; f=include weighting factor.

Note that the `dot_product` intrinsic function conjugates its first complex argument. This is intended for the `c` suffix case, but must be reverted for the plain-product case.

We provide analogous subroutines for just summing over state matrix entries. The `evaluate_sum` variant includes the state-matrix norm in the evaluation, the `evaluate_me_sum` takes into account just the matrix elements proper.

```
(State matrices: state matrix: TBP)+≡
procedure :: evaluate_product => state_matrix_evaluate_product
procedure :: evaluate_product_cf => state_matrix_evaluate_product_cf
procedure :: evaluate_square_c => state_matrix_evaluate_square_c
procedure :: evaluate_sum => state_matrix_evaluate_sum
procedure :: evaluate_me_sum => state_matrix_evaluate_me_sum

(State matrices: procedures)+≡
pure subroutine state_matrix_evaluate_product &
    (state, i, state1, state2, index1, index2)
    class(state_matrix_t), intent(inout) :: state

    integer, intent(in) :: i
    type(state_matrix_t), intent(in) :: state1
    integer, dimension(:), intent(in) :: index1
    state%me(i) = sum (state1%me(index1))
end subroutine state_matrix_evaluate_me_sum

```

Outer product (of states and matrix elements):

```

<State matrices: public>+≡
    public :: outer_multiply
<State matrices: interfaces>+≡
    interface outer_multiply
        module procedure outer_multiply_pair
        module procedure outer_multiply_array
    end interface

```

This procedure constructs the outer product of two state matrices.

```

<State matrices: procedures>+≡
    subroutine outer_multiply_pair (state1, state2, state3)
        type(state_matrix_t), intent(in), target :: state1, state2
        type(state_matrix_t), intent(out) :: state3
        type(state_iterator_t) :: it1, it2
        type(quantum_numbers_t), dimension(state1%depth) :: qn1
        type(quantum_numbers_t), dimension(state2%depth) :: qn2
        type(quantum_numbers_t), dimension(state1%depth+state2%depth) :: qn3
        complex(default) :: val1, val2
        call state3%init (store_values=.true.)
        call it1%init (state1)
        do while (it1%is_valid ())
            qn1 = it1%get_quantum_numbers ()
            val1 = it1%get_matrix_element ()
            call it2%init (state2)
            do while (it2%is_valid ())
                qn2 = it2%get_quantum_numbers ()
                val2 = it2%get_matrix_element ()
                qn3(:state1%depth) = qn1
                qn3(state1%depth+1:) = qn2
                call state3%add_state (qn3, value=val1 * val2)
                call it2%advance ()
            end do
            call it1%advance ()
        end do
        call state3%freeze ()
    end subroutine outer_multiply_pair

```

This executes the above routine iteratively for an arbitrary number of state matrices.

```
(State matrices: procedures)+≡
subroutine outer_multiply_array (state_in, state_out)
    type(state_matrix_t), dimension(:), intent(in), target :: state_in
    type(state_matrix_t), intent(out) :: state_out
    type(state_matrix_t), dimension(:), allocatable, target :: state_tmp

        do i = 1, size(state_tmp)
            call state_tmp(i)%final ()
        end do
    end select
end subroutine outer_multiply_array
```

### 11.1.5 Factorization

In physical events, the state matrix is factorized into single-particle state matrices. This is essentially a measurement.

In a simulation, we select one particular branch of the state matrix with a probability that is determined by the matrix elements at the leaves. (This makes sense only if the state matrix represents a squared amplitude.) The selection is based on a (random) value  $x$  between 0 and one that is provided as the third argument.

For flavor and color, we select a unique value for each particle. For polarization, we have three options (modes). Option 1 is to drop helicity information altogether and sum over all diagonal helicities. Option 2 is to select a unique diagonal helicity in the same way as flavor and color. Option 3 is, for each particle, to trace over all remaining helicities in order to obtain an array of independent single-particle helicity matrices.

Only branches that match the given quantum-number array `qn_in`, if present, are considered. For this array, color is ignored.

If the optional `correlated_state` is provided, it is assigned the correlated density matrix for the selected flavor-color branch, so multi-particle spin correlations remain available even if they are dropped in the single-particle density matrices.

The algorithm is as follows: First, we determine the normalization by summing over all diagonal matrix elements. In a second scan, we select one of the diagonal matrix elements by a cumulative comparison with the normalized random number. In the corresponding quantum number array, we undefine the helicity entries. Then, we scan the third time. For each branch that matches the selected quantum number array (i.e., definite flavor and color, arbitrary helicity), we determine its contribution to any of the single-particle state matrices. The matrix-element value is added if all other quantum numbers are diagonal, while the helicity of the chosen particle may be arbitrary; this helicity determines the branch in the single-particle state.

As a result, flavor and color quantum numbers are selected with the correct probability. Within this subset of states, each single-particle state matrix results from tracing over all other particles. Note that the single-particle state matrices are not normalized.

The flag `ok` is set to false if the matrix element sum is zero, so factorization is not possible. This can happen if an event did not pass cuts.

### Quantum-number matching

This feature allows us to check whether a given string of PDG values matches, in any ordering, any of the flavor combinations that the state matrix provides. We will also request the permutation of the successful match.

This type provides an account of the state's flavor content. We store all flavor combinations, as `pdg` values, in an array, assuming that the length is uniform.

We check only the entries selected by `mask_match`. Among those, only the entries selected by `mask_sort` are sorted and thus matched without respecting array element order. The entries that correspond to a true value in the associated `mask` are sorted. The mapping from the original state to the sorted state is given by the index array `map`.

```

<State matrices: public>+≡
public :: state_flv_content_t
<State matrices: types>+≡
type :: state_flv_content_t
private

```

```

## 11.2 Interactions

This module defines the `interaction_t` type. It is an extension of the `state_matrix_t` type.

The state matrix is a representation of a multi-particle density matrix. It implements all possible flavor, color, and quantum-number assignments of the entries in a generic density matrix, and it can hold a complex matrix element for each entry. (Note that this matrix can hold non-diagonal entries in color and helicity space.) The `interaction_t` object associates this with a list of momenta, such that the whole object represents a multi-particle state.

The `interaction_t` holds information about which particles are incoming, virtual (i.e., kept for the records), or outgoing. Each particle can be associated to a source within another interaction. This allows us to automatically fill those interaction momenta which have been computed or defined elsewhere. It also contains internal parent-child relations and flags for (virtual) particles which are to be treated as resonances.

A quantum-number mask array summarizes, for each particle within the interaction, the treatment of flavor, color, or helicity (expose or ignore). A list of locks states which particles are bound to have an identical quantum-number mask. This is useful when the mask is changed at one place.

```
<interactions.f90>≡  
<File header>  
  
module interactions  
  
<Use kinds>  
  use io_units  
  use diagnostics  
  use sorting

<Interactions: interfaces>  
  
contains  
  
<Interactions: procedures>  
  
end module interactions
```

### 11.2.1 External interaction links

Each particle in an interaction can have a link to a corresponding particle in another interaction. This allows to fetch the momenta of incoming or virtual particles from the interaction where they are defined. The link object consists of a pointer to the interaction and an index.

```
(Interactions: types)≡
  type :: external_link_t
    private
      type(interaction_t), pointer :: int => null ()
      integer :: i
    end type external_link_t
```

Set an external link.

```
(Interactions: procedures)≡
  subroutine external_link_set (link, int, i)
    type(external_link_t), intent(out) :: link
    type(interaction_t), target, intent(in) :: int
    integer, intent(in) :: i
    if (i /= 0) then
      link%int => int
      link%i = i
    end if
  end subroutine external_link_set
```

Reassign an external link to a new interaction (which should be an image of the original target).

```
(Interactions: procedures)+≡
  subroutine external_link_reassign (link, int_src, int_target)
    type(external_link_t), intent(inout) :: link
    type(interaction_t), intent(in) :: int_src
    type(interaction_t), intent(in), target :: int_target
    if (associated (link%int)) then
      if (link%int%tag == int_src%tag) link%int => int_target
    end if
  end subroutine external_link_reassign
```

Return true if the link is set

```
(Interactions: procedures)+≡
  function external_link_is_set (link) result (flag)
    logical :: flag
    type(external_link_t), intent(in) :: link
    flag = associated (link%int)
  end function external_link_is_set
```

Return the interaction pointer.

```
(Interactions: public)≡
  public :: external_link_get_ptr
  (Interactions: procedures)+≡
    function external_link_get_ptr (link) result (int)
      type(interaction_t), pointer :: int
```

```

    type(external_link_t), intent(in) :: link
    int => link%int
end function external_link_get_ptr

```

Return the index within that interaction

```

<Interactions: public>+≡
public :: external_link_get_index
<Interactions: procedures>+≡
function external_link_get_index (link) result (i)
    integer :: i
    type(external_link_t), intent(in) :: link
    i = link%i
end function external_link_get_index

```

Return a pointer to the momentum of the corresponding particle. If there is no association, return a null pointer.

```

<Interactions: procedures>+≡
function external_link_get_momentum_ptr (link) result (p)
    type(vector4_t), pointer :: p
    type(external_link_t), intent(in) :: link
    if (associated (link%int)) then
        p => link%int%p(link%i)
    else
        p => null ()
    end if
end function external_link_get_momentum_ptr

```

### 11.2.2 Internal relations

In addition to the external links, particles within the interaction have parent-child relations. Here, more than one link is possible, and we set up an array.

```

<Interactions: types>+≡
type :: internal_link_list_t
    private
    integer :: length = 0
    integer, dimension(:), allocatable :: link
contains
    <Interactions: internal link list: TBP>
end type internal_link_list_t

```

Output, non-advancing.

```

<Interactions: internal link list: TBP>≡
procedure :: write => internal_link_list_write
<Interactions: procedures>+≡
subroutine internal_link_list_write (object, unit)
    class(internal_link_list_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u, i
    u = given_output_unit (unit)

```

```

do i = 1, object%length
    write (u, "(1x,I0)", advance="no") object%link(i)
end do
end subroutine internal_link_list_write

```

Append an item. Start with an array size of 2 and double the size if necessary.

Make sure that the indices are stored in ascending order. To this end, shift the existing entries right, starting from the end, as long as they are larger than the new entry.

```

⟨Interactions: internal link list: TBP⟩+≡
procedure :: append => internal_link_list_append
⟨Interactions: procedures⟩+≡
subroutine internal_link_list_append (link_list, link)
    class(internal_link_list_t), intent(inout) :: link_list
    integer, intent(in) :: link
    integer :: l, j
    integer, dimension(:), allocatable :: tmp
    l = link_list%length
    if (allocated (link_list%link)) then
        if (l == size (link_list%link)) then
            allocate (tmp (2 * l))
            tmp(:l) = link_list%link
            call move_alloc (from = tmp, to = link_list%link)
        end if
    else
        allocate (link_list%link (2))
    end if
    link_list%link(l+1) = link
    SHIFT_LINK_IN_PLACE: do j = l, 1, -1
        if (link >= link_list%link(j)) then
            exit SHIFT_LINK_IN_PLACE
        else
            link_list%link(j+1) = link_list%link(j)
            link_list%link(j) = link
        end if
    end do SHIFT_LINK_IN_PLACE
    link_list%length = l + 1
end subroutine internal_link_list_append

```

Return true if the link list is nonempty:

```

⟨Interactions: internal link list: TBP⟩+≡
procedure :: has_entries => internal_link_list_has_entries
⟨Interactions: procedures⟩+≡
function internal_link_list_has_entries (link_list) result (flag)
    class(internal_link_list_t), intent(in) :: link_list
    logical :: flag
    flag = link_list%length > 0
end function internal_link_list_has_entries

```

Return the list length

```

⟨Interactions: internal link list: TBP⟩+≡
procedure :: get_length => internal_link_list_get_length

```

```

### 11.2.3 The interaction type

An interaction is an entangled system of particles. Thus, the interaction object consists of two parts: the subevent, and the quantum state which technically is a trie. The subnode levels beyond the trie root node are in correspondence to the subevent, so both should be traversed in parallel.

The subevent is implemented as an allocatable array of four-momenta. The first `n_in` particles are incoming, `n_vir` particles in-between can be kept for bookkeeping, and the last `n_out` particles are outgoing.

Distinct interactions are linked by their particles: for each particle, we have the possibility of links to corresponding particles in other interactions. Furthermore, for bookkeeping purposes we have a self-link array `relations` where the parent-child relations are kept, and a flag array `resonant` which is set for an intermediate resonance.

Each momentum is associated with masks for flavor, color, and helicity. If a mask entry is set, the associated quantum number is to be ignored for that particle. If any mask has changed, the flag `update` is set.

We can have particle pairs locked together. If this is the case, the corresponding mask entries are bound to be equal. This is useful for particles that go through the interaction.

The interaction tag serves bookkeeping purposes. In particular, it identifies links in printout.

```

⟨Interactions: public⟩+≡
    public :: interaction_t
⟨Interactions: types⟩+≡
    type :: interaction_t
        private

```

```

integer :: tag = 0
type(state_matrix_t) :: state_matrix
integer :: n_in = 0
integer :: n_vir = 0
integer :: n_out = 0
integer :: n_tot = 0
logical, dimension(:,), allocatable :: p_is_known
type(vector4_t), dimension(:,), allocatable :: p
type(external_link_t), dimension(:,), allocatable :: source
type(internal_link_list_t), dimension(:,), allocatable :: parents
type(internal_link_list_t), dimension(:,), allocatable :: children
logical, dimension(:,), allocatable :: resonant
type(quantum_numbers_mask_t), dimension(:,), allocatable :: mask
integer, dimension(:,), allocatable :: hel_lock
logical :: update_state_matrix = .false.
logical :: update_values = .false.
contains
<Interactions: interaction: TBP>
end type interaction_t

```

Initialize the particle array with a fixed size. The first `n_in` particles are incoming, the rest outgoing. Masks are optional. There is also an optional tag. The interaction still needs fixing the values, but that is to be done after all branches have been added.

Interaction tags are assigned consecutively, using a `saved` variable local to this procedure. If desired, we can provide a seed for the interaction tags. Such a seed should be positive. The default seed is one. `tag=0` indicates an empty interaction.

If `set_relations` is set and true, we establish parent-child relations for all incoming and outgoing particles. Virtual particles are skipped; this option is normally used only for interactions without virtual particles.

```

<Interactions: interaction: TBP>≡
procedure :: basic_init => interaction_init
<Interactions: procedures>+≡
subroutine interaction_init &
    (int, n_in, n_vir, n_out, &

```

#### 11.2.4 Methods inherited from the state matrix member

Until F2003 is standard, we cannot implement inheritance directly. Therefore, we need wrappers for “inherited” methods.

Make a new branch in the state matrix if it does not yet exist. This is not just a wrapper but it introduces the interaction mask: where a quantum number is masked, it is not transferred but set undefined. After this, the value array has to be updated.

```

<Interactions: interaction: TBP>+≡
procedure :: add_state => interaction_add_state
<Interactions: procedures>+≡
subroutine interaction_add_state &
    (int, qn, index, value, sum_values, counter_index, me_index)
class(interaction_t), intent(inout) :: int
type(quantum_numbers_t), dimension(:), intent(in) :: qn
integer, intent(in), optional :: index
complex(default), intent(in), optional :: value
logical, intent(in), optional :: sum_values
integer, intent(in), optional :: counter_index
integer, intent(out), optional :: me_index
type(quantum_numbers_t), dimension(size(qn)) :: qn_tmp
qn_tmp = qn
call qn_tmp%undefine (int%mask)
call int%state_matrix%add_state (qn_tmp, index, value, sum_values, &
    counter_index, me_index)
int%update_values = .true.
end subroutine interaction_add_state

```

Freeze the quantum state: First collapse the quantum state, i.e., remove quantum numbers if any mask has changed, then fix the array of value pointers.

```

<Interactions: interaction: TBP>+≡
procedure :: freeze => interaction_freeze

```

```

⟨Interactions: procedures⟩+≡
    subroutine interaction_freeze (int)
        class(interaction_t), intent(inout) :: int
        if (int%update_state_matrix) then
            call int%state_matrix%collapse (int%mask)
            int%update_state_matrix = .false.
            int%update_values = .true.
        end if
        if (int%update_values) then
            call int%state_matrix%freeze ()
            int%update_values = .false.
        end if
    end subroutine interaction_freeze

```

Return true if the state matrix is empty.

```

⟨Interactions: interaction: TBP⟩+≡
    procedure :: is_empty => interaction_is_empty
⟨Interactions: procedures⟩+≡
    function interaction_is_empty (int) result (flag)
        class(interaction_t), intent(in) :: int
        logical :: flag
        flag = int%state_matrix%is_empty ()
    end function interaction_is_empty

```

Get the number of values stored in the state matrix:

```

⟨Interactions: interaction: TBP⟩+≡
    procedure :: get_n_matrix_elements => &
                interaction_get_n_matrix_elements
⟨Interactions: procedures⟩+≡
    function interaction_get_n_matrix_elements (int) result (n)
        class(interaction_t), intent(in) :: int
        integer :: n
        n = int%state_matrix%get_n_matrix_elements ()
    end function interaction_get_n_matrix_elements

```

Get the norm of the state matrix (if the norm has been taken out, otherwise this would be unity).

```

⟨Interactions: interaction: TBP⟩+≡
    procedure :: get_norm => interaction_get_norm
⟨Interactions: procedures⟩+≡
    function interaction_get_norm (int) result (norm)
        real(default) :: norm
        class(interaction_t), intent(in) :: int
        norm = int%state_matrix%get_norm ()
    end function interaction_get_norm

```

Get the quantum number array that corresponds to a given index.

```

⟨Interactions: interaction: TBP⟩+≡
    procedure :: get_quantum_numbers => interaction_get_quantum_numbers

```

```

⟨Interactions: procedures⟩+≡
    function interaction_get_quantum_numbers (int, i) result (qn)
        class(interaction_t), intent(in), target :: int
        type(quantum_numbers_t), dimension(:), allocatable :: qn
        integer, intent(in) :: i
        allocate (qn (int%state_matrix%get_depth ()))
        qn = int%state_matrix%get_quantum_numbers (i)
    end function interaction_get_quantum_numbers

```

Get the matrix element that corresponds to a set of quantum numbers, a given index, or return the whole array.

```

⟨Interactions: interaction: TBP⟩+≡
    procedure :: get_matrix_element => interaction_get_matrix_element
⟨Interactions: procedures⟩+≡
    function interaction_get_matrix_element (int, i) result (me)
        class(interaction_t), intent(in) :: int
        complex(default) :: me
        integer, intent(in) :: i
        me = int%state_matrix%get_matrix_element (i)
    end function interaction_get_matrix_element

```

Set the complex value(s) stored in the quantum state.

```

⟨Interactions: interaction: TBP⟩+≡
    generic :: set_matrix_element => interaction_set_matrix_element_qn, &
               interaction_set_matrix_element_all, &
               interaction_set_matrix_element_array, &
               interaction_set_matrix_element_single, &
               interaction_set_matrix_element_clone
    procedure :: interaction_set_matrix_element_qn
    procedure :: interaction_set_matrix_element_all
    procedure :: interaction_set_matrix_element_array
    procedure :: interaction_set_matrix_element_single
    procedure :: interaction_set_matrix_element_clone

```

Indirect access via the quantum number array:

```

⟨Interactions: procedures⟩+≡
    subroutine interaction_set_matrix_element_qn (int, qn, val)
        class(interaction_t), intent(inout) :: int
        type(quantum_numbers_t), dimension(:), intent(in) :: qn
        complex(default), intent(in) :: val
        call int%state_matrix%set_matrix_element (qn, val)
    end subroutine interaction_set_matrix_element_qn

```

Set all entries of the matrix-element array to a given value.

```

⟨Interactions: procedures⟩+≡
    subroutine interaction_set_matrix_element_all (int, value)
        class(interaction_t), intent(inout) :: int
        complex(default), intent(in) :: value
        call int%state_matrix%set_matrix_element (value)
    end subroutine interaction_set_matrix_element_all

```

Set the matrix-element array directly.

```
(Interactions: procedures)+≡
    subroutine interaction_set_matrix_element_array (int, value)
        class(interaction_t), intent(inout) :: int
        complex(default), dimension(:), intent(in) :: value
        call int%state_matrix%set_matrix_element (value)
    end subroutine interaction_set_matrix_element_array

    pure subroutine interaction_set_matrix_element_single (int, i, value)
        class(interaction_t), intent(inout) :: int
        integer, intent(in) :: i
        complex(default), intent(in) :: value
        call int%state_matrix%set_matrix_element (i, value)
    end subroutine interaction_set_matrix_element_single
```

Clone from another (matching) interaction.

```
(Interactions: procedures)+≡
    subroutine interaction_set_matrix_element_clone (int, int1)
        class(interaction_t), intent(inout) :: int
        class(interaction_t), intent(in) :: int1
        call int%state_matrix%set_matrix_element (int1%state_matrix)
    end subroutine interaction_set_matrix_element_clone
```

Get the indices of any diagonal matrix elements.

```
(Interactions: interaction: TBP)+≡
    procedure :: get_diagonal_entries => interaction_get_diagonal_entries

(Interactions: procedures)+≡
    subroutine interaction_get_diagonal_entries (int, i)
        class(interaction_t), intent(in) :: int
        integer, dimension(:), allocatable, intent(out) :: i
        call int%state_matrix%get_diagonal_entries (i)
    end subroutine interaction_get_diagonal_entries
```

Renormalize the state matrix by its trace, if nonzero. The renormalization is reflected in the state-matrix norm.

```
(Interactions: interaction: TBP)+≡
    procedure :: normalize_by_trace => interaction_normalize_by_trace

(Interactions: procedures)+≡
    subroutine interaction_normalize_by_trace (int)
        class(interaction_t), intent(inout) :: int
        call int%state_matrix%normalize_by_trace ()
    end subroutine interaction_normalize_by_trace
```

Analogous, but renormalize by maximal (absolute) value.

```
(Interactions: interaction: TBP)+≡
    procedure :: normalize_by_max => interaction_normalize_by_max

(Interactions: procedures)+≡
    subroutine interaction_normalize_by_max (int)
        class(interaction_t), intent(inout) :: int
        call int%state_matrix%normalize_by_max ()
```

```
end subroutine interaction_normalize_by_max
```

Explicitly set the norm value (of the state matrix).

```
<Interactions: interaction: TBP>+≡  
    procedure :: set_norm => interaction_set_norm  
  
<Interactions: procedures>+≡  
    subroutine interaction_set_norm (int, norm)  
        class(interaction_t), intent(inout) :: int  
        real(default), intent(in) :: norm  
        call int%state_matrix%set_norm (norm)  
    end subroutine interaction_set_norm
```

Return the maximum absolute value of color indices.

```
<Interactions: interaction: TBP>+≡

            index_link = external_link_get_index (int%source(i))
            call int%set_momentum (int_link%p(index_link), i)
        end if
    end do
end subroutine interaction_receive_momenta

```

The inverse operation: Copy momenta back to the interactions linked to the current one.

```

⟨Interactions: public⟩+≡
public :: interaction_send_momenta
⟨Interactions: procedures⟩+≡
subroutine interaction_send_momenta (int)
    type(interaction_t), intent(in) :: int
    integer :: i, index_link
    type(interaction_t), pointer :: int_link
    do i = 1, int%n_tot
        if (external_link_is_set (int%source(i))) then
            int_link => external_link_get_ptr (int%source(i))
            index_link = external_link_get_index (int%source(i))
            call int_link%set_momentum (int%p(i), index_link)
        end if
    end do
end subroutine interaction_send_momenta

```

For numerical comparisons: pacify all momenta in an interaction.

```

⟨Interactions: public⟩+≡
public :: interaction_pacify_momenta
⟨Interactions: procedures⟩+≡
subroutine interaction_pacify_momenta (int, acc)
    type(interaction_t), intent(inout) :: int
    real(default), intent(in) :: acc

```

```

integer :: i
do i = 1, int%n_tot
    call pacify (int%p(i), acc)
end do
end subroutine interaction_pacify_momenta

```

### 11.2.8 Recovering connections

When creating an evaluator for two interactions, we have to know by which particles they are connected. The connection indices can be determined if we have two linked interactions. We assume that `int1` is the source and `int2` the target, so the connections of interest are stored within `int2`. A connection is found if either the source is `int1`, or the (ultimate) source of a particle within `int2` coincides with the (ultimate) source of a particle within `int1`. The result is an array of index pairs.

To make things simple, we scan the interaction twice, once for counting hits, then allocate the array, then scan again and store the connections.

The connections are scanned for `int2`, which has sources in `int1`. It may happen that the order of connections is interchanged (crossed). We require the indices in `int1` to be sorted, so we reorder both index arrays correspondingly before returning them. (After this, the indices in `int2` may be out of order.)

```

<Interactions: public>+≡
    public :: find_connections

<Interactions: procedures>+≡
    subroutine find_connections (int1, int2, n, connection_index)
        class(interaction_t), intent(in) :: int1, int2
        integer, intent(out) :: n
        integer, dimension(:, :, ), intent(out), allocatable :: connection_index
        integer, dimension(:, :, ), allocatable :: conn_index_tmp
        integer, dimension(:, ), allocatable :: ordering
        integer :: i, j, k
        type(external_link_t) :: link2, link1

```

### 11.3 Matrix element evaluation

The `evaluator_t` type is an extension of the `interaction_t` type. It represents either a density matrix as the square of a transition matrix element, or the product of two density matrices. Usually, some quantum numbers are summed over in the result.

The `interaction_t` subobject represents a multi-particle interaction with incoming, virtual, and outgoing particles and the associated (not necessarily diagonal) density matrix of quantum state. When the evaluator is initialized, this interaction is constructed from the input interaction(s).

In addition, the initialization process sets up a multiplication table. For each matrix element of the result, it states which matrix elements are to be taken from the input interaction(s), multiplied (optionally, with an additional weight factor) and summed over.

Eventually, to a processes we associate a chain of evaluators which are to be evaluated sequentially. The physical event and its matrix element value(s) can be extracted from the last evaluator in such a chain.

Evaluators are constructed only once (as long as this is possible) during an

initialization step. Then, for each event, momenta are computed and transferred among evaluators using the links within the interaction subobject. The multiplication tables enable fast evaluation of the result without looking at quantum numbers anymore.

```

    ⟨Evaluators: public⟩

    ⟨Evaluators: parameters⟩

    ⟨Evaluators: types⟩

    ⟨Evaluators: interfaces⟩

    contains

    ⟨Evaluators: procedures⟩

  end module evaluators

```

### 11.3.1 Array of pairings

The evaluator contains an array of `pairing_array` objects. This makes up the multiplication table.

Each pairing array contains two list of matrix element indices and a list of numerical factors. The matrix element indices correspond to the input interactions. The corresponding matrix elements are to be multiplied and optionally multiplied by a factor. The results are summed over to yield one specific matrix element of the result evaluator.

```

⟨Evaluators: types⟩≡
  type :: pairing_array_t
    integer, dimension(:,), allocatable :: i1, i2
    complex(default), dimension(:,), allocatable :: factor

```

```

end type pairing_array_t

⟨Evaluators: procedures⟩≡
elemental subroutine pairing_array_init (pa, n, has_i2, has_factor)
    type(pairing_array_t), intent(out) :: pa
    integer, intent(in) :: n
    logical, intent(in) :: has_i2, has_factor
    allocate (pa%i1 (n))
    if (has_i2) allocate (pa%i2 (n))
    if (has_factor) allocate (pa%factor (n))
end subroutine pairing_array_init

```

### 11.3.2 The evaluator type

Possible variants of evaluators:

```

⟨Evaluators: parameters⟩≡
integer, parameter :: &
    EVAL_UNDEFINED = 0, &
    EVAL_PRODUCT = 1, &
    EVAL_SQUARED_FLOWS = 2, &
    EVAL_SQUARE_WITH_COLOR_FACTORS = 3, &
    EVAL_COLOR_CONTRACTION = 4, &
    EVAL_IDENTITY = 5, &
    EVAL_QN_SUM = 6

```

The evaluator type contains the result interaction and an array of pairing lists, one for each matrix element in the result interaction.

```

⟨Evaluators: public⟩≡
public :: evaluator_t

⟨Evaluators: types⟩+≡
type, extends (interaction_t) :: evaluator_t
private
integer :: type = EVAL_UNDEFINED
class(interaction_t), pointer :: int_in1 => null ()
class(interaction_t), pointer :: int_in2 => null ()
type(pairing_array_t), dimension(:), allocatable :: pairing_array
contains
⟨Evaluators: evaluator: TBP⟩
end type evaluator_t

```

Output.

```

⟨Evaluators: evaluator: TBP⟩≡
procedure :: write => evaluator_write

⟨Evaluators: procedures⟩+≡
subroutine evaluator_write (eval, unit, &

### 11.3.3 Auxiliary structures for evaluator creation

Creating an evaluator that properly handles all quantum numbers requires some bookkeeping. In this section, we define several auxiliary types and methods that organize and simplify this task. More structures are defined within the specific initializers (as local types and internal subroutines).

These types are currently implemented in a partial object-oriented way: We define some basic methods for initialization etc. here, but the evaluator routines below do access their internals as well. This simplifies some things such as index addressing using array slices, at the expense of losing some clarity.

## Index mapping

Index mapping are abundant when constructing an evaluator. To have arrays of index mappings, we define this:

```
Evaluators: types +≡  
  type :: index_map_t  
    integer, dimension(:), allocatable :: entry  
  end type index_map_t
```

```
Evaluators: procedures +≡  
  elemental subroutine index_map_init (map, n)  
    type(index_map_t), intent(out) :: map  
    integer, intent(in) :: n  
    allocate (map%entry (n))  
  end subroutine index_map_init
```

```
Evaluators: procedures +≡  
  function index_map_exists (map) result (flag)  
    logical :: flag  
    type(index_map_t), intent(in) :: map  
    flag = allocated (map%entry)  
  end function index_map_exists
```

```
Evaluators: interfaces +≡  
  interface size  
    module procedure index_map_size  
  end interface
```

```
Evaluators: procedures +≡  
  function index_map_size (map) result (s)  
    integer :: s  
    type(index_map_t), intent(in) :: map  
    if (allocated (map%entry)) then  
      s = size (map%entry)  
    else  
      s = 0  
    end if  
  end function index_map_size
```

```
Evaluators: interfaces +≡  
  interface assignment(=)  
    module procedure index_map_assign_int  
    module procedure index_map_assign_array  
  end interface
```

```
Evaluators: procedures +≡  
  elemental subroutine index_map_assign_int (map, ival)  
    type(index_map_t), intent(inout) :: map  
    integer, intent(in) :: ival  
    map%entry = ival  
  end subroutine index_map_assign_int
```

```

subroutine index_map_assign_array (map, array)
  type(index_map_t), intent(inout) :: map
  integer, dimension(:), intent(in) :: array
  map%entry = array
end subroutine index_map_assign_array

⟨Evaluators: procedures⟩+≡
elemental subroutine index_map_set_entry (map, i, ival)
  type(index_map_t), intent(inout) :: map
  integer, intent(in) :: i
  integer, intent(in) :: ival
  map%entry(i) = ival
end subroutine index_map_set_entry

```

```

⟨Evaluators: procedures⟩+≡
elemental function index_map_get_entry (map, i) result (ival)
  integer :: ival
  type(index_map_t), intent(in) :: map
  integer, intent(in) :: i
  ival = map%entry(i)
end function index_map_get_entry

```

### Index mapping (two-dimensional)

This is a variant with a square matrix instead of an array.

```

⟨Evaluators: types⟩+≡
type :: index_map2_t
  integer :: s = 0
  integer, dimension(:, :), allocatable :: entry
end type index_map2_t

```

```

⟨Evaluators: procedures⟩+≡
elemental subroutine index_map2_init (map, n)
  type(index_map2_t), intent(out) :: map
  integer, intent(in) :: n
  map%s = n
  allocate (map%entry (n, n))
end subroutine index_map2_init

```

```

⟨Evaluators: procedures⟩+≡
function index_map2_exists (map) result (flag)
  logical :: flag
  type(index_map2_t), intent(in) :: map
  flag = allocated (map%entry)
end function index_map2_exists

```

```

⟨Evaluators: interfaces⟩+≡
interface size
  module procedure index_map2_size
end interface

```

```

⟨Evaluators: procedures⟩+≡
    function index_map2_size (map) result (s)
        integer :: s
        type(index_map2_t), intent(in) :: map
        s = map%s
    end function index_map2_size

⟨Evaluators: interfaces⟩+≡
    interface assignment(=)
        module procedure index_map2_assign_int
    end interface

⟨Evaluators: procedures⟩+≡
    elemental subroutine index_map2_assign_int (map, ival)
        type(index_map2_t), intent(inout) :: map
        integer, intent(in) :: ival
        map%entry = ival
    end subroutine index_map2_assign_int

⟨Evaluators: procedures⟩+≡
    elemental subroutine index_map2_set_entry (map, i, j, ival)
        type(index_map2_t), intent(inout) :: map
        integer, intent(in) :: i, j
        integer, intent(in) :: ival
        map%entry(i,j) = ival
    end subroutine index_map2_set_entry

⟨Evaluators: procedures⟩+≡
    elemental function index_map2_get_entry (map, i, j) result (ival)
        integer :: ival
        type(index_map2_t), intent(in) :: map
        integer, intent(in) :: i, j
        ival = map%entry(i,j)
    end function index_map2_get_entry

```

### Auxiliary structures: particle mask

This is a simple container of a logical array.

```

⟨Evaluators: types⟩+≡
    type :: prt_mask_t
        logical, dimension(:), allocatable :: entry
    end type prt_mask_t

```

```

⟨Evaluators: procedures⟩+≡
    subroutine prt_mask_init (mask, n)
        type(prt_mask_t), intent(out) :: mask
        integer, intent(in) :: n
        allocate (mask%entry (n))
    end subroutine prt_mask_init

```

```

⟨Evaluators: interfaces⟩+≡
  interface size
    module procedure prt_mask_size
  end interface

⟨Evaluators: procedures⟩+≡
  function prt_mask_size (mask) result (s)
    integer :: s
    type(prt_mask_t), intent(in) :: mask
    s = size (mask%entry)
  end function prt_mask_size

```

### Quantum number containers

Trivial transparent containers:

```

⟨Evaluators: types⟩+≡
  type :: qn_list_t
    type(quantum_numbers_t), dimension(:, :, :), allocatable :: qn
  end type qn_list_t

  type :: qn_mask_array_t
    type(quantum_numbers_mask_t), dimension(:, :, :), allocatable :: mask
  end type qn_mask_array_t

```

### Auxiliary structures: connection entries

This type is used as intermediate storage when computing the product of two evaluators or the square of an evaluator. The quantum-number array `qn` corresponds to the particles common to both interactions, but irrelevant quantum numbers (color) masked out. The index arrays `index_in` determine the entries in the input interactions that contribute to this connection. `n_index` is the size of these arrays, and `count` is used while filling the entries. Finally, the quantum-number arrays `qn_in_list` are the actual entries in the input interaction that contribute. In the product case, they exclude the connected quantum numbers.

Each evaluator has its own `connection_table` which contains an array of `connection_entry` objects, but also has stuff that specifically applies to the evaluator type. Hence, we do not generalize the `connection_table_t` type.

The filling procedure `connection_entry_add_state` is specific to the various evaluator types.

```

⟨Evaluators: types⟩+≡
  type :: connection_entry_t
    type(quantum_numbers_t), dimension(:, :, :), allocatable :: qn_conn
    integer, dimension(:, :, :), allocatable :: n_index
    integer, dimension(:, :, :), allocatable :: count
    type(index_map_t), dimension(:, :, :), allocatable :: index_in
    type(qn_list_t), dimension(:, :, :), allocatable :: qn_in_list
  end type connection_entry_t

```

*(Evaluators: procedures)* +≡

```

subroutine connection_entry_init &
    (entry, n_count, n_map, qn_conn, count, n_rest)
    type(connection_entry_t), intent(out) :: entry
    integer, intent(in) :: n_count, n_map
    type(quantum_numbers_t), dimension(:, ), intent(in) :: qn_conn
    integer, dimension(n_count), intent(in) :: count
    integer, dimension(n_count), intent(in) :: n_rest
    integer :: i
    allocate (entry%qn_conn (size (qn_conn)))
    allocate (entry%n_index (n_count))
    allocate (entry%count (n_count))
    allocate (entry%index_in (n_map))
    allocate (entry%qn_in_list (n_count))
    entry%qn_conn = qn_conn
    entry%n_index = count
    entry%count = 0
    if (size (entry%index_in) == size (count)) then
        call index_map_init (entry%index_in, count)
    else
        call index_map_init (entry%index_in, count(1))
    end if
    do i = 1, n_count
        allocate (entry%qn_in_list(i)%qn (n_rest(i), count(i)))
    end do
end subroutine connection_entry_init

```

*(Evaluators: procedures)* +≡

```

subroutine connection_entry_write (entry, unit)
    type(connection_entry_t), intent(in) :: entry
    integer, intent(in), optional :: unit
    integer :: i, j
    integer :: u
    u = given_output_unit (unit)
    call quantum_numbers_write (entry%qn_conn, unit)
    write (u, *)
    do i = 1, size (entry%n_index)
        write (u, *) "Input interaction", i
        do j = 1, entry%n_index(i)
            if (size (entry%n_index) == size (entry%index_in)) then
                write (u, "(2x,I0,4x,I0,2x)", advance = "no") &
                    j, index_map_get_entry (entry%index_in(i), j)
            else
                write (u, "(2x,I0,4x,I0,2x,I0,2x)", advance = "no") &
                    j, index_map_get_entry (entry%index_in(1), j), &
                    index_map_get_entry (entry%index_in(2), j)
            end if
            call quantum_numbers_write (entry%qn_in_list(i)%qn(:,j), unit)
            write (u, *)
        end do
    end do
end subroutine connection_entry_write

```

## Color handling

For managing color-factor computation, we introduce this local type. The `index` is the index in the color table that corresponds to a given matrix element index in the input interaction. The `col` array stores the color assignments in rows. The `factor` array associates a complex number with each pair of arrays in the color table. The `factor_is_known` array reveals whether a given factor is known already or still has to be computed.

*(Evaluators: types) +≡*

```
type :: color_table_t
    integer, dimension(:, ), allocatable :: index
    type(color_t), dimension(:, :, ), allocatable :: col
    logical, dimension(:, :, ), allocatable :: factor_is_known
    complex(default), dimension(:, :, ), allocatable :: factor
end type color_table_t
```

This is the initializer. We extract the color states from the given state matrices, establish index mappings between the two states (implemented by the array `me_index`), make an array of color states, and initialize the color-factor table. The latter is two-dimensional (includes interference) and not yet filled.

*(Evaluators: procedures) +≡*

```
subroutine color_table_init (color_table, state, n_tot)
    type(color_table_t), intent(out) :: color_table
    type(state_matrix_t), intent(in) :: state
    integer, intent(in) :: n_tot
    type(state_iterator_t) :: it
    type(quantum_numbers_t), dimension(:, ), allocatable :: qn
    type(state_matrix_t) :: state_col
    integer :: index, n_col_state
    allocate (color_table%index (state%get_n_matrix_elements ()))
    color_table%index = 0
    allocate (qn (n_tot))
    call state_col%init ()
    call it%init (state)
    do while (it%is_valid ())
        index = it%get_me_index ()
        call qn%init (col = it%get_color ())
        call state_col%add_state (qn, me_index = color_table%index(index))
        call it%advance ()
    end do
    n_col_state = state_col%get_n_matrix_elements ()
    allocate (color_table%col (n_tot, n_col_state))
    call it%init (state_col)
    do while (it%is_valid ())
        index = it%get_me_index ()
        color_table%col(:, index) = it%get_color ()
        call it%advance ()
    end do
    call state_col%final ()
    allocate (color_table%factor_is_known (n_col_state, n_col_state))
    allocate (color_table%factor (n_col_state, n_col_state))
    color_table%factor_is_known = .false.
end subroutine color_table_init
```

Output (debugging use):

```
Evaluators: procedures+≡
subroutine color_table_write (color_table, unit)
    type(color_table_t), intent(in) :: color_table
    integer, intent(in), optional :: unit
    integer :: i, j
    integer :: u
    u = given_output_unit (unit)
    write (u, *) "Color table:"
    if (allocated (color_table%index)) then
        write (u, *) " Index mapping state => color table:"
        do i = 1, size (color_table%index)
            write (u, "(3x,I0,2x,I0,2x)") i, color_table%index(i)
        end do
        write (u, *) " Color table:"
        do i = 1, size (color_table%col, 2)
            write (u, "(3x,I0,2x)", advance = "no") i
            call color_write (color_table%col(:,i), unit)
            write (u, *)
        end do
        write (u, *) " Defined color factors:"

                if (color_table%factor_is_known(i,j)) then
                    write (u, *) i, j, color_table%factor(i,j)
                end if
            end do
        end do
    end if
end subroutine color_table_write
```

This subroutine sets color factors, based on information from the hard matrix element: the list of pairs of color-flow indices (in the basis of the matrix element code), the list of corresponding factors, and the list of mappings from the matrix element index in the input interaction to the color-flow index in the hard matrix element object.

We first determine the mapping of color-flow indices from the hard matrix element code to the current color table. The mapping could be nontrivial because the latter is derived from iterating over a state matrix, which may return states in non-canonical order. The translation table can be determined because we have, for the complete state matrix, both the mapping to the hard interaction (the input `col_index_hi`) and the mapping to the current color table (the component `color_table%index`).

Once this mapping is known, we scan the list of index pairs `color_flow_index` and translate them to valid color-table index pairs. For this pair, the color factor is set using the corresponding entry in the list `col_factor`.

```
Evaluators: procedures+≡
subroutine color_table_set_color_factors (color_table, &
    col_flow_index, col_factor, col_index_hi)
    type(color_table_t), intent(inout) :: color_table
    integer, dimension(:, :), intent(in) :: col_flow_index
```

```

complex(default), dimension(:), intent(in) :: col_factor
integer, dimension(:), intent(in) :: col_index_hi
integer, dimension(:), allocatable :: hi_to_ct
integer :: n_cflow
integer :: hi_index, me_index, ct_index, cf_index
integer, dimension(2) :: hi_index_pair, ct_index_pair
n_cflow = size (col_index_hi)
if (size (color_table%index) /= n_cflow) &
    call msg_bug ("Mismatch between hard matrix element and color table")
allocate (hi_to_ct (n_cflow))
do me_index = 1, size (color_table%index)
    ct_index = color_table%index(me_index)
    hi_index = col_index_hi(me_index)
    hi_to_ct(hi_index) = ct_index
end do
do cf_index = 1, size (col_flow_index, 2)
    hi_index_pair = col_flow_index(:,cf_index)
    ct_index_pair = hi_to_ct(hi_index_pair)
    color_table%factor(ct_index_pair(1), ct_index_pair(2)) = &
        col_factor(cf_index)
    color_table%factor_is_known(ct_index_pair(1), ct_index_pair(2)) = .true.
end do
end subroutine color_table_set_color_factors

```

This function returns a color factor, given two indices which point to the matrix elements of the initial state matrix. Internally, we can map them to the corresponding indices in the color table. As a side effect, we store the color factor in the color table for later lookup. (I.e., this function is impure.)

```

    end if
end function color_table_get_color_factor

```

### 11.3.4 Creating an evaluator: Matrix multiplication

The evaluator for matrix multiplication is the most complicated variant.

The initializer takes two input interactions and constructs the result evaluator, which consists of the interaction and the multiplication table for the product (or convolution) of the two. Normally, the input interactions are connected by one or more common particles (e.g., decay, structure function convolution).

In the result interaction, quantum numbers of the connections can be summed over. This is determined by the `qn_mask_conn` argument. The `qn_mask_rest` argument is its analog for the other particles within the result interaction. (E.g., for the trace of the state matrix, all quantum numbers are summed over.) Finally, the `connections_are_resonant` argument tells whether the connecting particles should be marked as resonant in the final event record. This is useful for decays.

The algorithm consists of the following steps:

1. `find_connections`: Find the particles which are connected, i.e., common to both input interactions. Either they are directly linked, or both are linked to a common source.
2. `compute_index_bounds_and_mappings`: Compute the mappings of particle indices from the input interactions to the result interaction. There is a separate mapping for the connected particles.
3. `accumulate_connected_states`: Create an auxiliary state matrix which lists the possible quantum numbers for the connected particles. When building this matrix, count the number of times each assignment is contained in any of the input states and, for each of the input states, record the index of the matrix element within the new state matrix. For the connected particles, reassign color indices such that no color state is present twice in different color-index assignment. Note that helicity assignments of the connected state can be (and will be) off-diagonal, so no spin correlations are lost in decays.

Do this for both input interactions.

4. `allocate_connection_entries`: Allocate a table of connections. Each table row corresponds to one state in the auxiliary matrix, and to multiple states of the input interactions. It collects all states of the unconnected particles in the two input interactions that are associated with the particular state (quantum-number assignment) of the connected particles.
5. `fill_connection_table`: Fill the table of connections by scanning both input interactions. When copying states, reassign color indices for the unconnected particles such that they match between all involved particle sets (interaction 1, interaction 2, and connected particles).
6. `make_product_interaction`: Scan the table of connections we have just built. For each entry, construct all possible pairs of states of the unconnected particles and combine them with the specific connected-particle state. This is a possible quantum-number assignment of the result interaction. Now mask all quantum numbers that should be summed over, and append this to the result state matrix. Record the matrix element index of the result. We now have the result interaction.

7. **make\_pairing\_array**: First allocate the pairing array with the number of entries of the result interaction. Then scan the table of connections again. For each entry, record the indices of the matrix elements which have to be multiplied and summed over in order to compute this particular matrix element. This makes up the multiplication table.
8. **record\_links**: Transfer all source pointers from the input interactions to the result interaction. Do the same for the internal parent-child relations and resonance assignments. For the connected particles, make up appropriate additional parent-child relations. This allows for fetching momenta from other interactions when a new event is filled, and to reconstruct the event history when the event is analyzed.

After all this is done, for each event, we just have to evaluate the pairing arrays (multiplication tables) in order to compute the result matrix elements in their proper positions. The quantum-number assignments remain fixed from now on.

```

        col_flow_index, col_factor, col_index_hi, expand_color_flows, nc)
    end if
  end subroutine evaluator_init_square

```

#### Color-summed squared matrix (diagonal helicities)

The initializer for an evaluator that squares a matrix element, including color factors. The mask must be such that off-diagonal matrix elements are excluded.

If `color_flows` is set, the evaluator keeps color-flow entries separate and drops all interfering color structures. The color factors are set to unity in this case.

There is only one input interaction. The quantum-number mask is an array, one entry for each particle, so they can be treated individually. For academic purposes, we allow for the number of colors being different from three (but 3 is the default).

The algorithm is analogous to multiplication, with a few notable differences:

1. The connected particles are known, the correspondence is one-to-one. All particles are connected, and the mapping of indices is trivial, which simplifies the following steps.
2. `accumulate_connected_states`: The matrix of connected states encompasses all particles, but color indices are removed. However, ghost states are still kept separate from physical color states. No color-index reassignment is necessary.
3. The table of connections contains single index and quantum-number arrays instead of pairs of them. They are paired with themselves in all possible ways.
4. `make_squared_interaction`: Now apply the predefined quantum-numbers mask, which usually collects all color states (physical and ghosts), and possibly a helicity sum.
5. `make_pairing_array`: For each pair of input states, compute the color factor (including a potential ghost-parity sign) and store this in the pairing array together with the matrix-element indices for multiplication.
6. `record_links`: This is again trivial due to the one-to-one correspondence.

### Color-summed squared matrix (support nodiagonal helicities)

The initializer for an evaluator that squares a matrix element, including color factors. Unless requested otherwise by the quantum-number mask, the result contains off-diagonal matrix elements. (The input interaction must be diagonal since it represents an amplitude, not a density matrix.)

There is only one input interaction. The quantum-number mask is an array, one entry for each particle, so they can be treated individually. For academic purposes, we allow for the number of colors being different from three (but 3 is the default).

The algorithm is analogous to the previous one, with some additional complications due to the necessity to loop over two helicity indices.

### Copy with additional contracted color states

This evaluator involves no square or multiplication, its matrix elements are just copies of the (single) input interaction. However, the state matrix of the interaction contains additional states that have color indices contracted. This is used for copies of the beam or structure-function interactions that need to match the hard interaction also in the case where its color indices coincide.

```

    call interaction_get_unstable_particle (eval%interaction_t, flv, p, i)
end subroutine evaluator_get_unstable_particle

```

### 11.3.6 Creating an evaluator: identity

The identity evaluator creates a copy of the first input evaluator; the second input is not used.

All particles link back to the input evaluator and the internal relations are copied. As evaluation does take a shortcut by cloning the matrix elements, the pairing array is not used and does not have to be set up.

```

⟨Evaluators: evaluator: TBP⟩+≡
procedure :: init_identity => evaluator_init_identity

```

```

⟨Evaluators: procedures⟩+≡
  subroutine evaluator_init_identity (eval, int)
    class(evaluator_t), intent(out), target :: eval
    class(interaction_t), intent(in), target :: int
    integer :: n_in, n_out, n_vir, n_tot
    integer :: i
    integer, dimension(:), allocatable :: map
    type(state_matrix_t), pointer :: state
    type(state_iterator_t) :: it

    eval%type = EVAL_IDENTITY
    eval%int_in1 => int
    nullify (eval%int_in2)
    n_in = int%get_n_in ()
    n_out = int%get_n_out ()
    n_vir = int%get_n_vir ()
    n_tot = int%get_n_tot ()
    call eval%interaction_t%basic_init (n_in, n_vir, n_out, &
      mask=int%get_mask (), &
      resonant=int%get_resonance_flags ())
    do i = 1, n_tot
      call eval%set_source_link (i, int, i)
    end do
    allocate (map(n_tot))
    map = [(i, i = 1, n_tot)]
    call int%transfer_relations (eval, map)
    state => int%get_state_matrix_ptr ()
    call it%init (state)
    do while (it%is_valid ())
      call eval%add_state (it%get_quantum_numbers (), &
        it%get_me_index ())
      call it%advance ()
    end do
    call eval%freeze ()

  end subroutine evaluator_init_identity

```

### 11.3.7 Creating an evaluator: quantum number sum

This evaluator operates on the diagonal of a density matrix and sums over the quantum numbers specified by the mask. The optional argument `drop` allows to drop a particle from the resulting density matrix. The handling of virtuals is not completely sane, especially in connection with dropping particles.

When summing over matrix element entries, we keep the separation into entries and normalization (in the corresponding evaluation routine below).

```

⟨Evaluators: evaluator: TBP⟩+≡
  procedure :: init_qn_sum => evaluator_init_qn_sum

⟨Evaluators: procedures⟩+≡
  subroutine evaluator_init_qn_sum (eval, int, qn_mask, drop)
    class(evaluator_t), intent(out), target :: eval
    class(interaction_t), target, intent(in) :: int

```

```

    end if
end do

end subroutine evaluator_init_qn_sum

```

### 11.3.8 Evaluation

When the input interactions (which are pointed to in the pairings stored within the evaluator) are filled with values, we can activate the evaluator, i.e., calculate the result values which are stored in the interaction.

The evaluation of matrix elements can be done in parallel. A `forall` construct is not appropriate, however. We would need `do concurrent` here. Nevertheless, the evaluation functions are marked as `pure`.

```

⟨Evaluators: evaluator: TBP⟩+≡
procedure :: evaluate => evaluator_evaluate

⟨Evaluators: procedures⟩+≡
subroutine evaluator_evaluate (eval)
    class(evaluator_t), intent(inout), target :: eval

use model_data

use evaluators

⟨Standard module head⟩

⟨Evaluators: test declarations⟩

contains

```

```

⟨Evaluators: tests⟩

end module evaluators_ut
API: driver for the unit tests below.
⟨Evaluators: public test⟩≡
public :: evaluator_test
⟨Evaluators: test driver⟩≡
subroutine evaluator_test (u, results)
integer, intent(in) :: u
type(test_results_t), intent(inout) :: results
⟨Evaluators: execute tests⟩
end subroutine evaluator_test

Test: Create two interactions. The interactions are twofold connected. The first connection has a helicity index that is kept, the second connection has a helicity index that is summed over. Concatenate the interactions in an evaluator, which thus contains a result interaction. Fill the input interactions with values, activate the evaluator and print the result.

# Chapter 12

# Sindarin Built-In Types

Here, we define a couple of types and objects which are useful both internally for **WHIZARD**, and visible to the user, so they correspond to Sindarin types.

**particle\_specifiers** Expressions for particles and particle alternatives, involving particle names.

**pdg\_arrays** Integer (PDG) codes for particles. Useful for particle aliases (e.g., 'quark' for  $u, d, s$  etc.).

**jets** Define (pseudo)jets as objects. Functional only if the **fastjet** library is linked. (This may change in the future.)

**subevents** Particle collections built from event records, for use in analysis and other Sindarin expressions

**analysis** Observables, histograms, and plots.

## 12.1 Particle Specifiers

In this module we introduce a type for specifying a particle or particle alternative. In addition to the particle specifiers (strings separated by colons), the type contains an optional flag **polarized** and a string **decay**. If the **polarized** flag is set, particle polarization information should be kept when generating events for this process. If the **decay** string is set, it is the ID of a decay process which should be applied to this particle when generating events.

In input/output form, the **polarized** flag is indicated by an asterisk (\*) in brackets, and the **decay** is indicated by its ID in brackets.

The **read** and **write** procedures in this module are not type-bound but generic procedures which handle scalar and array arguments.

```
<particle_specifiers.f90>≡  
<File header>  
  
module particle_specifiers  
  
<Use strings>  
  use io_units  
  use diagnostics
```

```

⟨Standard module head⟩

⟨Particle specifiers: public⟩

⟨Particle specifiers: types⟩

⟨Particle specifiers: interfaces⟩

contains

⟨Particle specifiers: procedures⟩

end module particle_specifiers

```

### 12.1.1 Base type

This is an abstract type which can hold a single particle or an expression.

```

⟨Particle specifiers: types⟩≡
  type, abstract :: prt_spec_expr_t
  contains
    ⟨Particle specifiers: prt spec expr: TBP⟩
  end type prt_spec_expr_t

```

Output, as a string.

```

⟨Particle specifiers: prt spec expr: TBP⟩≡
  procedure (prt_spec_expr_to_string), deferred :: to_string
⟨Particle specifiers: interfaces⟩≡
  abstract interface
    function prt_spec_expr_to_string (object) result (string)
      import
      class(prt_spec_expr_t), intent(in) :: object
      type(string_t) :: string
    end function prt_spec_expr_to_string
  end interface

```

Call an `expand` method for all enclosed subexpressions (before handling the current expression).

```

⟨Particle specifiers: prt spec expr: TBP⟩+≡
  procedure (prt_spec_expr_expand_sub), deferred :: expand_sub
⟨Particle specifiers: interfaces⟩+≡
  abstract interface
    subroutine prt_spec_expr_expand_sub (object)
      import
      class(prt_spec_expr_t), intent(inout) :: object
    end subroutine prt_spec_expr_expand_sub
  end interface

```

### 12.1.2 Wrapper type

This wrapper can hold a particle expression of any kind. We need it so we can make variadic arrays.

```
<Particle specifiers: public>≡
    public :: prt_expr_t

<Particle specifiers: types>+≡
    type :: prt_expr_t
        class(prt_spec_expr_t), allocatable :: x
        contains
            <Particle specifiers: prt expr: TBP>
    end type prt_expr_t
```

Output as a string: delegate.

```
<Particle specifiers: prt expr: TBP>≡
    procedure :: to_string => prt_expr_to_string

<Particle specifiers: procedures>≡
    recursive function prt_expr_to_string (object) result (string)
        class(prt_expr_t), intent(in) :: object
        type(string_t) :: string
        if (allocated (object%x)) then
            string = object%x%to_string ()
        else
            string = ""
        end if
    end function prt_expr_to_string
```

Allocate the expression as a particle specifier and copy the value.

```
<Particle specifiers: prt expr: TBP>+≡
    procedure :: init_spec => prt_expr_init_spec

<Particle specifiers: procedures>+≡
    subroutine prt_expr_init_spec (object, spec)
        class(prt_expr_t), intent(out) :: object
        type(prt_spec_t), intent(in) :: spec
        allocate (prt_spec_t :: object%x)
        select type (x => object%x)
        type is (prt_spec_t)
            x = spec
        end select
    end subroutine prt_expr_init_spec
```

Allocate as a list/sum and allocate for a given length

```
<Particle specifiers: prt expr: TBP>+≡
    procedure :: init_list => prt_expr_init_list
    procedure :: init_sum => prt_expr_init_sum

<Particle specifiers: procedures>+≡
    subroutine prt_expr_init_list (object, n)
        class(prt_expr_t), intent(out) :: object
        integer, intent(in) :: n
        allocate (prt_spec_list_t :: object%x)
```

```

select type (x => object%x)
type is (prt_spec_list_t)
    allocate (x%expr (n))
end select
end subroutine prt_expr_init_list

subroutine prt_expr_init_sum (object, n)
    class(prt_expr_t), intent(out) :: object
    integer, intent(in) :: n
    allocate (prt_spec_sum_t :: object%x)
    select type (x => object%x)
    type is (prt_spec_sum_t)
        allocate (x%expr (n))
    end select
end subroutine prt_expr_init_sum

```

Return the number of terms. This is unity, except if the expression is a sum.

```

⟨Particle specifiers: prt expr: TBP⟩+≡
procedure :: get_n_terms => prt_expr_get_n_terms

⟨Particle specifiers: procedures⟩+≡
function prt_expr_get_n_terms (object) result (n)
    class(prt_expr_t), intent(in) :: object
    integer :: n
    if (allocated (object%x)) then
        select type (x => object%x)
        type is (prt_spec_sum_t)
            n = size (x%expr)
        class default
            n = 1
        end select
    else
        n = 0
    end if
end function prt_expr_get_n_terms

```

Transform one of the terms, as returned by the previous method, to an array of particle specifiers. The array has more than one entry if the selected term is a list. This makes sense only if the expression has been completely expanded, so the list contains only atoms.

```

⟨Particle specifiers: prt expr: TBP⟩+≡
procedure :: term_to_array => prt_expr_term_to_array

⟨Particle specifiers: procedures⟩+≡
recursive subroutine prt_expr_term_to_array (object, array, i)
    class(prt_expr_t), intent(in) :: object
    type(prt_spec_t), dimension(:), intent(inout), allocatable :: array
    integer, intent(in) :: i
    integer :: j
    if (allocated (array)) deallocate (array)
    select type (x => object%x)
    type is (prt_spec_t)
        allocate (array (1))
        array(1) = x

```

```

type is (prt_spec_list_t)
    allocate (array (size (x%expr)))
    do j = 1, size (array)
        select type (y => x%expr(j)%x)
        type is (prt_spec_t)
            array(j) = y
        end select
    end do
    type is (prt_spec_sum_t)
        call x%expr(i)%term_to_array (array, 1)
    end select
end subroutine prt_expr_term_to_array

```

### 12.1.3 The atomic type

The trivial case is a single particle, including optional decay and polarization attributes.

#### Definition

The particle is unstable if the `decay` array is allocated. The `polarized` flag and `decays` may not be set simultaneously.

```

⟨Particle specifiers: public⟩+≡
    public :: prt_spec_t

⟨Particle specifiers: types⟩+≡
    type, extends (prt_spec_expr_t) :: prt_spec_t
        private
        type(string_t) :: name
        logical :: polarized = .false.
        type(string_t), dimension(:), allocatable :: decay
        contains
            ⟨Particle specifiers: prt spec: TBP⟩
    end type prt_spec_t

```

#### I/O

Output. Old-style subroutines.

```

⟨Particle specifiers: public⟩+≡
    public :: prt_spec_write

⟨Particle specifiers: interfaces⟩+≡
    interface prt_spec_write
        module procedure prt_spec_write1
        module procedure prt_spec_write2
    end interface prt_spec_write

⟨Particle specifiers: procedures⟩+≡
    subroutine prt_spec_write1 (object, unit, advance)
        type(prt_spec_t), intent(in) :: object
        integer, intent(in), optional :: unit
        character(len=*), intent(in), optional :: advance

```

```

character(3) :: adv
integer :: u
u = given_output_unit (unit)
adv = "yes"; if (present (advance)) adv = advance
write (u, "(A)", advance = adv) char (object%to_string ())
end subroutine prt_spec_write1

```

Write an array as a list of particle specifiers.

*(Particle specifiers: procedures)*+≡

```

```

## Access Methods

Return the particle name without qualifiers

```

⟨Particle specifiers: prt spec: TBP⟩≡
procedure :: get_name => prt_spec_get_name

⟨Particle specifiers: procedures⟩+≡
elemental function prt_spec_get_name (prt_spec) result (name)
    class(prt_spec_t), intent(in) :: prt_spec
    type(string_t) :: name
    name = prt_spec%name
end function prt_spec_get_name

```

Return the name with qualifiers

```

⟨Particle specifiers: prt spec: TBP⟩+≡
procedure :: to_string => prt_spec_to_string

⟨Particle specifiers: procedures⟩+≡
function prt_spec_to_string (object) result (string)
    class(prt_spec_t), intent(in) :: object
    type(string_t) :: string
    integer :: i
    string = object%name

```

```

if (allocated (object%decay)) then
    string = string // "("
    do i = 1, size (object%decay)
        if (i > 1) string = string // " + "
        string = string // object%decay(i)
    end do
    string = string // ")"
else if (object%polarized) then
    string = string // "(*"
end if
end function prt_spec_to_string

```

Return the polarization flag

```

⟨Particle specifiers: prt spec: TBP⟩+≡
procedure :: is_polarized => prt_spec_is_polarized

⟨Particle specifiers: procedures⟩+≡
elemental function prt_spec_is_polarized (prt_spec) result (flag)
    class(prt_spec_t), intent(in) :: prt_spec
    logical :: flag
    flag = prt_spec%polarized
end function prt_spec_is_polarized

```

The particle is unstable if there is a decay array.

```

⟨Particle specifiers: prt spec: TBP⟩+≡
procedure :: is_unstable => prt_spec_is_unstable

⟨Particle specifiers: procedures⟩+≡
elemental function prt_spec_is_unstable (prt_spec) result (flag)
    class(prt_spec_t), intent(in) :: prt_spec
    logical :: flag
    flag = allocated (prt_spec%decay)
end function prt_spec_is_unstable

```

Return the number of decay channels

```

⟨Particle specifiers: prt spec: TBP⟩+≡
procedure :: get_n_decays => prt_spec_get_n_decays

⟨Particle specifiers: procedures⟩+≡
elemental function prt_spec_get_n_decays (prt_spec) result (n)
    class(prt_spec_t), intent(in) :: prt_spec
    integer :: n
    if (allocated (prt_spec%decay)) then
        n = size (prt_spec%decay)
    else
        n = 0
    end if
end function prt_spec_get_n_decays

```

Return the decay channels

```

⟨Particle specifiers: prt spec: TBP⟩+≡
procedure :: get_decays => prt_spec_get_decays

```

```

⟨Particle specifiers: procedures⟩+≡
    subroutine prt_spec_get_decays (prt_spec, decay)
        class(prt_spec_t), intent(in) :: prt_spec
        type(string_t), dimension(:,), allocatable, intent(out) :: decay
        if (allocated (prt_spec%decay)) then
            allocate (decay (size (prt_spec%decay)))
            decay = prt_spec%decay
        else
            allocate (decay (0))
        end if
    end subroutine prt_spec_get_decays

```

### Miscellaneous

There is nothing to expand here:

```

⟨Particle specifiers: prt spec: TBP⟩+≡
    procedure :: expand_sub => prt_spec_expand_sub
⟨Particle specifiers: procedures⟩+≡
    subroutine prt_spec_expand_sub (object)
        class(prt_spec_t), intent(inout) :: object
    end subroutine prt_spec_expand_sub

```

#### 12.1.4 List

A list of particle specifiers, indicating, e.g., the final state of a process.

```

⟨Particle specifiers: public⟩+≡
    public :: prt_spec_list_t
⟨Particle specifiers: types⟩+≡
    type, extends (prt_spec_expr_t) :: prt_spec_list_t
        type(prt_expr_t), dimension(:,), allocatable :: expr
        contains
            ⟨Particle specifiers: prt spec list: TBP⟩
    end type prt_spec_list_t

```

### 12.1.5 Sum

A sum of particle specifiers, indicating, e.g., a sum of final states.

*(Particle specifiers: public)*+≡  
 public :: prt\_spec\_sum\_t  
*(Particle specifiers: types)*+≡  
 type, extends (prt\_spec\_expr\_t) :: prt\_spec\_sum\_t  
 type(prt\_expr\_t), dimension(:), allocatable :: expr  
 contains  
*(Particle specifiers: prt spec sum: TBP)*  
 end type prt\_spec\_sum\_t

Output: Concatenate the components. Insert brackets if the component is a list or also a sum. The components of the `expr` array, if any, should all be filled.

*(Particle specifiers: prt spec sum: TBP)*≡  
 procedure :: to\_string => prt\_spec\_sum\_to\_string  
*(Particle specifiers: procedures)*+≡  
 recursive function prt\_spec\_sum\_to\_string (object) result (string)  
 class(prt\_spec\_sum\_t), intent(in) :: object  
 type(string\_t) :: string  
 integer :: i  
 string = ""  
 if (allocated (object%expr)) then
 do i = 1, size (object%expr)
 if (i > 1) string = string // " + "
 select type (x => object%expr(i)%x)
 type is (prt\_spec\_list\_t)
 string = string // "(" // x%to\_string () // ")"
 type is (prt\_spec\_sum\_t)
 string = string // "(" // x%to\_string () // ")"
 class default
 string = string // x%to\_string ()
 end select
 end do
 end if
end function prt\_spec\_sum\_to\_string

Flatten: if there is a subexpression which is also a sum, include the components as direct members of the current sum.

This is identical to `prt_spec_list_flatten` above, except for the type.

*(Particle specifiers: prt spec sum: TBP)*+≡  
 procedure :: flatten => prt\_spec\_sum\_flatten

```

⟨Particle specifiers: procedures⟩+≡

                end select
            end do
            if (n_flat > size (object%expr)) then
                allocate (tmp_expr (n_flat))
                i_flat = 0
                do i = 1, size (object%expr)
                    select type (y => object%expr(i)%x)
                    type is (prt_spec_sum_t)
                        tmp_expr (i_flat + 1 : i_flat + size (y%expr)) = y%expr
                        i_flat = i_flat + size (y%expr)
                    class default
                        tmp_expr (i_flat + 1) = object%expr(i)
                        i_flat = i_flat + 1
                    end select
                end do
            end if
            if (allocated (tmp_expr)) &
                call move_alloc (from = tmp_expr, to = object%expr)
        end subroutine prt_spec_sum_flatten

```

Apply `expand` to all terms in the sum.

```

⟨Particle specifiers: prt spec sum: TBP⟩+≡
    procedure :: expand_sub => prt_spec_sum_expand_sub

⟨Particle specifiers: procedures⟩+≡
    recursive subroutine prt_spec_sum_expand_sub (object)
        class(prt_spec_sum_t), intent(inout) :: object
        integer :: i
        if (allocated (object%expr)) then
            do i = 1, size (object%expr)
                call object%expr(i)%expand ()
            end do
        end if
    end subroutine prt_spec_sum_expand_sub

```

### 12.1.6 Expression Expansion

The `expand` method transforms each particle specifier expression into a sum of lists, according to the rules

$$a, (b, c) \rightarrow a, b, c \quad (12.1)$$

$$a + (b + c) \rightarrow a + b + c \quad (12.2)$$

$$a, b + c \rightarrow (a, b) + (a, c) \quad (12.3)$$

Note that the precedence of comma and plus are opposite to this expansion, so the parentheses in the final expression are necessary.

We assume that subexpressions are filled, i.e., arrays are allocated.

```
(Particle specifiers: prt expr: TBP)+≡
procedure :: expand => prt_expr_expand

(Particle specifiers: procedures)+≡
recursive subroutine prt_expr_expand (expr)
  class(prt_expr_t), intent(inout) :: expr
  if (allocated (expr%x)) then
    call distribute_prt_spec_list (expr%x)
    call expr%x%expand_sub ()
    select type (x => expr%x)
    type is (prt_spec_list_t)
      call x%flatten ()
    type is (prt_spec_sum_t)
      call x%flatten ()
    end select
  end if
end subroutine prt_expr_expand
```

### 12.1.7 Unit Tests

Test module, followed by the corresponding implementation module.

write (u, "(A)"  "* Test output end: particle_specifiers_2"
end subroutine particle_specifiers_2

```

## 12.2 PDG arrays

For defining aliases, we introduce a special type which holds a set of (integer) PDG codes.

*(pdg\_arrays.f90)≡  
(File header)*

```

module pdg_arrays

use io_units
use sorting
use physics_defs, only: UNDEFINED

(Standard module head)

(PDG arrays: public)

(PDG arrays: types)

(PDG arrays: interfaces)

contains

```

```
(PDG arrays: procedures)
```

```
end module pdg_arrays
```

### 12.2.1 Type definition

Using an allocatable array eliminates the need for initializer and/or finalizer.

```
(PDG arrays: public)≡
  public :: pdg_array_t
(PDG arrays: types)≡
  type :: pdg_array_t
    private
    integer, dimension(:), allocatable :: pdg
  contains
    (PDG arrays: pdg array: TBP)
  end type pdg_array_t
```

Output

```
(PDG arrays: public)+≡
  public :: pdg_array_write
(PDG arrays: pdg array: TBP)≡
  procedure :: write => pdg_array_write
(PDG arrays: procedures)≡
  subroutine pdg_array_write (aval, unit)
    class(pdg_array_t), intent(in) :: aval
    integer, intent(in), optional :: unit
    integer :: u, i
    u = given_output_unit (unit);  if (u < 0)  return
    write (u, "(A)", advance="no")  "PDG("
    if (allocated (aval%pdg)) then
      do i = 1, size (aval%pdg)
        if (i > 1)  write (u, "(A)", advance="no")  ","
        write (u, "(IO)", advance="no")  aval%pdg(i)
      end do
    end if
    write (u, "(A)", advance="no")  ")"
  end subroutine pdg_array_write
```

### 12.2.2 Basic operations

Assignment. We define assignment from and to an integer array. Note that the integer array, if it is the l.h.s., must be declared allocatable by the caller.

```
(PDG arrays: public)+≡
  public :: assignment(=)
(PDG arrays: interfaces)≡
  interface assignment(=)
    module procedure pdg_array_from_int_array
    module procedure pdg_array_from_int
    module procedure int_array_from_pdg_array
```

```

end interface

⟨PDG arrays: procedures⟩+≡
subroutine pdg_array_from_int_array (aval, iarray)
    type(pdg_array_t), intent(out) :: aval
    integer, dimension(:), intent(in) :: iarray
    allocate (aval%pdg (size (iarray)))
    aval%pdg = iarray
end subroutine pdg_array_from_int_array

elemental subroutine pdg_array_from_int (aval, int)
    type(pdg_array_t), intent(out) :: aval
    integer, intent(in) :: int
    allocate (aval%pdg (1))
    aval%pdg = int
end subroutine pdg_array_from_int

subroutine int_array_from_pdg_array (iarray, aval)
    integer, dimension(:), allocatable, intent(out) :: iarray
    type(pdg_array_t), intent(in) :: aval
    if (allocated (aval%pdg)) then
        allocate (iarray (size (aval%pdg)))
        iarray = aval%pdg
    else
        allocate (iarray (0))
    end if
end subroutine int_array_from_pdg_array

```

Allocate space for a PDG array

```

⟨PDG arrays: public⟩+≡

    aval = aval2
end if
end function concat_pdg_arrays

```

### 12.2.3 Matching

A PDG array matches a given PDG code if the code is present within the array. If either one is zero (UNDEFINED), the match also succeeds.

```

⟨PDG arrays: public⟩+≡
public :: operator(.match.)
⟨PDG arrays: interfaces⟩+≡
interface operator(.match.)
    module procedure pdg_array_match_integer
    module procedure pdg_array_match_pdg_array
end interface

```

Match a single code against the array.

```

⟨PDG arrays: procedures⟩+≡
elemental function pdg_array_match_integer (aval, pdg) result (flag)
    logical :: flag
    type(pdg_array_t), intent(in) :: aval
    integer, intent(in) :: pdg
    if (allocated (aval%pdg)) then
        flag = pdg == UNDEFINED &
               .or. any (aval%pdg == UNDEFINED) &
               .or. any (aval%pdg == pdg)
    else
        flag = .false.
    end if
end function pdg_array_match_integer

```

Check if the pdg-number corresponds to a quark

```

⟨PDG arrays: public⟩+≡
public :: is_quark
⟨PDG arrays: procedures⟩+≡
function is_quark (pdg_nr) result(res)
    integer, intent(in) :: pdg_nr
    logical :: res

    end select
  end do
end function pdg_array_invert

```

### 12.2.5 PDG array list

A PDG array list, or PDG list, is an array of PDG-array objects with some convenience methods.

```

⟨PDG arrays: public⟩+≡
public :: pdg_list_t

```

```

⟨PDG arrays: types⟩+≡
  type :: pdg_list_t
    type(pdg_array_t), dimension(:), allocatable :: a
    contains
      ⟨PDG arrays: pdg list: TBP⟩
  end type pdg_list_t

```

Output, as a comma-separated list without advancing I/O.

```

⟨PDG arrays: pdg list: TBP⟩≡
  procedure :: write => pdg_list_write
⟨PDG arrays: procedures⟩+≡
  subroutine pdg_list_write (object, unit)
    class(pdg_list_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u, i
    u = given_output_unit (unit)
    if (allocated (object%a)) then
      do i = 1, size (object%a)
        if (i > 1)  write (u, "(A)", advance="no")  ", "
        call object%a(i)%write (u)
      end do
    end if
  end subroutine pdg_list_write

```

Initialize for a certain size. The entries are initially empty PDG arrays.

```

⟨PDG arrays: pdg list: TBP⟩+≡
  generic :: init => pdg_list_init_size
  procedure, private :: pdg_list_init_size
⟨PDG arrays: procedures⟩+≡
  subroutine pdg_list_init_size (pl, n)
    class(pdg_list_t), intent(out) :: pl
    integer, intent(in) :: n
    allocate (pl%a (n))
  end subroutine pdg_list_init_size

```

Initialize with a definite array of PDG codes. That is, each entry in the list becomes a single-particle PDG array.

```

⟨PDG arrays: pdg list: TBP⟩+≡
  generic :: init => pdg_list_init_int_array
  procedure, private :: pdg_list_init_int_array
⟨PDG arrays: procedures⟩+≡
  subroutine pdg_list_init_int_array (pl, pdg)
    class(pdg_list_t), intent(out) :: pl
    integer, dimension(:), intent(in) :: pdg
    integer :: i
    allocate (pl%a (size (pdg)))
    do i = 1, size (pdg)
      pl%a(i) = pdg(i)
    end do
  end subroutine pdg_list_init_int_array

```

Set one of the entries. No bounds-check.

```

```

Compare sorted lists. The result is undefined if some entries are not allocated.

The ordering is quite complicated. First, a shorter list comes before a longer list. Comparing entry by entry, a shorter entry comes first. Next, we check the first PDG code within corresponding entries. This is compared by absolute value. If equal, particle comes before antiparticle. Finally, if all is equal, the result is false.

```

## 12.3 Jets

The FastJet library is linked externally, if available. The wrapper code is also in a separate directory. Here, we define WHIZARD-specific procedures and tests.

```
<jets.f90>≡  
  <File header>  
  
  module jets  
  
    use fastjet !NODEP!  
  
    <Standard module head>  
  
    <Jets: public>  
  
    contains  
  
    <Jets: procedures>  
  
  end module jets
```

### 12.3.1 Re-exported symbols

We use this module as a proxy for the FastJet interface, therefore we re-export some symbols.

```
<Jets: public>≡  
  public :: fastjet_available  
  public :: fastjet_init  
  public :: jet_definition_t  
  public :: pseudojet_t  
  public :: pseudojet_vector_t  
  public :: cluster_sequence_t  
  public :: assignment (=)
```

The initialization routine prints the banner.

```
<Jets: procedures>≡  
  subroutine fastjet_init ()  
    call print_banner ()  
  end subroutine fastjet_init
```

The jet algorithm codes (actually, integers)

```
<Jets: public>+≡  
  public :: kt_algorithm  
  public :: cambridge_algorithm  
  public :: antikt_algorithm  
  public :: genkt_algorithm  
  public :: cambridge_for_passive_algorithm  
  public :: genkt_for_passive_algorithm  
  public :: ee_kt_algorithm  
  public :: ee_genkt_algorithm  
  public :: plugin_algorithm  
  public :: undefined_jet_algorithm
```

### 12.3.2 Unit tests

Test module, followed by the corresponding implementation module.

```
⟨jets_ut.f90⟩≡
  ⟨File header⟩

  module jets_ut
    use unit_tests
    use jets_uti

  ⟨Standard module head⟩

  ⟨Jets: public test⟩

  contains

  ⟨Jets: test driver⟩

  end module jets_ut

⟨jets_uti.f90⟩≡
  ⟨File header⟩

  module jets_uti

  ⟨Use kinds⟩
    use fastjet !NODEP!

  use jets

  ⟨Standard module head⟩

  ⟨Jets: test declarations⟩

  contains

  ⟨Jets: tests⟩

  end module jets_uti

API: driver for the unit tests below.

⟨Jets: public test⟩≡
  public :: jets_test

⟨Jets: test driver⟩≡
  subroutine jets_test (u, results)
    integer, intent(in) :: u
    type (test_results_t), intent(inout) :: results
  ⟨Jets: execute tests⟩
  end subroutine jets_test
```

This test is actually the minimal example from the FastJet manual, translated to Fortran.

Note that FastJet creates pseudojet vectors, which we mirror in the `pseudojet_vector_t`, but immediately assign to pseudojet arrays. Without automatic finalization available in the compilers, we should avoid this in actual code and rather introduce intermediate variables for those objects, which we can finalize explicitly.

```

<Jets: execute tests>≡
    call test (jets_1, "jets_1", &
               "basic FastJet functionality", &
               u, results)

<Jets: test declarations>≡

call cs%final ()

write (u, "(A)")
write (u, "(A)")    "* Test output end: jets_1"

end subroutine jets_1

```

## 12.4 Subevents

The purpose of subevents is to store the relevant part of the physical event (either partonic or hadronic), and to hold particle selections and combinations which are constructed in cut or analysis expressions.

```
(subevents.f90)≡
  ⟨File header⟩

  module subevents

    use, intrinsic :: iso_c_binding !NODEP!

    ⟨Use kinds⟩
    use io_units
    use format_defs, only: FMT_14, FMT_19
    use format_utils, only: pac_fmt
    use sorting
    use c_particles
    use lorentz
    use pdg_arrays
    use jets

    ⟨Standard module head⟩

    ⟨Subevents: public⟩

    ⟨Subevents: parameters⟩

    ⟨Subevents: types⟩

    ⟨Subevents: interfaces⟩

    contains

    ⟨Subevents: procedures⟩

  end module subevents
```

### 12.4.1 Particles

For the purpose of this module, a particle has a type which can indicate a beam, incoming, outgoing, or composite particle, flavor and helicity codes (integer, undefined for composite), four-momentum and invariant mass squared. (Other particles types are used in extended event types, but also defined here.) Furthermore, each particle has an allocatable array of ancestors – particle indices which indicate the building blocks of a composite particle. For an incoming/outgoing particle, the array contains only the index of the particle itself.

For incoming particles, the momentum is inverted before storing it in the particle object.

```
(Subevents: parameters)≡
  integer, parameter, public :: PRT_UNDEFINED = 0
  integer, parameter, public :: PRT_BEAM = -9
```

```

integer, parameter, public :: PRT_INCOMING = 1
integer, parameter, public :: PRT_OUTGOING = 2
integer, parameter, public :: PRT_COMPOSITE = 3
integer, parameter, public :: PRT_VIRTUAL = 4
integer, parameter, public :: PRT_RESONANT = 5
integer, parameter, public :: PRT_BEAM_REMNANT = 9

```

### The type

We initialize only the type here and mark as unpolarized. The initializers below do the rest.

```

⟨Subevents: public⟩≡
  public :: prt_t

⟨Subevents: types⟩≡
  type :: prt_t
    private
    integer :: type = PRT_UNDEFINED
    integer :: pdg
    logical :: polarized = .false.
    integer :: h
    type(vector4_t) :: p
    real(default) :: p2
    integer, dimension(:), allocatable :: src
  end type prt_t

```

Initializers. Polarization is set separately. Finalizers are not needed.

```

⟨Subevents: procedures⟩≡
  subroutine prt_init_beam (prt, pdg, p, p2, src)
    type(prt_t), intent(out) :: prt
    integer, intent(in) :: pdg
    type(vector4_t), intent(in) :: p
    real(default), intent(in) :: p2
    integer, dimension(:), intent(in) :: src
    prt%type = PRT_BEAM
    call prt_set (prt, pdg, - p, p2, src)
  end subroutine prt_init_beam

  subroutine prt_init_incoming (prt, pdg, p, p2, src)
    type(prt_t), intent(out) :: prt
    integer, intent(in) :: pdg
    type(vector4_t), intent(in) :: p
    real(default), intent(in) :: p2
    integer, dimension(:), intent(in) :: src
    prt%type = PRT_INCOMING
    call prt_set (prt, pdg, - p, p2, src)
  end subroutine prt_init_incoming

  subroutine prt_init_outgoing (prt, pdg, p, p2, src)
    type(prt_t), intent(out) :: prt
    integer, intent(in) :: pdg
    type(vector4_t), intent(in) :: p
  end subroutine

```

```

real(default), intent(in) :: p2
integer, dimension(:), intent(in) :: src
prt%type = PRT_OUTGOING
call prt_set (prt, pdg, p, p2, src)
end subroutine prt_init_outgoing

subroutine prt_init_composite (prt, p, src)
  type(prt_t), intent(out) :: prt
  type(vector4_t), intent(in) :: p
  integer, dimension(:), intent(in) :: src
  prt%type = PRT_COMPOSITE
  call prt_set (prt, 0, p, p**2, src)
end subroutine prt_init_composite

```

This version is for temporary particle objects, so the `src` array is not set.

```

<Subevents: public>+≡
  public :: prt_init_combine

<Subevents: procedures>+≡
  subroutine prt_init_combine (prt, prt1, prt2)

## Setting data

Set the PDG, momentum and momentum squared, and ancestors. If allocate-on-assignment is available, this can be simplified.

```

⟨Subevents: procedures⟩+≡
    subroutine prt_set (prt, pdg, p, p2, src)
        type(prt_t), intent(inout) :: prt
        integer, intent(in) :: pdg
        type(vector4_t), intent(in) :: p
        real(default), intent(in) :: p2
        integer, dimension(:), intent(in) :: src
        prt%pdg = pdg

```

```

prt%p = p
prt%p2 = p2
if (allocated (prt%src)) then
    if (size (src) /= size (prt%src)) then
        deallocate (prt%src)
        allocate (prt%src (size (src)))
    end if
else
    allocate (prt%src (size (src)))
end if
prt%src = src
end subroutine prt_set

```

Set the particle PDG code separately.

*(Subevents: procedures)*+≡

```

elemental subroutine prt_set_pdg (prt, pdg)
    type(prt_t), intent(inout) :: prt

    do i = 1, size (prt%src)
        write (u, "(ix,I0)", advance="no")  prt%src(i)
    end do
end if
write (u, "(A)"  ")"
end subroutine prt_write

```

## Tools

Two particles match if their `src` arrays are the same.

```

⟨Subevents: interfaces⟩+≡
interface operator(.match.)
    module procedure prt_match
end interface

⟨Subevents: procedures⟩+≡
elemental function prt_match (prt1, prt2) result (match)
    logical :: match
    type(prt_t), intent(in) :: prt1, prt2
    if (size (prt1%src) == size (prt2%src)) then
        match = all (prt1%src == prt2%src)
    else
        match = .false.
    end if
end function prt_match

```

The combine operation makes a pseudoparticle whose momentum is the result of adding (the momenta of) the pair of input particles. We trace the particles from which a particle is built by storing a `src` array. Each particle entry in the `src` list contains a list of indices which indicates its building blocks. The indices refer to an original list of particles. Index lists are sorted, and they contain no element more than once.

We thus require that in a given pseudoparticle, each original particle occurs at most once.

The result is `intent(inout)`, so it will not be initialized when the subroutine is entered.

```

⟨Subevents: procedures⟩+≡
subroutine prt_combine (prt, prt_in1, prt_in2, ok)
    type(prt_t), intent(inout) :: prt
    type(prt_t), intent(in) :: prt_in1, prt_in2

```

```

logical :: ok
integer, dimension(:), allocatable :: src
call combine_index_lists (src, prt_in1%src, prt_in2%src)
ok = allocated (src)
if (ok) call prt_init_composite (prt, prt_in1%p + prt_in2%p, src)
end subroutine prt_combine

```

This variant does not produce the combined particle, it just checks whether the combination is valid (no common `src` entry).

```

⟨Subevents: public⟩+≡
public :: are_disjoint
⟨Subevents: procedures⟩+≡
function are_disjoint (prt_in1, prt_in2) result (flag)
logical :: flag
type(prt_t), intent(in) :: prt_in1, prt_in2
flag = index_lists_are_disjoint (prt_in1%src, prt_in2%src)
end function are_disjoint

```

`src` Lists with length > 1 are built by a `combine` operation which merges the lists in a sorted manner. If the result would have a duplicate entry, it is discarded, and the result is unallocated.

```

⟨Subevents: procedures⟩+≡
subroutine combine_index_lists (res, src1, src2)
integer, dimension(:), intent(in) :: src1, src2
integer, dimension(:), allocatable :: res
integer :: i1, i2, i
allocate (res (size (src1) + size (src2)))
if (size (src1) == 0) then
    res = src2
    return
else if (size (src2) == 0) then
    res = src1
    return
end if
i1 = 1
i2 = 1
LOOP: do i = 1, size (res)
    if (src1(i1) < src2(i2)) then
        res(i) = src1(i1); i1 = i1 + 1
        if (i1 > size (src1)) then
            res(i+1:) = src2(i2:)
            exit LOOP
        end if
    else if (src1(i1) > src2(i2)) then
        res(i) = src2(i2); i2 = i2 + 1
        if (i2 > size (src2)) then
            res(i+1:) = src1(i1:)
            exit LOOP
        end if
    end if
else
    deallocate (res)
    exit LOOP
end subroutine combine_index_lists

```

```

    end if
end do LOOP
end subroutine combine_index_lists
```

This function is similar, but it does not actually merge the list, it just checks whether they are disjoint (no common `src` entry).

```

⟨Subevents: procedures⟩+≡
function index_lists_are_disjoint (src1, src2) result (flag)
logical :: flag
integer, dimension(:), intent(in) :: src1, src2
integer :: i1, i2, i
flag = .true.
i1 = 1
i2 = 1
LOOP: do i = 1, size (src1) + size (src2)
    if (src1(i1) < src2(i2)) then
        i1 = i1 + 1
        if (i1 > size (src1)) then
            exit LOOP
        end if
    else if (src1(i1) > src2(i2)) then
        i2 = i2 + 1
        if (i2 > size (src2)) then
            exit LOOP
        end if
    end if
    else
        flag = .false.
        exit LOOP
    end if
end do LOOP
end function index_lists_are_disjoint
```

### 12.4.2 subevents

Particles are collected in subevents. This type is implemented as a dynamically allocated array, which need not be completely filled. The value `n_active` determines the number of meaningful entries.

#### Type definition

```

⟨Subevents: public⟩+≡
public :: subevt_t

⟨Subevents: types⟩+≡
type :: subevt_t
private
integer :: n_active = 0
type(prt_t), dimension(:), allocatable :: prt
contains
⟨Subevents: subevt: TBP⟩
end type subevt_t
```

Initialize, allocating with size zero (default) or given size. The number of contained particles is set equal to the size.

```
(Subevents: public)+≡
    public :: subevt_init

(Subevents: procedures)+≡
    subroutine subevt_init (subevt, n_active)
        type(subevt_t), intent(out) :: subevt
        integer, intent(in), optional :: n_active
        if (present (n_active)) subevt%n_active = n_active
        allocate (subevt%prt (subevt%n_active))
    end subroutine subevt_init
```

(Re-)allocate the subevent with some given size. If the size is greater than the previous one, do a real reallocation. Otherwise, just reset the recorded size. Contents are untouched, but become invalid.

```
(Subevents: public)+≡
    public :: subevt_reset

(Subevents: procedures)+≡
    subroutine subevt_reset (subevt, n_active)
        type(subevt_t), intent(inout) :: subevt
        integer, intent(in) :: n_active
        subevt%n_active = n_active
        if (subevt%n_active > size (subevt%prt)) then
            deallocate (subevt%prt)
            allocate (subevt%prt (subevt%n_active))
        end if
    end subroutine subevt_reset
```

Output. No prefix for the headline 'subevt', because this will usually be printed appending to a previous line.

```
(Subevents: public)+≡
    public :: subevt_write

(Subevents: subevt: TBP)≡
    procedure :: write => subevt_write

(Subevents: procedures)+≡
    subroutine subevt_write (object, unit, prefix, pacified)
        class(subevt_t), intent(in) :: object
        integer, intent(in), optional :: unit
        character(*), intent(in), optional :: prefix
        logical, intent(in), optional :: pacified
        integer :: u, i
        u = given_output_unit (unit); if (u < 0) return
        write (u, "(1x,A)") "subevent:"
        do i = 1, object%n_active
            if (present (prefix)) write (u, "(A)", advance="no") prefix
            write (u, "(1x,I0)", advance="no") i
            call prt_write (object%prt(i), unit = unit, testflag = pacified)
        end do
    end subroutine subevt_write
```

Defined assignment: transfer only meaningful entries. This is a deep copy (as would be default assignment).

```

⟨Subevents: interfaces⟩+≡
  interface assignment(=)
    module procedure subevt_assign
  end interface

⟨Subevents: procedures⟩+≡
  subroutine subevt_assign (subevt, subevt_in)
    type(subevt_t), intent(inout) :: subevt
    type(subevt_t), intent(in) :: subevt_in
    if (.not. allocated (subevt%prt)) then
      call subevt_init (subevt, subevt_in%n_active)
    else
      call subevt_reset (subevt, subevt_in%n_active)
    end if
    subevt%prt(:subevt%n_active) = subevt_in%prt(:subevt%n_active)
  end subroutine subevt_assign

```

### Fill contents

## Operations with subevents

The join operation joins two subevents. When appending the elements of the second list, we check for each particle whether it is already in the first list. If yes, it is discarded. The result list should be initialized already.

If a mask is present, it refers to the second subevent. Particles where the mask is not set are discarded.

```

⟨Subevents: public⟩+≡
    public :: subevt_join

⟨Subevents: procedures⟩+≡
    subroutine subevt_join (subevt, pl1, pl2, mask2)
        type(subevt_t), intent(inout) :: subevt
        type(subevt_t), intent(in) :: pl1, pl2
        logical, dimension(:), intent(in), optional :: mask2
        integer :: n1, n2, i, n
        n1 = pl1%n_active
        n2 = pl2%n_active
        call subevt_reset (subevt, n1 + n2)
        subevt%prt(:n1) = pl1%prt(:n1)
        n = n1
        if (present (mask2)) then
            do i = 1, pl2%n_active
                if (mask2(i)) then
                    if (disjoint (i)) then
                        n = n + 1
                        subevt%prt(n) = pl2%prt(i)
                    end if
                end if
            end do
        else
            do i = 1, pl2%n_active
                if (disjoint (i)) then
                    n = n + 1
                    subevt%prt(n) = pl2%prt(i)
                end if
            end do
        end if
        subevt%n_active = n
    end subroutine subevt_join

```

```

contains
function disjoint (i) result (flag)
    integer, intent(in) :: i
    logical :: flag
    integer :: j
    do j = 1, pl1%n_active
        if (.not. are_disjoint (pl1%prt(j), pl2%prt(i))) then
            flag = .false.
            return
        end if
    end do
    flag = .true.
end function disjoint
end subroutine subevt_join

```

The combine operation makes a subevent whose entries are the result of adding (the momenta of) each pair of particles in the input lists. We trace the particles from which a particles is built by storing a `src` array. Each particle entry in the `src` list contains a list of indices which indicates its building blocks. The indices refer to an original list of particles. Index lists are sorted, and they contain no element more than once.

We thus require that in a given pseudoparticle, each original particle occurs at most once.

```

<Subevents: public>+≡
public :: subevt_combine

<Subevents: procedures>+≡
subroutine subevt_combine (subevt, pl1, pl2, mask12)
    type(subevt_t), intent(inout) :: subevt
    type(subevt_t), intent(in) :: pl1, pl2
    logical, dimension(:, :), intent(in), optional :: mask12
    integer :: n1, n2, i1, i2, n, j
    logical :: ok
    n1 = pl1%n_active
    n2 = pl2%n_active
    call subevt_reset (subevt, n1 * n2)
    n = 1
    do i1 = 1, n1
        do i2 = 1, n2
            if (present (mask12)) then
                ok = mask12(i1,i2)
            else
                ok = .true.
            end if
            if (ok) call prt_combine &
                (subevt%prt(n), pl1%prt(i1), pl2%prt(i2), ok)
            if (ok) then
                CHECK_DOUBLES: do j = 1, n - 1
                    if (subevt%prt(n) .match. subevt%prt(j)) then
                        ok = .false.; exit CHECK_DOUBLES
                    end if
                end do CHECK_DOUBLES
                if (ok) n = n + 1
            end if
        end do
    end do

```

```

        end if
    end do
end do
subevt%n_active = n - 1
end subroutine subevt_combine

```

The collect operation makes a single-entry subevent which results from combining (the momenta of) all particles in the input list. As above, the result does not contain an original particle more than once; this is checked for each particle when it is collected. Furthermore, each entry has a mask; where the mask is false, the entry is dropped.

(Thus, if the input particles are already composite, there is some chance that the result depends on the order of the input list and is not as expected. This situation should be avoided.)

```

<Subevents: public>+≡
public :: subevt_collect

<Subevents: procedures>+≡
subroutine subevt_collect (subevt, pl1, mask1)
    type(subevt_t), intent(inout) :: subevt
    type(subevt_t), intent(in) :: pl1
    logical, dimension(:), intent(in) :: mask1
    type(prt_t) :: prt
    integer :: i
    logical :: ok
    call subevt_reset (subevt, 1)
    subevt%n_active = 0
    do i = 1, pl1%n_active
        if (mask1(i)) then
            if (subevt%n_active == 0) then
                subevt%n_active = 1
                subevt%prt(1) = pl1%prt(i)
            else
                call prt_combine (prt, subevt%prt(1), pl1%prt(i), ok)
                if (ok) subevt%prt(1) = prt
            end if
        end if
    end do
end subroutine subevt_collect

```

The cluster operation is similar to `collect`, but applies a jet algorithm. The result is a subevent consisting of jets and, possibly, unclustered extra particles. As above, the result does not contain an original particle more than once; this is checked for each particle when it is collected. Furthermore, each entry has a mask; where the mask is false, the entry is dropped.

The algorithm: first determine the (pseudo)particles that participate in the clustering. They should not overlap, and the mask entry must be set. We then cluster the particles, using the given jet definition. The result particles are retrieved from the cluster sequence. We still have to determine the source indices for each jet: for each input particle, we get the jet index. Accumulating the source entries for all particles that are part of a given jet, we derive the jet

source entries. Finally, we delete the C structures that have been constructed by FastJet and its interface.

```

```

### 12.4.3 Eliminate numerical noise

This is useful for testing purposes: set entries to zero that are smaller in absolute values than a given tolerance parameter.

Note: instead of setting the tolerance in terms of EPSILON (kind-dependent), we fix it to  $10^{-16}$ , which is the typical value for double precision. The reason is that there are situations where intermediate representations (external libraries, files) are limited to double precision, even if the main program uses higher precision.

```

    end do
  end subroutine pacify_subevt

```

## 12.5 Analysis tools

This module defines structures useful for data analysis. These include observables, histograms, and plots.

Observables are quantities that are calculated and summed up event by event. At the end, one can compute the average and error.

Histograms have their bins in addition to the observable properties. Histograms are usually written out in tables and displayed graphically.

In plots, each record creates its own entry in a table. This can be used for scatter plots if called event by event, or for plotting dependencies on parameters if called once per integration run.

Graphs are container for histograms and plots, which carry their own graphics options.

The type layout is still somewhat obfuscated. This would become much simpler if type extension could be used.

character(*), parameter, public :: HISTOGRAM_INTG_FORMAT = "3x,I9,3x"
character(*), parameter, public :: HISTOGRAM_DATA_FORMAT = "ES19.12"

```

### 12.5.2 Graph options

These parameters are used for displaying data. They apply to a whole graph, which may contain more than one plot element.

The GAMELAN code chunks are part of both `graph_options` and `drawing_options`. The `drawing_options` copy is used in histograms and plots, also as graph elements. The `graph_options` copy is used for `graph` objects as a whole. Both copies are usually identical.

  obs%sum_weights = obs%sum_weights + abs (weight)
  obs%sum_squared_weights = obs%sum_squared_weights + weight**2
  obs%count = obs%count + 1
  if (present (success)) success = .true.
end subroutine observable_record_value_weighted

```

Here are the statistics formulas:

1. Unweighted case: Given a sample of  $n$  values  $x_i$ , the average is

$$\langle x \rangle = \frac{\sum x_i}{n} \quad (12.4)$$

and the error estimate

$$\Delta x = \sqrt{\frac{1}{n-1} \langle \sum (x_i - \langle x \rangle)^2 \rangle} \quad (12.5)$$

$$= \sqrt{\frac{1}{n-1} \left( \frac{\sum x_i^2}{n} - \frac{(\sum x_i)^2}{n^2} \right)} \quad (12.6)$$

2. Weighted case: Instead of weight 1, each event comes with weight  $w_i$ .

$$\langle x \rangle = \frac{\sum x_i w_i}{\sum w_i} \quad (12.7)$$

and

$$\Delta x = \sqrt{\frac{1}{n-1} \left( \frac{\sum x_i^2 w_i}{\sum w_i} - \frac{(\sum x_i w_i)^2}{(\sum w_i)^2} \right)} \quad (12.8)$$

For  $w_i = 1$ , this specializes to the previous formula.

                           obs_label, obs_unit, graph_options, drawing_options)

```

```
end subroutine histogram_init_bin_width
```

Initialize a histogram by copying another one.

Since `h` has no pointer (sub)components, intrinsic assignment is sufficient. Optionally, we replace the drawing options.

*(Analysis: procedures)*+≡

```
subroutine histogram_init_histogram (h, h_in, drawing_options)
  type(histogram_t), intent(out) :: h
  type(histogram_t), intent(in) :: h_in
  type(drawing_options_t), intent(in), optional :: drawing_options
  h = h_in
  if (present (drawing_options)) then
    h%drawing_options = drawing_options
  end if
end subroutine histogram_init_histogram
```

### Fill histograms

Clear the histogram contents, but do not modify the structure.

*(Analysis: procedures)*+≡

```
subroutine histogram_clear (h)
  type(histogram_t), intent(inout) :: h
  call observable_clear (h%obs)
  call observable_clear (h%obs_within_bounds)
  call bin_clear (h%underflow)
  if (allocated (h%bin)) call bin_clear (h%bin)
  call bin_clear (h%overflow)
end subroutine histogram_clear
```

Record a value. Successful if the value is within bounds, otherwise it is recorded as under-/overflow. Optionally, we may provide an excess weight that could be returned by the unweighting procedure.

*(Analysis: procedures)*+≡

```
subroutine histogram_record_value_unweighted (h, value, excess, success)
  type(histogram_t), intent(inout) :: h
  real(default), intent(in) :: value
  real(default), intent(in), optional :: excess

## Plots

*(Analysis: types)* +≡

```

type :: plot_t
  private
  type(point_t), pointer :: first => null ()
  type(point_t), pointer :: last => null ()
  integer :: count = 0
  type(graph_options_t) :: graph_options
  type(drawing_options_t) :: drawing_options
end type plot_t

```

## Initializer/finalizer

Initialize a plot. We provide the lower and upper bound in the  $x$  direction.

*(Analysis: interfaces)* +≡

```

interface plot_init
  module procedure plot_init_empty
  module procedure plot_init_plot
end interface

```

*(Analysis: procedures)* +≡

```

subroutine plot_init_empty (p, id, graph_options, drawing_options)
  type(plot_t), intent(out) :: p
  type(string_t), intent(in) :: id
  type(graph_options_t), intent(in), optional :: graph_options
  type(drawing_options_t), intent(in), optional :: drawing_options
  if (present (graph_options)) then
    p%graph_options = graph_options
  else
    call graph_options_init (p%graph_options)
  end if
  call graph_options_set (p%graph_options, id = id)
  if (present (drawing_options)) then
    p%drawing_options = drawing_options
  else
    call drawing_options_init_plot (p%drawing_options)
  end if
end subroutine plot_init_empty

```

Initialize a plot by copying another one, optionally merging in a new set of drawing options.

Since  $p$  has pointer (sub)components, we have to explicitly deep-copy the original.

*(Analysis: procedures)* +≡

```

subroutine plot_init_plot (p, p_in, drawing_options)
  type(plot_t), intent(out) :: p

```

```

type(plot_t), intent(in) :: p_in
type(drawing_options_t), intent(in), optional :: drawing_options
type(point_t), pointer :: current, new
current => p_in%first
do while (associated (current))
    allocate (new)
    call point_init (new, current)
    if (associated (p%last)) then
        p%last%next => new
    else
        p%first => new
    end if
    p%last => new
    current => current%next
end do
p%count = p_in%count
p%graph_options = p_in%graph_options
if (present (drawing_options)) then
    p%drawing_options = drawing_options
else
    p%drawing_options = p_in%drawing_options
end if
end subroutine plot_init_plot

```

Finalize the plot by deallocating the list of points.

*(Analysis: procedures)*+≡

```

subroutine plot_final (plot)
    type(plot_t), intent(inout) :: plot
    type(point_t), pointer :: current
    do while (associated (plot%first))
        current => plot%first
        plot%first => current%next
        deallocate (current)
    end do
    plot%last => null ()
end subroutine plot_final

```

### Fill plots

Clear the plot contents, but do not modify the structure.

*(Analysis: procedures)*+≡

```

subroutine plot_clear (plot)
    type(plot_t), intent(inout) :: plot
    plot%count = 0
    call plot_final (plot)
end subroutine plot_clear

```

Record a value. Successful if the value is within bounds, otherwise it is recorded as under-/overflow.

*(Analysis: procedures)*+≡

```

subroutine plot_record_value (plot, x, y, yerr, xerr, success)

```

```

type(plot_t), intent(inout) :: plot
real(default), intent(in) :: x, y
real(default), intent(in), optional :: yerr, xerr
logical, intent(out), optional :: success
type(point_t), pointer :: point
plot%count = plot%count + 1
allocate (point)
call point_init (point, x, y, yerr, xerr)
if (associated (plot%first)) then
    plot%last%next => point
else
    plot%first => point
end if
plot%last => point
if (present (success)) success = .true.
end subroutine plot_record_value

```

### Access contents

The number of points.

```

<Analysis: procedures>+≡

end subroutine plot_get_header

```

### 12.5.8 Graphs

A graph is a container for several graph elements. Each graph element is either a plot or a histogram. There is an appropriate base type below (the `analysis_object_t`), but to avoid recursion, we define a separate base type here. Note that there is no actual recursion: a graph is an analysis object, but a graph cannot contain graphs.

(If we could use type extension, the implementation would be much more transparent.)

#### Graph elements

Graph elements cannot be filled by the `record` command directly. The contents are always copied from elementary histograms or plots.

```
<Analysis: types>+≡
```

```

type :: graph_element_t
private
integer :: type = AN_UNDEFINED
type(histogram_t), pointer :: h => null ()
type(plot_t), pointer :: p => null ()
end type graph_element_t

```

*(Analysis: procedures)*+≡

```

subroutine graph_element_final (el)
type(graph_element_t), intent(inout) :: el
select case (el%type)
case (AN_HISTOGRAM)
    deallocate (el%h)
case (AN_PLOT)
    call plot_final (el%p)
    deallocate (el%p)
end select
el%type = AN_UNDEFINED
end subroutine graph_element_final

```

Return the number of entries in the graph element:

*(Analysis: procedures)*+≡

```

function graph_element_get_n_entries (el) result (n)
integer :: n
type(graph_element_t), intent(in) :: el
select case (el%type)
case (AN_HISTOGRAM); n = histogram_get_n_entries (el%h)
case (AN_PLOT);       n = plot_get_n_entries (el%p)
case default;         n = 0
end select
end function graph_element_get_n_entries

```

Return a pointer to the graph / drawing options.

*(Analysis: procedures)*+≡

```

function graph_element_get_graph_options_ptr (el) result (ptr)
type(graph_options_t), pointer :: ptr
type(graph_element_t), intent(in) :: el
select case (el%type)
case (AN_HISTOGRAM); ptr => histogram_get_graph_options_ptr (el%h)
case (AN_PLOT);       ptr => plot_get_graph_options_ptr (el%p)
case default;         ptr => null ()
end select
end function graph_element_get_graph_options_ptr

function graph_element_get_drawing_options_ptr (el) result (ptr)
type(drawing_options_t), pointer :: ptr
type(graph_element_t), intent(in) :: el
select case (el%type)
case (AN_HISTOGRAM); ptr => histogram_get_drawing_options_ptr (el%h)
case (AN_PLOT);       ptr => plot_get_drawing_options_ptr (el%p)
case default;         ptr => null ()
end select

```

```
end function graph_element_get_drawing_options_ptr
```

Output, simple wrapper for the plot/histogram writer.

*(Analysis: procedures)*+≡

```
subroutine graph_element_write (el, unit)
  type(graph_element_t), intent(in) :: el
  integer, intent(in), optional :: unit
  type(graph_options_t), pointer :: gro
  type(string_t) :: id
  integer :: u
  u = given_output_unit (unit); if (u < 0) return
  gro => graph_element_get_graph_options_ptr (el)
  id = graph_options_get_id (gro)
  write (u, "(A,A)" '#, repeat ("-", 78)
  select case (el%type)
  case (AN_HISTOGRAM)
    write (u, "(A)", advance="no") "# Histogram: "
    write (u, "(1x,A)") char (id)
    call histogram_write (el%h, unit)
  case (AN_PLOT)
    write (u, "(A)", advance="no") "# Plot: "
    write (u, "(1x,A)") char (id)
    call plot_write (el%p, unit)
  end select
end subroutine graph_element_write
```

*(Analysis: procedures)*+≡

```
subroutine graph_element_write_gml_reader (el, filename, unit)
  type(graph_element_t), intent(in) :: el
  type(string_t), intent(in) :: filename
  integer, intent(in), optional :: unit
  select case (el%type)
  case (AN_HISTOGRAM); call histogram_write_gml_reader (el%h, filename, unit)
  case (AN_PLOT);       call plot_write_gml_reader (el%p, filename, unit)
  end select
end subroutine graph_element_write_gml_reader
```

## The graph type

The actual graph type contains its own `graph_options`, which override the individual settings. The `drawing_options` are set in the graph elements. This distinction motivates the separation of the two types.

*(Analysis: types)*+≡

```
type :: graph_t
  private
  type(graph_element_t), dimension(:), allocatable :: el
  type(graph_options_t) :: graph_options
end type graph_t
```

## Initializer/finalizer

The graph is created with a definite number of elements. The elements are filled one by one, optionally with modified drawing options.

*(Analysis: procedures)*+≡

```
subroutine graph_init (g, id, n_elements, graph_options)
    type(graph_t), intent(out) :: g
    type(string_t), intent(in) :: id
    integer, intent(in) :: n_elements
    type(graph_options_t), intent(in), optional :: graph_options
    allocate (g%el (n_elements))
    if (present (graph_options)) then
        g%graph_options = graph_options
    else
        call graph_options_init (g%graph_options)
    end if
    call graph_options_set (g%graph_options, id = id)
end subroutine graph_init
```

*(Analysis: procedures)*+≡

```
subroutine graph_insert_histogram (g, i, h, drawing_options)
    type(graph_t), intent(inout), target :: g
    integer, intent(in) :: i
    type(histogram_t), intent(in) :: h
    type(drawing_options_t), intent(in), optional :: drawing_options
    type(graph_options_t), pointer :: gro
    type(drawing_options_t), pointer :: dro
    type(string_t) :: id
    g%el(i)%type = AN_HISTOGRAM
    allocate (g%el(i)%h)
    call histogram_init_histogram (g%el(i)%h, h, drawing_options)
    gro => histogram_get_graph_options_ptr (g%el(i)%h)
    dro => histogram_get_drawing_options_ptr (g%el(i)%h)
    id = graph_options_get_id (gro)
    call drawing_options_set (dro, dataset = "dat." // id)
end subroutine graph_insert_histogram
```

*(Analysis: procedures)*+≡

```
subroutine graph_insert_plot (g, i, p, drawing_options)
    type(graph_t), intent(inout) :: g
    integer, intent(in) :: i
    type(plot_t), intent(in) :: p
    type(drawing_options_t), intent(in), optional :: drawing_options
    type(graph_options_t), pointer :: gro
    type(drawing_options_t), pointer :: dro
    type(string_t) :: id
    g%el(i)%type = AN_PLOT
    allocate (g%el(i)%p)
    call plot_init_plot (g%el(i)%p, p, drawing_options)
    gro => plot_get_graph_options_ptr (g%el(i)%p)
    dro => plot_get_drawing_options_ptr (g%el(i)%p)
    id = graph_options_get_id (gro)
    call drawing_options_set (dro, dataset = "dat." // id)
```

```
end subroutine graph_insert_plot
```

Finalizer.

```
(Analysis: procedures)+≡
subroutine graph_final (g)
    type(graph_t), intent(inout) :: g
    integer :: i
    do i = 1, size (g%el)
        call graph_element_final (g%el(i))
    end do
    deallocate (g%el)
end subroutine graph_final
```

## Access contents

The number of elements.

```
(Analysis: procedures)+≡
function graph_get_n_elements (graph) result (n)
    integer :: n
    type(graph_t), intent(in) :: graph
    n = size (graph%el)
end function graph_get_n_elements
```

Retrieve a pointer to the drawing options of an element, so they can be modified. (The `target` attribute is not actually needed because the components are pointers.)

```
(Analysis: procedures)+≡
function graph_get_drawing_options_ptr (g, i) result (ptr)
    type(drawing_options_t), pointer :: ptr
    type(graph_t), intent(in), target :: g
    integer, intent(in) :: i
    ptr => graph_element_get_drawing_options_ptr (g%el(i))
end function graph_get_drawing_options_ptr
```

## Output

The default output format just writes histogram and plot data.

```
(Analysis: procedures)+≡
subroutine graph_write (graph, unit)
    type(graph_t), intent(in) :: graph
    integer, intent(in), optional :: unit
    integer :: i
    do i = 1, size (graph%el)
        call graph_element_write (graph%el(i), unit)
    end do
end subroutine graph_write
```

The GAMELAN driver is not a simple wrapper, but it writes the plot/histogram contents embedded the complete graph. First, data are read in, global background commands next, then individual elements, then global foreground commands.

```
(Analysis: procedures) +≡
subroutine graph_write_gml_driver (g, filename, unit)
  type(graph_t), intent(in) :: g
  type(string_t), intent(in) :: filename
  type(string_t) :: calc_cmd, bg_cmd, draw_cmd, err_cmd, symb_cmd, fg_cmd
  integer, intent(in), optional :: unit
  type(drawing_options_t), pointer :: dro
  integer :: u, i
  u = given_output_unit (unit); if (u < 0) return
  call graph_options_write_tex_header (g%graph_options, unit)
  write (u, "(2x,A)") &
    char (graph_options_get_gml_setup (g%graph_options))
  write (u, "(2x,A)") &

    c // "number of graph elements: " &
    // int2char (graph_get_n_elements (graph)))
end subroutine graph_get_header

```

### 12.5.9 Analysis objects

This data structure holds all observables, histograms and such that are currently active. We have one global store; individual items are identified by their ID strings.

(This should rather be coded by type extension.)

```

<Analysis: parameters>+≡
    integer, parameter :: AN_UNDEFINED = 0
    integer, parameter :: AN_OBSERVABLE = 1
    integer, parameter :: AN_HISTOGRAM = 2
    integer, parameter :: AN_PLOT = 3
    integer, parameter :: AN_GRAPH = 4

<Analysis: public>+≡
    public :: AN_UNDEFINED, AN_HISTOGRAM, AN_OBSERVABLE, AN_PLOT, AN_GRAPH

<Analysis: types>+≡
    type :: analysis_object_t
        private
        type(string_t) :: id
        integer :: type = AN_UNDEFINED
        type(observable_t), pointer :: obs => null ()
        type(histogram_t), pointer :: h => null ()
        type(plot_t), pointer :: p => null ()
        type(graph_t), pointer :: g => null ()
        type(analysis_object_t), pointer :: next => null ()
    end type analysis_object_t

```

#### Initializer/finalizer

Allocate with the correct type but do not fill initial values.

```

<Analysis: procedures>+≡
    subroutine analysis_object_init (obj, id, type)
        type(analysis_object_t), intent(out) :: obj
        type(string_t), intent(in) :: id
        integer, intent(in) :: type
        obj%id = id
        obj%type = type
        select case (obj%type)

```

```

    case (AN_OBSERVABLE);  allocate (obj%obs)
    case (AN_HISTOGRAM);   allocate (obj%h)
    case (AN_PLOT);        allocate (obj%p)
    case (AN_GRAPH);       allocate (obj%g)
    end select
end subroutine analysis_object_init

```

*(Analysis: procedures)*+≡

```

subroutine analysis_object_final (obj)
type(analysis_object_t), intent(inout) :: obj
select case (obj%type)
case (AN_OBSERVABLE)
    deallocate (obj%obs)
case (AN_HISTOGRAM)
    deallocate (obj%h)
case (AN_PLOT)
    call plot_final (obj%p)
    deallocate (obj%p)
case (AN_GRAPH)
    call graph_final (obj%g)
    deallocate (obj%g)
end select
obj%type = AN_UNDEFINED
end subroutine analysis_object_final

```

Clear the analysis object, i.e., reset it to its initial state. Not applicable to graphs, which are always combinations of other existing objects.

*(Analysis: procedures)*+≡

```

subroutine analysis_object_clear (obj)
type(analysis_object_t), intent(inout) :: obj
select case (obj%type)
case (AN_OBSERVABLE)
    call observable_clear (obj%obs)
case (AN_HISTOGRAM)
    call histogram_clear (obj%h)
case (AN_PLOT)
    call plot_clear (obj%p)
end select
end subroutine analysis_object_clear

```

### Fill with data

Record data. The effect depends on the type of analysis object.

*(Analysis: procedures)*+≡

```

subroutine analysis_object_record_data (obj, &
                                         x, y, yerr, xerr, weight, excess, success)
type(analysis_object_t), intent(inout) :: obj
real(default), intent(in) :: x
real(default), intent(in), optional :: y, yerr, xerr, weight, excess
logical, intent(out), optional :: success
select case (obj%type)

```

```

case (AN_OBSERVABLE)
  if (present (weight)) then
    call observable_record_value_weighted (obj%obs, x, weight, success)
  else
    call observable_record_value_unweighted (obj%obs, x, success)
  end if
case (AN_HISTOGRAM)
  if (present (weight)) then
    call histogram_record_value_weighted (obj%h, x, weight, success)
  else
    call histogram_record_value_unweighted (obj%h, x, excess, success)
  end if
case (AN_PLOT)
  if (present (y)) then
    call plot_record_value (obj%p, x, y, yerr, xerr, success)
  else
    if (present (success)) success = .false.
  end if
case default
  if (present (success)) success = .false.
end select
end subroutine analysis_object_record_data

```

Explicitly set the pointer to the next object in the list.

*(Analysis: procedures)*+≡

```

subroutine analysis_object_set_next_ptr (obj, next)
  type(analysis_object_t), intent(inout) :: obj
  type(analysis_object_t), pointer :: next
  obj%next => next
end subroutine analysis_object_set_next_ptr

```

### Access contents

Return a pointer to the next object in the list.

*(Analysis: procedures)*+≡

```

function analysis_object_get_next_ptr (obj) result (next)
  type(analysis_object_t), pointer :: next
  type(analysis_object_t), intent(in) :: obj
  next => obj%next
end function analysis_object_get_next_ptr

```

Return data as appropriate for the object type.

*(Analysis: procedures)*+≡

```

function analysis_object_get_n_elements (obj) result (n)
  integer :: n
  type(analysis_object_t), intent(in) :: obj
  select case (obj%type)
  case (AN_HISTOGRAM)
    n = 1
  case (AN_PLOT)
    n = 1
  end select
end function analysis_object_get_n_elements

```

```

    case (AN_GRAPH)
        n = graph_get_n_elements (obj%g)
    case default
        n = 0
    end select
end function analysis_object_get_n_elements

function analysis_object_get_n_entries (obj, within_bounds) result (n)

    else
        err = histogram_get_error (obj%h)
    end if
case default
    err = 0
end select
end function analysis_object_get_error

```

Return pointers to the actual contents:

```

<Analysis: procedures>+≡
function analysis_object_get_observable_ptr (obj) result (obs)
    type(observable_t), pointer :: obs
    type(analysis_object_t), intent(in) :: obj
    select case (obj%type)
    case (AN_OBSERVABLE);  obs => obj%obs
    case default;          obs => null ()
    end select
end function analysis_object_get_observable_ptr

function analysis_object_get_histogram_ptr (obj) result (h)
    type(histogram_t), pointer :: h
    type(analysis_object_t), intent(in) :: obj
    select case (obj%type)
    case (AN_HISTOGRAM);  h => obj%h
    case default;          h => null ()
    end select
end function analysis_object_get_histogram_ptr

function analysis_object_get_plot_ptr (obj) result (plot)
    type(plot_t), pointer :: plot
    type(analysis_object_t), intent(in) :: obj
    select case (obj%type)
    case (AN_PLOT);   plot => obj%p
    case default;     plot => null ()
    end select
end function analysis_object_get_plot_ptr

function analysis_object_get_graph_ptr (obj) result (g)
    type(graph_t), pointer :: g
    type(analysis_object_t), intent(in) :: obj
    select case (obj%type)
    case (AN_GRAPH);  g => obj%g
    case default;      g => null ()
    end select
end function analysis_object_get_graph_ptr

```

Return true if the object has a graphical representation:

```
<Analysis: procedures>+≡
    function analysis_object_has_plot (obj) result (flag)
        logical :: flag
        type(analysis_object_t), intent(in) :: obj
        select case (obj%type)
            case (AN_HISTOGRAM); flag = .true.
            case (AN_PLOT);       flag = .true.
            case (AN_GRAPH);     flag = .true.
            case default;         flag = .false.
        end select
    end function analysis_object_has_plot
```

## Output

```
<Analysis: procedures>+≡
    subroutine analysis_object_write (obj, unit, verbose)
        type(analysis_object_t), intent(in) :: obj
        integer, intent(in), optional :: unit
        logical, intent(in), optional :: verbose
        logical :: verb
        integer :: u

    case (AN_PLOT)
        call plot_get_header (obj%p, header, comment)
    end select
end subroutine analysis_object_get_header

```

### 12.5.10 Analysis object iterator

Analysis objects are containers which have iterable data structures: histograms/bins and plots/points. If they are to be treated on a common basis, it is useful to have an iterator which hides the implementation details.

The iterator is used only for elementary analysis objects that contain plot data: histograms or plots. It is invalid for meta-objects (graphs) and non-graphical objects (observables).

*(Analysis: public)*+≡

```

public :: analysis_iterator_t
<Analysis: types>+≡
    type :: analysis_iterator_t
    private
    integer :: type = AN_UNDEFINED
    type(analysis_object_t), pointer :: object => null ()
    integer :: index = 1
    type(point_t), pointer :: point => null ()
end type

```

The initializer places the iterator at the beginning of the analysis object.

```

<Analysis: procedures>+≡
    subroutine analysis_iterator_init (iterator, object)
        type(analysis_iterator_t), intent(out) :: iterator
        type(analysis_object_t), intent(in), target :: object
        iterator%object => object
        if (associated (iterator%object)) then
            iterator%type = iterator%object%type
            select case (iterator%type)
            case (AN_PLOT)
                iterator%point => iterator%object%p%first
            end select
        end if
    end subroutine analysis_iterator_init

```

The iterator is valid as long as it points to an existing entry. An iterator for a data object without array data (observable) is always invalid.

```

<Analysis: public>+≡
    public :: analysis_iterator_is_valid

<Analysis: procedures>+≡
    function analysis_iterator_is_valid (iterator) result (valid)
        logical :: valid
        type(analysis_iterator_t), intent(in) :: iterator
        if (associated (iterator%object)) then
            select case (iterator%type)
            case (AN_HISTOGRAM)
                valid = iterator%index <= histogram_get_n_bins (iterator%object%h)
            case (AN_PLOT)
                valid = associated (iterator%point)
            case default
                valid = .false.
            end select
        else
            valid = .false.
        end if
    end function analysis_iterator_is_valid

```

Advance the iterator.

```

<Analysis: public>+≡
    public :: analysis_iterator_advance

```

```

⟨Analysis: procedures⟩+≡
    subroutine analysis_iterator_advance (iterator)
        type(analysis_iterator_t), intent(inout) :: iterator
        if (associated (iterator%object)) then
            select case (iterator%type)
            case (AN_PLOT)
                iterator%point => iterator%point%next
            end select
            iterator%index = iterator%index + 1
        end if
    end subroutine analysis_iterator_advance

```

Retrieve the object type:

```

⟨Analysis: public⟩+≡
    public :: analysis_iterator_get_type
⟨Analysis: procedures⟩+≡
    function analysis_iterator_get_type (iterator) result (type)
        integer :: type
        type(analysis_iterator_t), intent(in) :: iterator
        type = iterator%type
    end function analysis_iterator_get_type

```

Use the iterator to retrieve data. We implement a common routine which takes the data descriptors as optional arguments. Data which do not occur in the selected type trigger to an error condition.

The iterator must point to a valid entry.

```

⟨Analysis: public⟩+≡
    public :: analysis_iterator_get_data
⟨Analysis: procedures⟩+≡
    subroutine analysis_iterator_get_data (iterator, &
        x, y, yerr, xerr, width, excess, index, n_total)

### 12.5.11 Analysis store

This data structure holds all observables, histograms and such that are currently active. We have one global store; individual items are identified by their ID strings and types.

*(Analysis: variables)*≡  
 type(analysis\_store\_t), save :: analysis\_store

*(Analysis: types)*+≡  
 type :: analysis\_store\_t  
 private  
 type(analysis\_object\_t), pointer :: first => null ()  
 type(analysis\_object\_t), pointer :: last => null ()  
 end type analysis\_store\_t

Delete the analysis store

*(Analysis: public)*+≡  
 public :: analysis\_final  
*(Analysis: procedures)*+≡  
 subroutine analysis\_final ()  
 type(analysis\_object\_t), pointer :: current

```

do while (associated (analysis_store%first))
    current => analysis_store%first
    analysis_store%first => current%next
    call analysis_object_final (current)
end do
analysis_store%last => null ()
end subroutine analysis_final

```

Append a new analysis object

```

<Analysis: procedures>+≡
subroutine analysis_store_append_object (id, type)
    type(string_t), intent(in) :: id
    integer, intent(in) :: type
    type(analysis_object_t), pointer :: obj
    allocate (obj)
    call analysis_object_init (obj, id, type)
    if (associated (analysis_store%last)) then
        analysis_store%last%next => obj
    else
        analysis_store%first => obj
    end if
    analysis_store%last => obj
end subroutine analysis_store_append_object

```

Return a pointer to the analysis object with given ID.

```

<Analysis: procedures>+≡
function analysis_store_get_object_ptr (id) result (obj)
    type(string_t), intent(in) :: id
    type(analysis_object_t), pointer :: obj
    obj => analysis_store%first
    do while (associated (obj))
        if (obj%id == id) return
        obj => obj%next
    end do
end function analysis_store_get_object_ptr

```

Initialize an analysis object: either reset it if present, or append a new entry.

```

<Analysis: procedures>+≡
subroutine analysis_store_init_object (id, type, obj)
    type(string_t), intent(in) :: id
    integer, intent(in) :: type
    type(analysis_object_t), pointer :: obj, next
    obj => analysis_store_get_object_ptr (id)
    if (associated (obj)) then
        next => analysis_object_get_next_ptr (obj)
        call analysis_object_final (obj)
        call analysis_object_init (obj, id, type)
        call analysis_object_set_next_ptr (obj, next)
    else
        call analysis_store_append_object (id, type)
        obj => analysis_store%last
    end if

```

```
end subroutine analysis_store_init_object
```

Get the type of a analysis object

```
<Analysis: public>+≡  
    public :: analysis_store_get_object_type  
<Analysis: procedures>+≡  
    function analysis_store_get_object_type (id) result (type)  
        type(string_t), intent(in) :: id  
        integer :: type  
        type(analysis_object_t), pointer :: object  
        object => analysis_store_get_object_ptr (id)  
        if (associated (object)) then  
            type = object%type  
        else  
            type = AN_UNDEFINED  
        end if  
    end function analysis_store_get_object_type
```

Return the number of objects in the store.

```
<Analysis: procedures>+≡  
    function analysis_store_get_n_objects () result (n)  
        integer :: n  
        type(analysis_object_t), pointer :: current  
        n = 0  
        current => analysis_store%first  
        do while (associated (current))  
            n = n + 1  
            current => current%next  
        end do  
    end function analysis_store_get_n_objects
```

Allocate an array and fill it with all existing IDs.

```
<Analysis: public>+≡  
    public :: analysis_store_get_ids  
<Analysis: procedures>+≡  
    subroutine analysis_store_get_ids (id)  
        type(string_t), dimension(:), allocatable, intent(out) :: id  
        type(analysis_object_t), pointer :: current  
        integer :: i  
        allocate (id (analysis_store_get_n_objects()))  
        i = 0  
        current => analysis_store%first  
        do while (associated (current))  
            i = i + 1  
            id(i) = current%id  
            current => current%next  
        end do  
    end subroutine analysis_store_get_ids
```

### 12.5.12 L<sup>A</sup>T<sub>E</sub>X driver file

Write a driver file for all objects in the store.

*(Analysis: procedures)*+≡

```

subroutine analysis_store_write_driver_all (filename_data, unit)
    type(string_t), intent(in) :: filename_data
    integer, intent(in), optional :: unit
    type(analysis_object_t), pointer :: obj
    call analysis_store_write_driver_header (unit)
    obj => analysis_store%first
    do while (associated (obj))
        call analysis_object_write_driver (obj, filename_data, unit)
        obj => obj%next
    end do
    call analysis_store_write_driver_footer (unit)
end subroutine analysis_store_write_driver_all

```

Write a driver file for an array of objects.

*(Analysis: procedures)*+≡

```

subroutine analysis_store_write_driver_obj (filename_data, id, unit)
    type(string_t), intent(in) :: filename_data
    type(string_t), dimension(:), intent(in) :: id
    integer, intent(in), optional :: unit
    type(analysis_object_t), pointer :: obj
    integer :: i
    call analysis_store_write_driver_header (unit)
    do i = 1, size (id)
        obj => analysis_store_get_object_ptr (id(i))
        if (associated (obj)) &
            call analysis_object_write_driver (obj, filename_data, unit)
    end do
    call analysis_store_write_driver_footer (unit)
end subroutine analysis_store_write_driver_obj

```

The beginning of the driver file.

*(Analysis: procedures)*+≡

```

subroutine analysis_store_write_driver_header (unit)
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit);  if (u < 0)  return
    write (u, '(A)') "\documentclass[12pt]{article}"
    write (u, *)
    write (u, '(A)') "\usepackage{gamelan}"

  call analysis_store_init_object (id, AN_GRAPH, obj)
  graph => analysis_object_get_graph_ptr (obj)
  call graph_init (graph, id, n_elements, graph_options)
end subroutine analysis_init_graph

```

## Recording data

This procedure resets an object or the whole store to its initial state.

```

⟨Analysis: public⟩+≡
public :: analysis_clear

⟨Analysis: interfaces⟩+≡
interface analysis_clear
  module procedure analysis_store_clear_obj
  module procedure analysis_store_clear_all
end interface

⟨Analysis: procedures⟩+≡
subroutine analysis_store_clear_obj (id)
  type(string_t), intent(in) :: id
  type(analysis_object_t), pointer :: obj
  obj => analysis_store_get_object_ptr (id)
  if (associated (obj)) then
    call analysis_object_clear (obj)
  end if
end subroutine analysis_store_clear_obj

subroutine analysis_store_clear_all ()
  type(analysis_object_t), pointer :: obj
  obj => analysis_store%first
  do while (associated (obj))
    call analysis_object_clear (obj)
    obj => obj%next
  end do
end subroutine analysis_store_clear_all

```

There is one generic recording function whose behavior depends on the type of analysis object.

```

⟨Analysis: public⟩+≡
public :: analysis_record_data

```

```

⟨Analysis: procedures⟩+≡
    subroutine analysis_record_data (id, x, y, yerr, xerr, &
        weight, excess, success, exist)
        type(string_t), intent(in) :: id
        real(default), intent(in) :: x
        real(default), intent(in), optional :: y, yerr, xerr, weight, excess
        logical, intent(out), optional :: success, exist
        type(analysis_object_t), pointer :: obj
        obj => analysis_store_get_object_ptr (id)
        if (associated (obj)) then
            call analysis_object_record_data (obj, x, y, yerr, xerr, &
                weight, excess, success)
            if (present (exist)) exist = .true.
        else
            if (present (success)) success = .false.
            if (present (exist)) exist = .false.
        end if
    end subroutine analysis_record_data

```

### Build a graph

This routine sets up the array of graph elements by copying the graph elements given as input. The object must exist and already be initialized as a graph.

```

⟨Analysis: public⟩+≡
    public :: analysis_fill_graph
⟨Analysis: procedures⟩+≡
    subroutine analysis_fill_graph (id, i, id_in, drawing_options)
        type(string_t), intent(in) :: id
        integer, intent(in) :: i
        type(string_t), intent(in) :: id_in
        type(drawing_options_t), intent(in), optional :: drawing_options
        type(analysis_object_t), pointer :: obj
        type(graph_t), pointer :: g
        type(histogram_t), pointer :: h
        type(plot_t), pointer :: p
        obj => analysis_store_get_object_ptr (id)
        g => analysis_object_get_graph_ptr (obj)
        obj => analysis_store_get_object_ptr (id_in)
        if (associated (obj)) then
            select case (obj%type)
            case (AN_HISTOGRAM)
                h => analysis_object_get_histogram_ptr (obj)
                call graph_insert_histogram (g, i, h, drawing_options)
            case (AN_PLOT)
                p => analysis_object_get_plot_ptr (obj)
                call graph_insert_plot (g, i, p, drawing_options)
            case default
                call msg_error ("Graph '" // char (id) // "': Element '" &
                    // char (id_in) // "' is neither histogram nor plot.")
            end select
        else
            call msg_error ("Graph '" // char (id) // "': Element '" &

```

```

        // char (id_in) // '' is undefined.")
    end if
end subroutine analysis_fill_graph

```

### Retrieve generic results

Check if a named object exists.

```

⟨Analysis: public⟩+≡
    public :: analysis_exists

⟨Analysis: procedures⟩+≡
    function analysis_exists (id) result (flag)
        type(string_t), intent(in) :: id
        logical :: flag
        type(analysis_object_t), pointer :: obj
        flag = .true.
        obj => analysis_store%first
        do while (associated (obj))
            if (obj%id == id)  return
            obj => obj%next
        end do
        flag = .false.
    end function analysis_exists

```

The following functions should work for all kinds of analysis object:

```

⟨Analysis: public⟩+≡
    public :: analysis_get_n_elements
    public :: analysis_get_n_entries
    public :: analysis_get_average
    public :: analysis_get_error

⟨Analysis: procedures⟩+≡
    function analysis_get_n_elements (id) result (n)
        integer :: n
        type(string_t), intent(in) :: id
        type(analysis_object_t), pointer :: obj
        obj => analysis_store_get_object_ptr (id)
        if (associated (obj)) then
            n = analysis_object_get_n_elements (obj)
        else
            n = 0
        end if
    end function analysis_get_n_elements

    function analysis_get_n_entries (id, within_bounds) result (n)
        integer :: n
        type(string_t), intent(in) :: id
        logical, intent(in), optional :: within_bounds
        type(analysis_object_t), pointer :: obj
        obj => analysis_store_get_object_ptr (id)
        if (associated (obj)) then
            n = analysis_object_get_n_entries (obj, within_bounds)
        else

```

```

        n = 0
    end if
end function analysis_get_n_entries

function analysis_get_average (id, within_bounds) result (avg)
    real(default) :: avg
    type(string_t), intent(in) :: id
    type(analysis_object_t), pointer :: obj
    logical, intent(in), optional :: within_bounds
    obj => analysis_store_get_object_ptr (id)
    if (associated (obj)) then
        avg = analysis_object_get_average (obj, within_bounds)
    else
        avg = 0
    end if
end function analysis_get_average

function analysis_get_error (id, within_bounds) result (err)
    real(default) :: err
    type(string_t), intent(in) :: id
    type(analysis_object_t), pointer :: obj
    logical, intent(in), optional :: within_bounds
    obj => analysis_store_get_object_ptr (id)
    if (associated (obj)) then
        err = analysis_object_get_error (obj, within_bounds)
    else
        err = 0
    end if
end function analysis_get_error

```

Return true if any analysis object is graphical

```

⟨Analysis: public⟩+≡
public :: analysis_has_plots

⟨Analysis: interfaces⟩+≡
interface analysis_has_plots
    module procedure analysis_has_plots_any
    module procedure analysis_has_plots_obj
end interface

```

```

⟨Analysis: procedures⟩+≡
function analysis_has_plots_any () result (flag)
    logical :: flag
    type(analysis_object_t), pointer :: obj
    flag = .false.
    obj => analysis_store%first
    do while (associated (obj))
        flag = analysis_object_has_plot (obj)
        if (flag)  return
    end do
end function analysis_has_plots_any

function analysis_has_plots_obj (id) result (flag)
    logical :: flag

```

```

type(string_t), dimension(:), intent(in) :: id
type(analysis_object_t), pointer :: obj
integer :: i
flag = .false.
do i = 1, size (id)
    obj => analysis_store_get_object_ptr (id(i))
    if (associated (obj)) then
        flag = analysis_object_has_plot (obj)
        if (flag)  return
    end if
end do
end function analysis_has_plots_obj

```

## Iterators

Initialize an iterator for the given object. If the object does not exist or has wrong type, the iterator will be invalid.

```

<Analysis: public>+≡
public :: analysis_init_iterator

<Analysis: procedures>+≡
subroutine analysis_init_iterator (id, iterator)
    type(string_t), intent(in) :: id
    type(analysis_iterator_t), intent(out) :: iterator

# Chapter 13

## Matrix Element Handling

In this chapter, we support internal and external matrix elements: initialization, automatic generation where necessary, and numerical evaluation. We provide the interface for code generation and linking. Matrix-element code is organized in processes and process libraries.

**process\_constants** A record of static process properties, for easy transfer between various WHIZARD modules.

**prclib\_interfaces** This module deals with matrix-element code which is accessible via external libraries (Fortran libraries or generic C-compatible libraries) and must either be generated by the program or provided by the user explicitly.

The module defines and uses an abstract type `prc_writer_t` and two abstract extensions, one for a Fortran module and one for a C-compatible library. The implementation provides the specific methods for writing the appropriate parts in external matrix element code.

**prc\_core\_def** This module defines the abstract types `prc_core_def_t` and `prc_driver_t`. The implementation of the former provides the configuration for processes of a certain class, while the latter accesses the corresponding matrix element, in particular those generated by the appropriate `prc_writer_t` object.

**process\_libraries** This module combines the functionality of the previous module with the means for holding processes definitions (the internal counterpart of appropriate declarations in the user interface), for handling matrix elements which do not need external code, and for accessing the matrix elements by the procedures for matrix-element evaluation, integration and event generation.

**prclib\_stacks** Collect process libraries.

**test\_me** This module provides a test implementation for the abstract types in the `prc_core_def` module. The implementation is intended for self-tests of several later modules. The implementation is internal, i.e., no external code has been generated.

All data structures which are specific for a particular way of generating code or evaluating matrix element are kept abstract and thus generic. Later modules such as `prc_omega` provide implementations, in the form of type extensions for the various abstract types.

### 13.1 Process data block

We define a simple transparent type that contains universal constant process data. We will reference objects of this type for the phase-space setup, for interfacing with process libraries, for implementing matrix-element generation, and in the master process-handling module.

*<process\_constants.f90>*≡  
  *<File header>*

```
module process_constants

<Use kinds>
<Use strings>

<Standard module head>

<Process constants: public>

<Process constants: types>

contains

<Process constants: procedures>
```

```
end module process_constants
```

The data type is just a block of public objects, only elementary types, no type-bound procedures.

*<Process constants: public>*≡  
  public :: process\_constants\_t

```
<Process constants: types>≡
  type :: process_constants_t

## 13.2 Process library interface

The module `prclib_interfaces` handles external matrix-element code.

### 13.2.1 Overview

The top-level data structure is the `prclib_driver_t` data type. The associated type-bound procedures deal with the generation of external code, compilation and linking, and accessing the active external library.

An object of type `prclib_driver_t` consists of the following parts:

1. Metadata that identify name and status of the library driver, etc.
2. An array of process records (`prclib_driver_record_t`), one for each external matrix element.
3. A record of type `dlaccess_t` which handles the operating-system part of linking a dynamically loadable library.
4. A collection of procedure pointers which have a counterpart in the external library interface. Given the unique identifier of a matrix element, the procedures retrieve generic matrix-element information such as the particle content and helicity combination tables. There is also a procedure which returns pointers to the more specific procedures that a matrix element provides, called *features*.

The process records of type `prclib_driver_record_t` handle the individual matrix elements. Each record identifies a process by name (`id`), names the physics model to be loaded for this process, lists the features that the associated matrix-element code provides, and holds a `writer` object which handles all operations that depend on the process type. The numbering of process records is identical to the numbering of matrix-element codes in the external library.

The writer object is of abstract type `prc_writer_t`. The module defines two basic, also abstract, extensions: `prc_writer_f_module_t` and `prc_writer_c_lib_t`. The first version is for matrix-element code that is available in form of Fortran modules. The writer contains type-bound procedures which create appropriate `use` directives and C-compatible wrapper functions for the given set of Fortran modules and their features. The second version is for matrix-element code that is available in form of a C-compatible library (this includes Fortran libraries with proper C bindings). The writer needs not write wrapper function, but explicit interface blocks for the matrix-element features.

Each matrix-element variant is encoded in an appropriate extension of `prc_writer_t`. For instance, O'MEGA matrix elements provide an implementation `omega_writer_t` which extends `prc_writer_f_module_t`.

### 13.2.2 Workflow

We expect that the functionality provided by this module is called in the following order:

1. The caller initializes the `prclib_driver_t` object and fills the array of `prclib_record_t` entries with the appropriate process data and process-specific writer objects.
2. It calls the `generate_makefile` method to set up an appropriate makefile in the current directory. The makefile will handle source generation, compilation and linking both for the individual matrix elements (unless this has to be done manually) and for the common external driver code which interfaces those matrix element.
3. The `generate_driver_code` writes the common driver as source code to file.
4. The methods `make_source`, `make_compile`, and `make_link` individually perform the corresponding steps in building the library. Wherever possible, they simply use the generated makefile. By calling `make`, we make sure that we can avoid unnecessary recompilation. For the compilation and linking steps, the makefile will employ `libtool`.
5. The `load` method loads the library procedures into the corresponding procedure pointers, using the `dlopen` mechanism via the `dlaccess` subobject.

### 13.2.3 The module

```
<prclib_interfaces.f90>≡
  <File header>
```

```
module prclib_interfaces
```

```

use, intrinsic :: iso_c_binding !NODEP!

use kinds
⟨Use strings⟩
use io_units
use system_defs, only: TAB
use string_utils, only: lower_case
use diagnostics
use os_interface

⟨Standard module head⟩

⟨Prclib interfaces: public⟩

⟨Prclib interfaces: types⟩

⟨Prclib interfaces: interfaces⟩

contains

⟨Prclib interfaces: procedures⟩

end module prclib_interfaces

```

### 13.2.4 Writers

External matrix element code provides externally visible procedures, which we denote as *features*. The features consist of informational subroutines and functions which are mandatory (universal features) and matrix-element specific subroutines and functions (specific features). The driver interfaces the generic features directly, while it returns the specific features in form of bind(C) procedure pointers to the caller. For instance, function `n_in` is generic, while the matrix matrix-element value itself is specific.

To implement these tasks, the driver needs `use` directives for Fortran module procedures, interface blocks for other external stuff, wrapper code, and Makefile snippets.

#### Generic writer

In the `prc_writer_t` data type, we collect the procedures which implement the writing tasks. The type is abstract. The concrete implementations are defined by an extension which is specific for the process type.

The MD5 sum stored here should be the MD5 checksum of the current process component, which can be calculated once the process is configured completely. It can be used by implementations which work with external files, such as O'MEGA.

```

⟨Prclib interfaces: public⟩≡
public :: prc_writer_t

⟨Prclib interfaces: types⟩≡
type, abstract :: prc_writer_t

```

```

character(32) :: md5sum = ""
contains
⟨Prclib interfaces: prc writer: TBP⟩
end type prc_writer_t

```

In any case, it is useful to have a string representation of the writer type. This must be implemented by all extensions.

```

⟨Prclib interfaces: prc writer: TBP⟩≡
procedure(get_const_string), nopass, deferred :: type_name
⟨Prclib interfaces: interfaces⟩≡
abstract interface
    function get_const_string () result (string)
        import
        type(string_t) :: string
    end function get_const_string
end interface

```

Return the name of a procedure that implements a given feature, as it is provided by the external matrix-element code. For a reasonable default, we take the feature name unchanged.

```

⟨Prclib interfaces: prc writer: TBP⟩+≡
procedure, nopass :: get_procname => prc_writer_get_procname
⟨Prclib interfaces: procedures⟩≡
function prc_writer_get_procname (feature) result (name)
    type(string_t) :: name
    type(string_t), intent(in) :: feature
    name = feature
end function prc_writer_get_procname

```

Return the name of a procedure that implements a given feature with the bind(C) property, so it can be accessed via a C procedure pointer and handled by dlopen. We need this for all special features of a matrix element, since the interface has to return a C function pointer for it. For a default implementation, we prefix the external procedure name by the process ID.

```

⟨Prclib interfaces: prc writer: TBP⟩+≡
procedure :: get_c_procname => prc_writer_get_c_procname
⟨Prclib interfaces: procedures⟩+≡
function prc_writer_get_c_procname (writer, id, feature) result (name)
    class(prc_writer_t), intent(in) :: writer
    type(string_t), intent(in) :: id, feature
    type(string_t) :: name
    name = id // "_" // feature
end function prc_writer_get_c_procname

```

Common signature of code-writing procedures. The procedure may use the process ID, and the feature name. (Not necessarily all of them.)

```

⟨Prclib interfaces: interfaces⟩+≡
abstract interface
    subroutine write_code_file (writer, id)

```

```

import
class(prc_writer_t), intent(in) :: writer
type(string_t), intent(in) :: id
end subroutine write_code_file
end interface

abstract interface
    subroutine write_code (writer, unit, id)
        import
        class(prc_writer_t), intent(in) :: writer
        integer, intent(in) :: unit
        type(string_t), intent(in) :: id
    end subroutine write_code
end interface

abstract interface
    subroutine write_code_os (writer, unit, id, os_data, testflag)
        import
        class(prc_writer_t), intent(in) :: writer
        integer, intent(in) :: unit
        type(string_t), intent(in) :: id
        type(os_data_t), intent(in) :: os_data
        logical, intent(in), optional :: testflag
    end subroutine write_code_os
end interface

abstract interface
    subroutine write_feature_code (writer, unit, id, feature)
        import
        class(prc_writer_t), intent(in) :: writer
        integer, intent(in) :: unit
        type(string_t), intent(in) :: id, feature
    end subroutine write_feature_code
end interface

```

There must be a procedure which writes an interface block for a given feature. If the external matrix element is implemented as a Fortran module, this is required only for the specific features which are returned as procedure pointers.

*(Prelib interfaces: prc writer: TBP)*+≡  
procedure(write\_feature\_code), deferred :: write\_interface

There must also be a procedure which writes Makefile code which is specific for the current process, but not the feature.

*(Prelib interfaces: prc writer: TBP)*+≡  
procedure(write\_code\_os), deferred :: write\_makefile\_code

This procedure writes code process-specific source-code file (which need not be Fortran). It may be a no-op, if the source code is generated by Make instead.

*(Prelib interfaces: prc writer: TBP)*+≡  
procedure(write\_code\_file), deferred :: write\_source\_code

## Writer for Fortran-module matrix elements

If the matrix element is available as a Fortran module, we have specific requirements: (i) the features are imported via `use` directives, (ii) the specific features require `bind(C)` wrappers.

The type is still abstract, all methods must be implemented explicitly for a specific matrix-element variant.

```
(Prelib interfaces: public)+≡
    public :: prc_writer_f_module_t
(Prelib interfaces: types)+≡
    type, extends (prc_writer_t), abstract :: prc_writer_f_module_t
    contains
        (Prelib interfaces: prc writer f module: TBP)
    end type prc_writer_f_module_t
```

Return the name of the Fortran module. As a default implementation, we take the process ID unchanged.

```
(Prelib interfaces: prc writer f module: TBP)≡
    procedure, nopass :: get_module_name => prc_writer_get_module_name
(Prelib interfaces: procedures)+≡
    function prc_writer_get_module_name (id) result (name)
        type(string_t) :: name
        type(string_t), intent(in) :: id
        name = id
    end function prc_writer_get_module_name
```

Write a `use` directive that associates the driver reference with the procedure in the matrix element code. By default, we use the C name for this.

```
(Prelib interfaces: prc writer f module: TBP)+≡
    procedure :: write_use_line => prc_writer_write_use_line
(Prelib interfaces: procedures)+≡
    subroutine prc_writer_write_use_line (writer, unit, id, feature)
        class(prc_writer_f_module_t), intent(in) :: writer
        integer, intent(in) :: unit
        type(string_t) :: id, feature
        write (unit, "(2x,9A)") "use ", char (writer%get_module_name (id)), &
            ", only: ", char (writer%get_c_procname (id, feature)), &
            " => ", char (writer%get_procname (feature))
    end subroutine prc_writer_write_use_line
```

Write a wrapper routine for a feature. This also associates a C name the module procedure. The details depend on the writer variant.

```
(Prelib interfaces: prc writer f module: TBP)+≡
    procedure(prc_write_wrapper), deferred :: write_wrapper
(Prelib interfaces: interfaces)+≡
    abstract interface
        subroutine prc_write_wrapper (writer, unit, id, feature)
            import
            class(prc_writer_f_module_t), intent(in) :: writer
            integer, intent(in) :: unit
```

```

    type(string_t), intent(in) :: id, feature
  end subroutine prc_write_wrapper
end interface

```

This is used for testing only: initialize the writer with a specific MD5 sum string.

```

⟨Prclib interfaces: prc writer: TBP⟩+≡
  procedure :: init_test => prc_writer_init_test
⟨Prclib interfaces: procedures⟩+≡
  subroutine prc_writer_init_test (writer)
    class(prc_writer_t), intent(out) :: writer
    writer%md5sum = "1234567890abcdef1234567890abcdef"
  end subroutine prc_writer_init_test

```

### Writer for C-library matrix elements

This applies if the matrix element is available as a C library or a Fortran library with bind(C) compatible interface. We can use the basic version.

The type is still abstract, all methods must be implemented explicitly for a specific matrix-element variant.

```

⟨Prclib interfaces: public⟩+≡
  public :: prc_writer_c_lib_t
⟨Prclib interfaces: types⟩+≡
  type, extends (prc_writer_t), abstract :: prc_writer_c_lib_t
  contains
    ⟨Prclib interfaces: prc writer c lib: TBP⟩
  end type prc_writer_c_lib_t

```

### 13.2.5 Process records in the library driver

A process record holds the process (component) ID, the physics `model_name`, and the array of `features` that are implemented by the corresponding matrix element code.

The `writer` component holds procedures. The procedures write source code for the current record, either for the driver or for the Makefile.

```

⟨Prclib interfaces: types⟩+≡
  type :: prclib_driver_record_t
    type(string_t) :: id
    type(string_t) :: model_name
    type(string_t), dimension(:), allocatable :: feature
    class(prc_writer_t), pointer :: writer => null ()
    contains
      ⟨Prclib interfaces: prclib driver record: TBP⟩
  end type prclib_driver_record_t

```

Output routine. We indent the output, so it smoothly integrates into the output routine for the whole driver.

Note: the pointer `writer` is introduced as a workaround for a NAG compiler bug.

```
(Prclib interfaces: prclib driver record: TBP)≡
procedure :: write => prclib_driver_record_write
(Prclib interfaces: procedures)+≡
subroutine prclib_driver_record_write (object, unit)
  class(prclib_driver_record_t), intent(in) :: object
  integer, intent(in) :: unit
  integer :: j
  class(prc_writer_t), pointer :: writer
  write (unit, "(3x,A,2x,['A',''])" ) &
    char (object%id), char (object%model_name)
  if (allocated (object%feature)) then
    writer => object%writer
    write (unit, "(5x,A,A)", advance="no") &
      char (writer%type_name()), ":" 
    do j = 1, size (object%feature)
      write (unit, "(1x,A)", advance="no") &
        char (object%feature(j))
    end do
    write (unit, *)
  end if
end subroutine prclib_driver_record_write
```

Get the C procedure name for a feature.

```
(Prclib interfaces: prclib driver record: TBP)+≡
procedure :: get_c_procname => prclib_driver_record_get_c_procname
(Prclib interfaces: procedures)+≡
function prclib_driver_record_get_c_procname (record, feature) result (name)
  type(string_t) :: name
  class(prclib_driver_record_t), intent(in) :: record
  type(string_t), intent(in) :: feature
  name = record%writer%get_c_procname (record%id, feature)
end function prclib_driver_record_get_c_procname
```

Write a USE directive for a given feature. Applies only if the record corresponds to a Fortran module.

```
(Prclib interfaces: prclib driver record: TBP)+≡
procedure :: write_use_line => prclib_driver_record_write_use_line
(Prclib interfaces: procedures)+≡
subroutine prclib_driver_record_write_use_line (record, unit, feature)
  class(prclib_driver_record_t), intent(in) :: record
  integer, intent(in) :: unit
  type(string_t), intent(in) :: feature
  select type (writer => record%writer)
  class is (prc_writer_f_module_t)
    call writer%write_use_line (unit, record%id, feature)
  end select
end subroutine prclib_driver_record_write_use_line
```

The alternative: write an interface block for a given feature, unless the record corresponds to a Fortran module.

```
(Prelib interfaces: prclib driver record: TBP)+≡
    procedure :: write_interface => prclib_driver_record_write_interface

(Prelib interfaces: procedures)+≡
    subroutine prclib_driver_record_write_interface (record, unit, feature)
        class(prclib_driver_record_t), intent(in) :: record
        integer, intent(in) :: unit
        type(string_t), intent(in) :: feature
        select type (writer => record%writer)
        class is (prc_writer_f_module_t)
        class default
            call writer%write_interface (unit, record%id, feature)
        end select
    end subroutine prclib_driver_record_write_interface
```

Write all special feature interfaces for the current record. Do this for all process variants.

```
(Prelib interfaces: prclib driver record: TBP)+≡
    procedure :: write_interfaces => prclib_driver_record_write_interfaces

(Prelib interfaces: procedures)+≡
    subroutine prclib_driver_record_write_interfaces (record, unit)
        class(prclib_driver_record_t), intent(in) :: record
        integer, intent(in) :: unit
        integer :: i
        do i = 1, size (record%feature)
            call record%writer%write_interface (unit, record%id, record%feature(i))
        end do
    end subroutine prclib_driver_record_write_interfaces
```

Write the wrapper routines for this record, if it corresponds to a Fortran module.

```
(Prelib interfaces: prclib driver record: TBP)+≡
    procedure :: write_wrappers => prclib_driver_record_write_wrappers

(Prelib interfaces: procedures)+≡
    subroutine prclib_driver_record_write_wrappers (record, unit)
        class(prclib_driver_record_t), intent(in) :: record
        integer, intent(in) :: unit
        integer :: i
        select type (writer => record%writer)
        class is (prc_writer_f_module_t)
            do i = 1, size (record%feature)
                call writer%write_wrapper (unit, record%id, record%feature(i))
            end do
        end select
    end subroutine prclib_driver_record_write_wrappers
```

Write the Makefile code for this record.

```
(Prelib interfaces: prclib driver record: TBP)+≡
    procedure :: write_makefile_code => prclib_driver_record_write_makefile_code
```

```

⟨Prclib interfaces: procedures⟩+≡
    subroutine prclib_driver_record_write_makefile_code &
        (record, unit, os_data, testflag)
        class(prclib_driver_record_t), intent(in) :: record
        integer, intent(in) :: unit
        type(os_data_t), intent(in) :: os_data
        logical, intent(in), optional :: testflag
        call record%writer%write_makefile_code (unit, record%id, os_data, testflag)
    end subroutine prclib_driver_record_write_makefile_code

```

Write source-code files for this record. (Does nothing if the source code is handled by Makefile rules.)

```

⟨Prclib interfaces: prclib driver record: TBP⟩+≡
    procedure :: write_source_code => prclib_driver_record_write_source_code
⟨Prclib interfaces: procedures⟩+≡
    subroutine prclib_driver_record_write_source_code (record)
        class(prclib_driver_record_t), intent(in) :: record
        call record%writer%write_source_code (record%id)
    end subroutine prclib_driver_record_write_source_code

```

### 13.2.6 The process library driver object

A `prclib_driver_t` object provides the interface to external matrix element code. The code is provided by an external library which is either statically or dynamically linked.

The dynamic and static versions of the library are two different implementations of the abstract base type.

The `basename` identifies the library, both by file names and by Fortran variable names.

The `loaded` flag becomes true once all procedure pointers to the matrix element have been assigned.

For a dynamical external library, the communication proceeds via a `dlaccess` object.

`n_processes` is the number of external process code components that are referenced by this library. The code is addressed by index (`i_lib` in the process library entry above). This number should be equal to the number returned by `get_n_prc`.

For each external process, there is a separate `record` which holds the data that are needed for the driver parts which are specific for a given process component. The actual pointers for the loaded library will be assigned elsewhere.

The remainder is a collection of procedure pointers, which can be assigned once all external code has been compiled and linked. The procedure pointers all take a process component code index as an argument. Most return information about the process component that should match the process definition. The `get_fptr` procedures return a function pointer, which is the actual means to compute matrix elements or retrieve associated data.

Finally, the `unload_hook` and `reload_hook` pointers allow for the insertion of additional code when a library is loaded.

```

⟨Prclib interfaces: public⟩+≡

```

```

public :: prclib_driver_t
⟨Prclib interfaces: types⟩+≡

contains
  ⟨Prclib interfaces: prclib driver: TBP⟩
end type prclib_driver_t

```

This is the dynamic version. It contains a `dlaccess` object for communicating with the OS.

```

⟨Prclib interfaces: types⟩+≡
  type, extends (prclib_driver_t) :: prclib_driver_dynamic_t
    type(dlaccess_t) :: dlaccess
  contains
  ⟨Prclib interfaces: prclib driver dynamic: TBP⟩
end type prclib_driver_dynamic_t

```

Print just the metadata. Procedure pointers cannot be printed.

```

⟨Prclib interfaces: prclib driver: TBP⟩≡
  procedure :: write => prclib_driver_write

```

```

⟨Prelib interfaces: procedures⟩+≡
subroutine prclib_driver_write (object, unit, libpath)
  class(prclib_driver_t), intent(in) :: object
  integer, intent(in) :: unit
  logical, intent(in), optional :: libpath
  logical :: write_lib
  integer :: i
  write_lib = .true.
  if (present (libpath)) write_lib = libpath
  write (unit, "(1x,A,A)") &
    "External matrix-element code library: ", char (object%basename)
  select type (object)
  type is (prclib_driver_dynamic_t)
    write (unit, "(3x,A,L1)") "static      = F"
  class default
    write (unit, "(3x,A,L1)") "static      = T"
  end select
  write (unit, "(3x,A,L1)") "loaded      = ", object%loaded
  write (unit, "(3x,A,A,A)") "MD5 sum     = '", object%md5sum, "'"
  if (write_lib) then
    write (unit, "(3x,A,A,A)") "Mdl flags = '", &
      char (object%modellibs_ldflags), "'"
  end if
  select type (object)
  type is (prclib_driver_dynamic_t)
    write (unit, *)
    call object%dlaccess%write (unit)
  end select
  write (unit, *)
  if (allocated (object%record)) then
    write (unit, "(1x,A)") "Matrix-element code entries:"
    do i = 1, object%n_processes
      call object%record(i)%write (unit)
    end do
  else
    write (unit, "(1x,A)") "Matrix-element code entries: [undefined]"
  end if
end subroutine prclib_driver_write

```

Allocate a library as either static or dynamic. For static libraries, the procedure defers control to an external procedure which knows about the available static libraries. By default, this procedure is empty, but when we build a stand-alone executable, we replace the dummy by an actual dispatcher for the available static libraries. If the static dispatcher was not successful, we allocate a dynamic library.

The default version of `dispatch_prclib_static` resides in the `prebuilt` section of the `WHIZARD` tree, in a separate library. It does nothing, but can be replaced by a different procedure that allocates a static library driver if requested by name.

Note: `intent(out)` for the `driver` argument segfaults with gfortran 4.7.

```

⟨Prelib interfaces: public⟩+≡
public :: dispatch_prclib_driver

```

```

⟨Prclib interfaces: procedures⟩+≡
    subroutine dispatch_prclib_driver &
        (driver, basename, modellibs_ldflags)
        class(prclib_driver_t), intent(inout), allocatable :: driver
        type(string_t), intent(in) :: basename
        type(string_t), intent(in), optional :: modellibs_ldflags
        procedure(dispatch_prclib_driver) :: dispatch_prclib_static
        if (allocated (driver)) deallocate (driver)
        call dispatch_prclib_static (driver, basename)
        if (.not. allocated (driver)) then
            allocate (prclib_driver_dynamic_t :: driver)
        end if
        driver%basename = basename
        driver%modellibs_ldflags = modellibs_ldflags
    end subroutine dispatch_prclib_driver

```

Initialize the ID array and set `n_processes` accordingly.

```

⟨Prclib interfaces: prclib driver: TBP⟩+≡

call driver%write_get_md5sum_fun (unit, prefix)
call driver%write_string_to_array_fun (unit, prefix)
call driver%write_get_openmp_status_fun (unit, prefix)
call driver%write_get_int_fun (unit, prefix, var_str ("n_in"))
call driver%write_get_int_fun (unit, prefix, var_str ("n_out"))
call driver%write_get_int_fun (unit, prefix, var_str ("n_flv"))
call driver%write_get_int_fun (unit, prefix, var_str ("n_hel"))
call driver%write_get_int_fun (unit, prefix, var_str ("n_col"))
call driver%write_get_int_fun (unit, prefix, var_str ("n_cin"))
call driver%write_get_int_fun (unit, prefix, var_str ("n_cf"))
call driver%write_set_int_sub (unit, prefix, var_str ("flv_state"))
call driver%write_set_int_sub (unit, prefix, var_str ("hel_state"))
call driver%write_set_col_state_sub (unit, prefix)
call driver%write_set_color_factors_sub (unit, prefix)
call driver%write_get_fptr_sub (unit, prefix)
do i = 1, driver%n_processes
    call driver%record(i)%write_wrappers (unit)
end do
end subroutine prclib_driver_generate_code

```

The driver module is used and required *only* if we intend to link the library statically. Then, it provides the (static) driver type as a concrete implementation of the abstract library driver. This type contains the internal dispatcher for assigning the library procedures to their appropriate procedure pointers. In the dynamical case, the assignment is done via the base-type dispatcher which invokes the DL mechanism.

However, compiling this together with the rest in any case should not do any harm.

```

⟨Prclib interfaces: prclib driver: TBP⟩+≡
procedure, nopass :: write_module => prclib_driver_write_module

### 13.2.9 Interface bodies for informational functions

These interfaces implement the communication between WHIZARD (the main program) and the process-library driver. The procedures are all BIND(C), so they can safely be exposed by the library and handled by the `dlopen` mechanism, which apparently understands only C calling conventions.

In the sections below, for each procedure, we provide both the interface itself and a procedure that writes the correponding procedure as source code to the process library driver.

#### Process count

Return the number of processes contained in the library.

```

⟨Prclib interfaces: public⟩+≡
  public :: prc_get_n_processes

⟨Prclib interfaces: interfaces⟩+≡
  abstract interface
    function prc_get_n_processes () result (n) bind(C)
      import
      integer(c_int) :: n
    end function prc_get_n_processes
  end interface

```

Here is the code.

```

⟨Prclib interfaces: prclib driver: TBP⟩+≡
  procedure :: write_get_n_processes_fun

⟨Prclib interfaces: procedures⟩+≡
  subroutine write_get_n_processes_fun (driver, unit, prefix)
    class(prclib_driver_t), intent(in) :: driver
    integer, intent(in) :: unit
    type(string_t), intent(in) :: prefix
    write (unit, "(A)") ""
    write (unit, "(A)") "! Return the number of processes in this library"
    write (unit, "(A)") "function " // char (prefix) &
      // "get_n_processes () result (n) bind(C)"
    write (unit, "(A)") "  use iso_c_binding"
    write (unit, "(A)") "  implicit none"
    write (unit, "(A)") "  integer(c_int) :: n"
    write (unit, "(A,IO)") "  n = ", driver%n_processes
    write (unit, "(A)") "end function " // char (prefix) &
      // "get_n_processes"
  end subroutine write_get_n_processes_fun

```

#### Informational string functions

These functions return constant information about the matrix-element code.

The following procedures have to return strings. With the BIND(C) constraint, we choose to return the C pointer to a string, and its length, so the procedures implement this interface. They are actually subroutines.

```
(Prclib interfaces: public)+≡
  public :: prc_get_stringptr
(Prclib interfaces: interfaces)+≡
  abstract interface
    subroutine prc_get_stringptr (i, cptr, len) bind(C)
      import
      integer(c_int), intent(in) :: i
      type(c_ptr), intent(out) :: cptr
      integer(c_int), intent(out) :: len
    end subroutine prc_get_stringptr
  end interface
```

To hide this complication, we introduce a subroutine that converts the returned C pointer to a `string_t` object. As a side effect, we deallocate the original after conversion – otherwise, we might have a memory leak.

For the conversion, we first pointer-convert the C pointer to a Fortran character array pointer, length 1 and size `len`. Using argument association and an internal subroutine, we convert this to a character array with length `len` and size 1. Using ordinary assignment, we finally convert this to `string_t`.

The function takes the pointer-returning function as an argument. The index `i` identifies the process in the library.

```
(Prclib interfaces: procedures)+≡
  subroutine get_string_via_cptr (string, i, get_stringptr)
    type(string_t), intent(out) :: string
    integer, intent(in) :: i
    procedure(prc_get_stringptr) :: get_stringptr
    type(c_ptr) :: cptr
    integer(c_int) :: pid, len
    character(kind=c_char), dimension(:), pointer :: c_array
    pid = i
    call get_stringptr (pid, cptr, len)
    if (c_associated (cptr)) then
      call c_f_pointer (cptr, c_array, shape = [len])
      call set_string (c_array)
      call get_stringptr (0_c_int, cptr, len)
    else
      string = ""
    end if
    contains
    subroutine set_string (buffer)
      character(len, kind=c_char), dimension(1), intent(in) :: buffer
      string = buffer(1)
    end subroutine set_string
  end subroutine get_string_via_cptr
```

Since the module procedures return Fortran strings, we have to convert them. This is the necessary auxiliary routine. The routine is not BIND(C), it is not accessed from outside.

```
(Prclib interfaces: prclib driver: TBP)+≡
```

```

procedure, nopass :: write_string_to_array_fun
⟨Prclib interfaces: procedures⟩+≡
    subroutine write_string_to_array_fun (unit, prefix)
        integer, intent(in) :: unit
        type(string_t), intent(in) :: prefix
        write (unit, "(A)") ""
        write (unit, "(A)") "! Auxiliary: convert character string &
                           &to array pointer"
        write (unit, "(A)") "subroutine " // char (prefix) &
                           // "string_to_array (string, a)"
        write (unit, "(A)") " use iso_c_binding"
        write (unit, "(A)") " implicit none"
        write (unit, "(A)") " character(*), intent(in) :: string"
        write (unit, "(A)") " character(kind=c_char), dimension(:), &
                           &allocatable, intent(out) :: a"
        write (unit, "(A)") " integer :: i"
        write (unit, "(A)") " allocate (a (len (string)))"
        write (unit, "(A)") " do i = 1, size (a)"
        write (unit, "(A)") "     a(i) = string(i:i)"
        write (unit, "(A)") " end do"
        write (unit, "(A)") "end subroutine " // char (prefix) &
                           // "string_to_array"
    end subroutine write_string_to_array_fun

```

The above routine is called by other functions. It is not in a module, so they need its interface explicitly.

```

⟨Prclib interfaces: procedures⟩+≡
    subroutine write_string_to_array_interface (unit, prefix)
        integer, intent(in) :: unit
        type(string_t), intent(in) :: prefix
        write (unit, "(2x,A)") "interface"
        write (unit, "(2x,A)") " subroutine " // char (prefix) &
                           // "string_to_array (string, a)"
        write (unit, "(2x,A)") " use iso_c_binding"
        write (unit, "(2x,A)") " implicit none"
        write (unit, "(2x,A)") " character(*), intent(in) :: string"
        write (unit, "(2x,A)") " character(kind=c_char), dimension(:), &
                           &allocatable, intent(out) :: a"
        write (unit, "(2x,A)") "end subroutine " // char (prefix) &
                           // "string_to_array"
        write (unit, "(2x,A)") "end interface"
    end subroutine write_string_to_array_interface

```

Here are the info functions which return strings, implementing the interface prc\_get\_stringptr.

Return the process ID for each process.

```

⟨Prclib interfaces: prclib driver: TBP⟩+≡
    procedure :: write_get_process_id_fun
⟨Prclib interfaces: procedures⟩+≡
    subroutine write_get_process_id_fun (driver, unit, prefix)
        class(prclib_driver_t), intent(in) :: driver
        integer, intent(in) :: unit

```

```

type(string_t), intent(in) :: prefix
integer :: i
write (unit, "(A)") ""
write (unit, "(A)") "! Return the process ID of process #i &
    &(as a C pointer to a character array)"
write (unit, "(A)") "subroutine " // char (prefix) &
    // "get_process_id_ptr (i, cptr, len) bind(C)"
write (unit, "(A)") "    use iso_c_binding"
write (unit, "(A)") "    implicit none"
write (unit, "(A)") "    integer(c_int), intent(in) :: i"
write (unit, "(A)") "    type(c_ptr), intent(out) :: cptr"
write (unit, "(A)") "    integer(c_int), intent(out) :: len"
write (unit, "(A)") "    character(kind=c_char), dimension(:), &
        &allocatable, target, save :: a"

write (unit, "(A)")  "  else"
write (unit, "(A)")  "      cptr = c_null_ptr"
write (unit, "(A)")  "      len = 0"
write (unit, "(A)")  "  end if"
write (unit, "(A)")  "end subroutine" // char (prefix) &
// "get_model_name_ptr"
end subroutine write_get_model_name_fun

```

Call the MD5 sum function for the process. The function calls the corresponding function of the matrix-element code, and it returns the C address of a character array with length 32.

```

⟨Prclib interfaces: prclib driver: TBP⟩+≡
procedure :: write_get_md5sum_fun

⟨Prclib interfaces: procedures⟩+≡
subroutine write_get_md5sum_fun (driver, unit, prefix)
    class(prclib_driver_t), intent(in) :: driver
    integer, intent(in) :: unit
    type(string_t), intent(in) :: prefix
    integer :: i
    write (unit, "(A)")  ""
    write (unit, "(A)")  "! Return the MD5 sum for the process configuration &
        &(as a C pointer to a character array)"
    write (unit, "(A)")  "subroutine" // char (prefix) &
        // "get_md5sum_ptr (i, cptr, len) bind(C)"
    write (unit, "(A)")  "  use iso_c_binding"
    call driver%write_interfaces (unit, var_str ("md5sum"))
    write (unit, "(A)")  "  interface"
    write (unit, "(A)")  "      function" // char (prefix) &
        // "md5sum () result (md5sum)"
    write (unit, "(A)")  "          character(32) :: md5sum"
    write (unit, "(A)")  "      end function" // char (prefix) // "md5sum"
    write (unit, "(A)")  "  end interface"
    write (unit, "(A)")  "  integer(c_int), intent(in) :: i"
    write (unit, "(A)")  "  type(c_ptr), intent(out) :: cptr"
    write (unit, "(A)")  "  integer(c_int), intent(out) :: len"
    write (unit, "(A)")  "  character(kind=c_char), dimension(32), &
        &target, save :: md5sum"
    write (unit, "(A)")  "  select case (i)"

```

```

write (unit, "(A)")  "  case (0)"
write (unit, "(A)")  "      call copy (" // char (prefix) // "md5sum ()"
write (unit, "(A)")  "      cptr = c_loc (md5sum)"
do i = 1, driver%n_processes
    write (unit, "(A,I0,A)")  "  case (", i, ")"
    call driver%record(i)%write_md5sum_call (unit)
end do
write (unit, "(A)")  "  case default"
write (unit, "(A)")  "      cptr = c_null_ptr"
write (unit, "(A)")  "  end select"
write (unit, "(A)")  "  len = 32"
write (unit, "(A)")  "contains"
write (unit, "(A)")  " subroutine copy (md5sum_tmp)"
write (unit, "(A)")  "      character, dimension(32), intent(in) :: &
&md5sum_tmp"
write (unit, "(A)")  "      md5sum = md5sum_tmp"
write (unit, "(A)")  "  end subroutine copy"
write (unit, "(A)")  "end subroutine " // char (prefix) &
// "get_md5sum_ptr"
end subroutine write_get_md5sum_fun

```

The actual call depends on the type of matrix element.

*(Prclib interfaces: prclib driver record: TBP)*+≡  
procedure :: write\_md5sum\_call => prclib\_driver\_record\_write\_md5sum\_call  
*(Prclib interfaces: procedures)*+≡  
subroutine prclib\_driver\_record\_write\_md5sum\_call (record, unit)  
class(prclib\_driver\_record\_t), intent(in) :: record  
integer, intent(in) :: unit  
call record%writer%write\_md5sum\_call (unit, record%id)  
end subroutine prclib\_driver\_record\_write\_md5sum\_call

The interface goes into the writer base type:

*(Prclib interfaces: prc writer: TBP)*+≡  
procedure(write\_code), deferred :: write\_md5sum\_call  
In the Fortran module case, we take a detour. The string returned by the Fortran function is copied into a fixed-size array. The copy routine is an internal subroutine of get\_md5sum\_ptr. We return the C address of the target array.  
*(Prclib interfaces: prc writer f module: TBP)*+≡  
procedure :: write\_md5sum\_call => prc\_writer\_f\_module\_write\_md5sum\_call  
*(Prclib interfaces: procedures)*+≡  
subroutine prc\_writer\_f\_module\_write\_md5sum\_call (writer, unit, id)  
class(prc\_writer\_f\_module\_t), intent(in) :: writer  
integer, intent(in) :: unit  
type(string\_t), intent(in) :: id  
write (unit, "(5x,9A)") "call copy (", &
char (writer%get\_c\_procname (id, var\_str ("md5sum"))), " ())"
write (unit, "(5x,9A)") "cptr = c\_loc (md5sum)"
end subroutine prc\_writer\_f\_module\_write\_md5sum\_call

In the C library case, the library function returns a C pointer, which we can just copy.

```
<Prclib interfaces: prc writer c lib: TBP>≡
procedure :: write_md5sum_call => prc_writer_c_lib_write_md5sum_call
<Prclib interfaces: procedures>+≡
subroutine prc_writer_c_lib_write_md5sum_call (writer, unit, id)
  class(prc_writer_c_lib_t), intent(in) :: writer
  integer, intent(in) :: unit
  type(string_t), intent(in) :: id
  write (unit, "(5x,9A)") &
    "cptr = ", &
    char (writer%get_c_procname (id, var_str ("get_md5sum"))), " ()"
end subroutine prc_writer_c_lib_write_md5sum_call
```

### Actual references to the info functions

The string-valued info functions return C character arrays. For the API of the library driver, we provide convenience functions which (re)convert those arrays into `string_t` objects.

```
<Prclib interfaces: prclib driver: TBP>+≡
procedure :: get_process_id => prclib_driver_get_process_id
procedure :: get_model_name => prclib_driver_get_model_name
procedure :: get_md5sum => prclib_driver_get_md5sum
<Prclib interfaces: procedures>+≡
function prclib_driver_get_process_id (driver, i) result (string)
  type(string_t) :: string
  class(prclib_driver_t), intent(in) :: driver
  integer, intent(in) :: i
  call get_string_via_cptr (string, i, driver%get_process_id_ptr)
end function prclib_driver_get_process_id

function prclib_driver_get_model_name (driver, i) result (string)
  type(string_t) :: string
  class(prclib_driver_t), intent(in) :: driver
  integer, intent(in) :: i
  call get_string_via_cptr (string, i, driver%get_model_name_ptr)
end function prclib_driver_get_model_name

function prclib_driver_get_md5sum (driver, i) result (string)
  type(string_t) :: string
  class(prclib_driver_t), intent(in) :: driver
  integer, intent(in) :: i
  call get_string_via_cptr (string, i, driver%get_md5sum_ptr)
end function prclib_driver_get_md5sum
```

### Informational logical functions

When returning a logical value, we use the C boolean type, which may differ from Fortran.

```
<Prclib interfaces: public>+≡
```

```

public :: prc_get_log
⟨Prclib interfaces: interfaces⟩+≡
    abstract interface
        function prc_get_log (pid) result (l) bind(C)
            import
            integer(c_int), intent(in) :: pid
            logical(c_bool) :: l
        end function prc_get_log
    end interface

Return a logical flag which tells whether OpenMP is supported for a specific
process code.

⟨Prclib interfaces: prclib driver: TBP⟩+≡
    procedure :: write_get_openmp_status_fun

⟨Prclib interfaces: procedures⟩+≡
    subroutine write_get_openmp_status_fun (driver, unit, prefix)
        class(prclib_driver_t), intent(in) :: driver
        integer, intent(in) :: unit
        type(string_t), intent(in) :: prefix
        integer :: i
        write (unit, "(A)") ""
        write (unit, "(A)") "! Return the OpenMP support status"
        write (unit, "(A)") "function " // char (prefix) &
        // "get_openmp_status (i) result (openmp_status) bind(C)"
        write (unit, "(A)") " use iso_c_binding"
        call driver%write_interfaces (unit, var_str ("openmp_supported"))
        write (unit, "(A)") " integer(c_int), intent(in) :: i"
        write (unit, "(A)") " logical(c_bool) :: openmp_status"
        write (unit, "(A)") " select case (i)"
        do i = 1, driver%n_processes
            write (unit, "(A,I0,9A)") " case (", i, "); ", &
                "openmp_status = ", &
                char (driver%record(i)%get_c_procname &
                (var_str ("openmp_supported"))), " ()"
        end do
        write (unit, "(A)") " end select"
        write (unit, "(A)") "end function " // char (prefix) &
        // "get_openmp_status"
    end subroutine write_get_openmp_status_fun

```

### Informational integer functions

Various process metadata are integer values. We can use a single interface for all of them.

```

⟨Prclib interfaces: public⟩+≡
    public :: prc_get_int

⟨Prclib interfaces: interfaces⟩+≡
    abstract interface
        function prc_get_int (pid) result (n) bind(C)
            import
            integer(c_int), intent(in) :: pid

```

```

        integer(c_int) :: n
    end function prc_get_int
end interface

This function returns any data of type integer, for each process.

⟨Prclib interfaces: prclib driver: TBP⟩+≡
procedure :: write_get_int_fun
⟨Prclib interfaces: procedures⟩+≡
subroutine write_get_int_fun (driver, unit, prefix, feature)
    class(prclib_driver_t), intent(in) :: driver
    integer, intent(in) :: unit
    type(string_t), intent(in) :: prefix
    type(string_t), intent(in) :: feature
    integer :: i
    write (unit, "(A)") ""
    write (unit, "(9A)") "! Return the value of ", char (feature)
    write (unit, "(9A)") "function ", char (prefix), &
        & "get_", char (feature), " (pid)", &
        & " result (", char (feature), ") bind(C)"
    write (unit, "(9A)") " use iso_c_binding"
    call driver%write_interfaces (unit, feature)
    write (unit, "(9A)") " integer(c_int), intent(in) :: pid"
    write (unit, "(9A)") " integer(c_int) :: ", char (feature)
    write (unit, "(9A)") " select case (pid)"
    do i = 1, driver%n_processes
        write (unit, "(2x,A,I0,9A)") "case (", i, ");  ", &
            char (feature), " = ", &
            char (driver%record(i)%get_c_procname (feature)), &
            " ()"
    end do
    write (unit, "(9A)") " end select"
    write (unit, "(9A)") "end function ", char (prefix), &
        & "get_", char (feature)
end subroutine write_get_int_fun

```

Write a `case` line that assigns the value of the external function to the current return value.

```

⟨Prclib interfaces: procedures⟩+≡
subroutine write_case_int_fun (record, unit, i, feature)
    class(prclib_driver_record_t), intent(in) :: record
    integer, intent(in) :: unit
    integer, intent(in) :: i
    type(string_t), intent(in) :: feature
    write (unit, "(5x,A,I0,9A)") "case (", i, ");  ", &
        & char (feature), " = ", char (record%get_c_procname (feature))
end subroutine write_case_int_fun

```

### Flavor and helicity tables

Transferring tables is more complicated. First, a two-dimensional array.

```

⟨Prclib interfaces: public⟩+≡
public :: prc_set_int_tab1

```

```

⟨Prclib interfaces: interfaces⟩+≡
    abstract interface
        subroutine prc_set_int_tab1 (pid, tab, shape) bind(C)
            import
            integer(c_int), intent(in) :: pid
            integer(c_int), dimension(*), intent(out) :: tab
            integer(c_int), dimension(2), intent(in) :: shape
        end subroutine prc_set_int_tab1
    end interface

This subroutine returns a table of integers.

⟨Prclib interfaces: prclib driver: TBP⟩+≡
    procedure :: write_set_int_sub

⟨Prclib interfaces: procedures⟩+≡
    subroutine write_set_int_sub (driver, unit, prefix, feature)
        class(prclib_driver_t), intent(in) :: driver
        integer, intent(in) :: unit
        type(string_t), intent(in) :: prefix
        type(string_t), intent(in) :: feature
        integer :: i
        write (unit, "(A)") ""
        write (unit, "(9A)") "! Set table: ", char (feature)
        write (unit, "(9A)") "subroutine ", char (prefix), &
            "set_", char (feature), "_ptr (pid, ", char (feature), , &
            ", shape) bind(C)"
        write (unit, "(9A)") " use iso_c_binding"
        call driver%write_interfaces (unit, feature)
        write (unit, "(9A)") " integer(c_int), intent(in) :: pid"
        write (unit, "(9A)") " integer(c_int), dimension(*), intent(out) :: ", , &
            char (feature)
        write (unit, "(9A)") " integer(c_int), dimension(2), intent(in) :: shape"
        write (unit, "(9A)") " integer, dimension(:, :, ), allocatable :: ", , &
            char (feature), "_tmp"
        write (unit, "(9A)") " integer :: i, j"
        write (unit, "(9A)") " select case (pid)"
        do i = 1, driver%n_processes
            write (unit, "(2x,A,I0,A)") "case (", i, ")"
            call driver%record(i)%write_int_sub_call (unit, feature)
        end do
        write (unit, "(9A)") " end select"
        write (unit, "(9A)") "end subroutine ", char (prefix), ,
            "set_", char (feature), "_ptr"
    end subroutine write_set_int_sub

```

The actual call depends on the type of matrix element.

```

⟨Prclib interfaces: prclib driver record: TBP⟩+≡
    procedure :: write_int_sub_call => prclib_driver_record_write_int_sub_call

⟨Prclib interfaces: procedures⟩+≡
    subroutine prclib_driver_record_write_int_sub_call (record, unit, feature)
        class(prclib_driver_record_t), intent(in) :: record
        integer, intent(in) :: unit
        type(string_t), intent(in) :: feature
        call record%writer%write_int_sub_call (unit, record%id, feature)

```

```
end subroutine prclib_driver_record_write_int_sub_call
```

The interface goes into the writer base type:

```
(Prelib interfaces: prc writer: TBP)+≡
    procedure(write_feature_code), deferred :: write_int_sub_call

In the Fortran module case, we need an extra copy in the (academical) situation
where default integer and c_int differ. Otherwise, we just associate a Fortran
array with the C pointer and let the matrix-element subroutine fill the array.

(Prelib interfaces: prc writer f module: TBP)+≡
    procedure :: write_int_sub_call => prc_writer_f_module_write_int_sub_call

(Prelib interfaces: procedures)+≡
    subroutine prc_writer_f_module_write_int_sub_call (writer, unit, id, feature)
        class(prc_writer_f_module_t), intent(in) :: writer
        integer, intent(in) :: unit
        type(string_t), intent(in) :: id, feature
        write (unit, "(5x,9A)") "allocate (", char (feature), "_tmp ", &
            "(shape(1), shape(2)))"
        write (unit, "(5x,9A)") "call ", &
            char (writer%get_c_procname (id, feature)), &
            " (", char (feature), "_tmp)"
        write (unit, "(5x,9A)") "forall (i=1:shape(1), j=1:shape(2)) "
        write (unit, "(8x,9A)") char (feature), "(i + shape(1)*(j-1)) = ", &
            char (feature), "_tmp", "(i,j)"
        write (unit, "(5x,9A)") "end forall"
    end subroutine prc_writer_f_module_write_int_sub_call
```

In the C library case, we just transfer the C pointer to the library function.

```
(Prelib interfaces: prc writer c lib: TBP)+≡
    procedure :: write_int_sub_call => prc_writer_c_lib_write_int_sub_call

(Prelib interfaces: procedures)+≡
    subroutine prc_writer_c_lib_write_int_sub_call (writer, unit, id, feature)
        class(prc_writer_c_lib_t), intent(in) :: writer
        integer, intent(in) :: unit
        type(string_t), intent(in) :: id, feature
        write (unit, "(5x,9A)") "call ", &
            char (writer%get_c_procname (id, feature)), " (", char (feature), ")"
    end subroutine prc_writer_c_lib_write_int_sub_call
```

## Color state table

The color-state specification needs a table of integers (one array per color flow) and a corresponding array of color-ghost flags.

```
(Prelib interfaces: public)+≡
    public :: prc_set_col_state

(Prelib interfaces: interfaces)+≡
    abstract interface
        subroutine prc_set_col_state (pid, col_state, ghost_flag, shape) bind(C)
            import
            integer(c_int), intent(in) :: pid
```

```

        integer(c_int), dimension(*), intent(out) :: col_state
        logical(c_bool), dimension(*), intent(out) :: ghost_flag
        integer(c_int), dimension(3), intent(in) :: shape
    end subroutine prc_set_col_state
end interface

⟨Prclib interfaces: prclib driver: TBP⟩+≡
procedure :: write_set_col_state_sub

⟨Prclib interfaces: procedures⟩+≡
subroutine write_set_col_state_sub (driver, unit, prefix)
    class(prclib_driver_t), intent(in) :: driver
    integer, intent(in) :: unit
    type(string_t), intent(in) :: prefix
    integer :: i
    type(string_t) :: feature
    feature = "col_state"
    write (unit, "(A)") ""
    write (unit, "(9A)") "! Set tables: col_state, ghost_flag"
    write (unit, "(9A)") "subroutine ", char (prefix), &
        "set_col_state_ptr (pid, col_state, ghost_flag, shape) bind(C)"
    write (unit, "(9A)") " use iso_c_binding"
    call driver%write_interfaces (unit, feature)
    write (unit, "(9A)") " integer(c_int), intent(in) :: pid"
    write (unit, "(9A)") &
        " integer(c_int), dimension(*), intent(out) :: col_state"
    write (unit, "(9A)") &
        " logical(c_bool), dimension(*), intent(out) :: ghost_flag"
    write (unit, "(9A)") &
        " integer(c_int), dimension(3), intent(in) :: shape"
    write (unit, "(9A)") &
        " integer, dimension(:,:,:), allocatable :: col_state_tmp"
    write (unit, "(9A)") &
        " logical, dimension(:,:), allocatable :: ghost_flag_tmp"
    write (unit, "(9A)") " integer :: i, j, k"
    write (unit, "(A)") " select case (pid)"
    do i = 1, driver%n_processes
        write (unit, "(A,I0,A)") " case (", i, ")"
        call driver%record(i)%write_col_state_call (unit)
    end do
    write (unit, "(A)") " end select"
    write (unit, "(9A)") "end subroutine ", char (prefix), &
        "set_col_state_ptr"
end subroutine write_set_col_state_sub

```

The actual call depends on the type of matrix element.

```

⟨Prclib interfaces: prclib driver record: TBP⟩+≡
procedure :: write_col_state_call => prclib_driver_record_write_col_state_call

⟨Prclib interfaces: procedures⟩+≡
subroutine prclib_driver_record_write_col_state_call (record, unit)
    class(prclib_driver_record_t), intent(in) :: record
    integer, intent(in) :: unit
    call record%writer%write_col_state_call (unit, record%id)
end subroutine prclib_driver_record_write_col_state_call

```

The interface goes into the writer base type:

```
<Prclib interfaces: prc writer: TBP>+≡
procedure(write_code), deferred :: write_col_state_call
```

In the Fortran module case, we need an extra copy in the (academical) situation where default integer and c\_int differ. Otherwise, we just associate a Fortran array with the C pointer and let the matrix-element subroutine fill the array.

```
<Prclib interfaces: prc writer f module: TBP>+≡
procedure :: write_col_state_call => prc_writer_f_module_write_col_state_call
```

*<Prclib interfaces: procedures>+≡*

```
subroutine prc_writer_f_module_write_col_state_call (writer, unit, id)
  class(prc_writer_f_module_t), intent(in) :: writer
  integer, intent(in) :: unit
  type(string_t), intent(in) :: id
  write (unit, "(9A)") " allocate (col_state_tmp ", &
    "(shape(1), shape(2), shape(3)))"
  write (unit, "(5x,9A)") "allocate (ghost_flag_tmp ", &
    "(shape(2), shape(3)))"
  write (unit, "(5x,9A)") "call ", &
    char (writer%get_c_procname (id, var_str ("col_state"))), &
    "(col_state_tmp, ghost_flag_tmp)"
  write (unit, "(5x,9A)") "forall (i = 1:shape(2), j = 1:shape(3))"
  write (unit, "(8x,9A)") "forall (k = 1:shape(1))"
  write (unit, "(11x,9A)") &
    "col_state(k + shape(1) * (i + shape(2)*(j-1) - 1)) ", &
    "= col_state_tmp(k,i,j)"
  write (unit, "(8x,9A)") "end forall"
  write (unit, "(8x,9A)") &
    "ghost_flag(i + shape(2)*(j-1)) = ghost_flag_tmp(i,j)"
  write (unit, "(5x,9A)") "end forall"
end subroutine prc_writer_f_module_write_col_state_call
```

In the C library case, we just transfer the C pointer to the library function.

```
<Prclib interfaces: prc writer c lib: TBP>+≡
procedure :: write_col_state_call => prc_writer_c_lib_write_col_state_call
```

*<Prclib interfaces: procedures>+≡*

```
subroutine prc_writer_c_lib_write_col_state_call (writer, unit, id)
  class(prc_writer_c_lib_t), intent(in) :: writer
  integer, intent(in) :: unit
  type(string_t), intent(in) :: id
  write (unit, "(5x,9A)") "call ", &
    char (writer%get_c_procname (id, var_str ("col_state"))), &
    "(col_state, ghost_flag)"
end subroutine prc_writer_c_lib_write_col_state_call
```

## Color factors

For the color-factor information, we return two integer arrays and a complex array.

*<Prclib interfaces: public>+≡*

```

public :: prc_set_color_factors
<Prelib interfaces: interfaces>+≡
abstract interface
    subroutine prc_set_color_factors &
        (pid, cf_index1, cf_index2, color_factors, shape) bind(C)
        import
        integer(c_int), intent(in) :: pid
        integer(c_int), dimension(*), intent(out) :: cf_index1, cf_index2
        complex(c_default_complex), dimension(*), intent(out) :: color_factors
        integer(c_int), dimension(1), intent(in) :: shape
    end subroutine prc_set_color_factors
end interface

```

This subroutine returns the color-flavor factor table.

```

<Prelib interfaces: prclib driver: TBP>+≡
procedure :: write_set_color_factors_sub
<Prelib interfaces: procedures>+≡
subroutine write_set_color_factors_sub (driver, unit, prefix)
    class(prclib_driver_t), intent(in) :: driver
    integer, intent(in) :: unit
    type(string_t), intent(in) :: prefix
    integer :: i
    type(string_t) :: feature
    feature = "color_factors"
    write (unit, "(A)") ""
    write (unit, "(A)") "! Set tables: color factors"
    write (unit, "(9A)") "subroutine ", char (prefix), &
        "set_color_factors_ptr (pid, cf_index1, cf_index2, color_factors, ", &
        "shape) bind(C)"
    write (unit, "(A)") " use iso_c_binding"
    write (unit, "(A)") " use kinds"
    write (unit, "(A)") " use omega_color"
    call driver%write_interfaces (unit, feature)
    write (unit, "(A)") " integer(c_int), intent(in) :: pid"
    write (unit, "(A)") " integer(c_int), dimension(1), intent(in) :: shape"
    write (unit, "(A)") " integer(c_int), dimension(*), intent(out) :: &
        &cf_index1, cf_index2"
    write (unit, "(A)") " complex(c_default_complex), dimension(*), &
        &intent(out) :: color_factors"
    write (unit, "(A)") " type(omega_color_factor), dimension(:), &
        &allocatable :: cf"
    write (unit, "(A)") " select case (pid)"
    do i = 1, driver%n_processes
        write (unit, "(2x,A,I0,A)") "case (", i, ")"
        call driver%record(i)%write_color_factors_call (unit)
    end do
    write (unit, "(A)") " end select"
    write (unit, "(A)") "end subroutine " // char (prefix) &
        // "set_color_factors_ptr"
end subroutine write_set_color_factors_sub

```

The actual call depends on the type of matrix element.

```
(Prelib interfaces: prclib driver record: TBP)+≡
    procedure :: write_color_factors_call => prclib_driver_record_write_color_factors_call
(Prelib interfaces: procedures)+≡
    subroutine prclib_driver_record_write_color_factors_call (record, unit)
        class(prclib_driver_record_t), intent(in) :: record
        integer, intent(in) :: unit
        call record%writer%write_color_factors_call (unit, record%id)
    end subroutine prclib_driver_record_write_color_factors_call
```

The interface goes into the writer base type:

```
(Prelib interfaces: prc writer: TBP)+≡
    procedure(write_code), deferred :: write_color_factors_call
```

In the Fortran module case, the matrix-element procedure fills an array of omega\_color\_factor elements. We distribute this array among two integer arrays and one complex-valued array, for which we have the C pointers.

```
(Prelib interfaces: prc writer f module: TBP)+≡
    procedure :: write_color_factors_call => prc_writer_f_module_write_color_factors_call
(Prelib interfaces: procedures)+≡
    subroutine prc_writer_f_module_write_color_factors_call (writer, unit, id)
        class(prc_writer_f_module_t), intent(in) :: writer
        integer, intent(in) :: unit
        type(string_t), intent(in) :: id
        write (unit, "(5x,A)") "allocate (cf (shape(1)))"
        write (unit, "(5x,9A)") "call ", &
            char (writer%get_c_procname (id, var_str ("color_factors"))), " (cf)"
        write (unit, "(5x,9A)") "cf_index1(1:shape(1)) = cf%i1"
        write (unit, "(5x,9A)") "cf_index2(1:shape(1)) = cf%i2"
        write (unit, "(5x,9A)") "color_factors(1:shape(1)) = cf%factor"
    end subroutine prc_writer_f_module_write_color_factors_call
```

In the C library case, we just transfer the C pointers to the library function. There are three arrays.

```
(Prelib interfaces: prc writer c lib: TBP)+≡
    procedure :: write_color_factors_call => &
        prc_writer_c_lib_write_color_factors_call
(Prelib interfaces: procedures)+≡
    subroutine prc_writer_c_lib_write_color_factors_call (writer, unit, id)
        class(prc_writer_c_lib_t), intent(in) :: writer
        integer, intent(in) :: unit
        type(string_t), intent(in) :: id
        write (unit, "(5x,9A)") "call ", &
            char (writer%get_c_procname (id, var_str ("color_factors"))), &
            " (cf_index1, cf_index2, color_factors)"
    end subroutine prc_writer_c_lib_write_color_factors_call
```

### 13.2.10 Interfaces for C-library matrix element

If the matrix element code is not provided as a Fortran module but as a C or bind(C) Fortran library, we need explicit interfaces for the library functions. They are not identical to the Fortran module versions. They transfer pointers directly.

The implementation is part of the `prc_writer_c_lib` type, which serves as base type for all C-library writers. It writes specific interfaces depending on the feature.

We bind this as the method `write_standard_interface` instead of `write_interface`, because we have to override the latter. Otherwise we could not call the method because the writer type is abstract.

```
<Prelib interfaces: prc writer c lib: TBP>+≡
procedure :: write_standard_interface => prc_writer_c_lib_write_interface
(Prelib interfaces: procedures)>+≡
subroutine prc_writer_c_lib_write_interface (writer, unit, id, feature)
  class(prc_writer_c_lib_t), intent(in) :: writer
  integer, intent(in) :: unit
  type(string_t), intent(in) :: id, feature
  select case (char (feature))
  case ("md5sum")
    write (unit, "(2x,9A)") "interface"
    write (unit, "(5x,9A)") "function ", &
      char (writer%get_c_procname (id, var_str ("get_md5sum"))), &
      " () result (cptr) bind(C)"
    write (unit, "(7x,9A)") "import"
    write (unit, "(7x,9A)") "implicit none"
    write (unit, "(7x,9A)") "type(c_ptr) :: cptr"
    write (unit, "(5x,9A)") "end function ", &
      char (writer%get_c_procname (id, var_str ("get_md5sum")))
    write (unit, "(2x,9A)") "end interface"
  case ("openmp_supported")
    write (unit, "(2x,9A)") "interface"
    write (unit, "(5x,9A)") "function ", &
      char (writer%get_c_procname (id, feature)), &
      " () result (status) bind(C)"
    write (unit, "(7x,9A)") "import"
    write (unit, "(7x,9A)") "implicit none"
    write (unit, "(7x,9A)") "logical(c_bool) :: status"
    write (unit, "(5x,9A)") "end function ", &
      char (writer%get_c_procname (id, feature))
    write (unit, "(2x,9A)") "end interface"
  case ("n_in", "n_out", "n_flv", "n_hel", "n_col", "n_cin", "n_cf")
    write (unit, "(2x,9A)") "interface"
    write (unit, "(5x,9A)") "function ", &
      char (writer%get_c_procname (id, feature)), &
      " () result (n) bind(C)"
    write (unit, "(7x,9A)") "import"
    write (unit, "(7x,9A)") "implicit none"
    write (unit, "(7x,9A)") "integer(c_int) :: n"
    write (unit, "(5x,9A)") "end function ", &
      char (writer%get_c_procname (id, feature))
    write (unit, "(2x,9A)") "end interface"
```

```

case ("flv_state", "hel_state")
    write (unit, "(2x,9A)")  "interface"
    write (unit, "(5x,9A)")  "subroutine ", &
        char (writer%get_c_procname (id, feature)), &
        " (", char (feature), ") bind(C)"
    write (unit, "(7x,9A)")  "import"
    write (unit, "(7x,9A)")  "implicit none"
    write (unit, "(7x,9A)")  "integer(c_int), dimension(*), intent(out) ", &
        ":: ", char (feature)
    write (unit, "(5x,9A)")  "end subroutine ", &
        char (writer%get_c_procname (id, feature))
    write (unit, "(2x,9A)")  "end interface"
case ("col_state")
    write (unit, "(2x,9A)")  "interface"
    write (unit, "(5x,9A)")  "subroutine ", &
        char (writer%get_c_procname (id, feature)), &
        " (col_state, ghost_flag) bind(C)"
    write (unit, "(7x,9A)")  "import"
    write (unit, "(7x,9A)")  "implicit none"
    write (unit, "(7x,9A)")  "integer(c_int), dimension(*), intent(out) ", &
        ":: col_state"
    write (unit, "(7x,9A)")  "logical(c_bool), dimension(*), intent(out) ", &
        ":: ghost_flag"
    write (unit, "(5x,9A)")  "end subroutine ", &
        char (writer%get_c_procname (id, feature))
    write (unit, "(2x,9A)")  "end interface"
case ("color_factors")
    write (unit, "(2x,9A)")  "interface"
    write (unit, "(5x,9A)")  "subroutine ", &
        char (writer%get_c_procname (id, feature)), &
        " (cf_index1, cf_index2, color_factors) bind(C)"
    write (unit, "(7x,9A)")  "import"
    write (unit, "(7x,9A)")  "implicit none"
    write (unit, "(7x,9A)")  "integer(c_int), dimension(*), &
        &intent(out) :: cf_index1"
    write (unit, "(7x,9A)")  "integer(c_int), dimension(*), &
        &intent(out) :: cf_index2"
    write (unit, "(7x,9A)")  "complex(c_default_complex), dimension(*), &
        &intent(out) :: color_factors"
    write (unit, "(5x,9A)")  "end subroutine ", &
        char (writer%get_c_procname (id, feature))
    write (unit, "(2x,9A)")  "end interface"
end select
end subroutine prc_writer_c_lib_write_interface

```

### 13.2.11 Retrieving the tables

In the previous section we had the writer routines for procedures that return tables, actually C pointers to tables. Here, we write convenience routines that unpack them and move the contents to suitable Fortran arrays.

The flavor and helicity tables are two-dimensional integer arrays. We use intermediate storage for correctly transforming C to Fortran data types.

```

⟨Prclib interfaces: prclib driver: TBP⟩+≡
procedure :: set_flv_state => prclib_driver_set_flv_state
procedure :: set_hel_state => prclib_driver_set_hel_state
⟨Prclib interfaces: procedures⟩+≡
subroutine prclib_driver_set_flv_state (driver, i, flv_state)
  class(prclib_driver_t), intent(in) :: driver
  integer, intent(in) :: i
  integer, dimension(:, :, ), allocatable, intent(out) :: flv_state
  integer :: n_tot, n_flv
  integer(c_int) :: pid
  integer(c_int), dimension(:, :, ), allocatable :: c_flv_state
  pid = i
  n_tot = driver%get_n_in (pid) + driver%get_n_out (pid)
  n_flv = driver%get_n_flv (pid)
  allocate (flv_state (n_tot, n_flv))
  allocate (c_flv_state (n_tot, n_flv))
  call driver%set_flv_state_ptr &
    (pid, c_flv_state, int ([n_tot, n_flv], kind=c_int))
  flv_state = c_flv_state
end subroutine prclib_driver_set_flv_state

subroutine prclib_driver_set_hel_state (driver, i, hel_state)
  class(prclib_driver_t), intent(in) :: driver
  integer, intent(in) :: i
  integer, dimension(:, :, ), allocatable, intent(out) :: hel_state
  integer :: n_tot, n_hel
  integer(c_int) :: pid
  integer(c_int), dimension(:, :, ), allocatable, target :: c_hel_state
  pid = i
  n_tot = driver%get_n_in (pid) + driver%get_n_out (pid)
  n_hel = driver%get_n_hel (pid)
  allocate (hel_state (n_tot, n_hel))
  allocate (c_hel_state (n_tot, n_hel))
  call driver%set_hel_state_ptr &
    (pid, c_hel_state, int ([n_tot, n_hel], kind=c_int))
  hel_state = c_hel_state
end subroutine prclib_driver_set_hel_state

```

The color-flow table is three-dimensional, otherwise similar. We simultaneously set the ghost-flag table, which consists of logical entries.

```

⟨Prclib interfaces: prclib driver: TBP⟩+≡
procedure :: set_col_state => prclib_driver_set_col_state
⟨Prclib interfaces: procedures⟩+≡
subroutine prclib_driver_set_col_state (driver, i, col_state, ghost_flag)
  class(prclib_driver_t), intent(in) :: driver
  integer, intent(in) :: i
  integer, dimension(:, :, :, ), allocatable, intent(out) :: col_state
  logical, dimension(:, :, ), allocatable, intent(out) :: ghost_flag
  integer :: n_cin, n_tot, n_col
  integer(c_int) :: pid
  integer(c_int), dimension(:, :, :, ), allocatable :: c_col_state
  logical(c_bool), dimension(:, :, ), allocatable :: c_ghost_flag
  pid = i

```

```

n_cin = driver%get_n_cin (pid)
n_tot = driver%get_n_in (pid) + driver%get_n_out (pid)
n_col = driver%get_n_col (pid)
allocate (col_state (n_cin, n_tot, n_col))
allocate (c_col_state (n_cin, n_tot, n_col))
allocate (ghost_flag (n_tot, n_col))
allocate (c_ghost_flag (n_tot, n_col))
call driver%set_col_state_ptr (pid, &
    c_col_state, c_ghost_flag, int ([n_cin, n_tot, n_col], kind=c_int))
col_state = c_col_state
ghost_flag = c_ghost_flag
end subroutine prclib_driver_set_col_state

```

The color-factor table is a sparse matrix: a two-column array of indices and one array which contains the corresponding factors.

```

⟨Prclib interfaces: prclib driver: TBP⟩+≡
procedure :: set_color_factors => prclib_driver_set_color_factors
⟨Prclib interfaces: procedures⟩+≡
subroutine prclib_driver_set_color_factors (driver, i, color_factors, cf_index)
    class(prclib_driver_t), intent(in) :: driver
    integer, intent(in) :: i
    complex(default), dimension(:, ), allocatable, intent(out) :: color_factors
    integer, dimension(:, :, ), allocatable, intent(out) :: cf_index
    integer :: n_cf
    integer(c_int) :: pid
    complex(c_default_complex), dimension(:, ), allocatable, target :: c_color_factors
    integer(c_int), dimension(:, ), allocatable, target :: c_cf_index1
    integer(c_int), dimension(:, ), allocatable, target :: c_cf_index2
    pid = i
    n_cf = driver%get_n_cf (pid)
    allocate (color_factors (n_cf))
    allocate (c_color_factors (n_cf))
    allocate (c_cf_index1 (n_cf))
    allocate (c_cf_index2 (n_cf))
    call driver%set_color_factors_ptr (pid, &
        c_cf_index1, c_cf_index2, &
        c_color_factors, int ([n_cf], kind=c_int))
    color_factors = c_color_factors
    allocate (cf_index (2, n_cf))
    cf_index(1,:) = c_cf_index1
    cf_index(2,:) = c_cf_index2
end subroutine prclib_driver_set_color_factors

```

### 13.2.12 Returning a procedure pointer

The functions that directly access the matrix element, event by event, are assigned to a process-specific driver object as procedure pointers. For the `dlopen` interface, we use C function pointers. This subroutine returns such a pointer:

```

⟨Prclib interfaces: public⟩+≡
public :: prc_get_fptr

```

```

⟨Prclib interfaces: interfaces⟩+≡
  abstract interface
    subroutine prc_get_fptr (pid, fid, fptr) bind(C)
      import
      integer(c_int), intent(in) :: pid
      integer(c_int), intent(in) :: fid
      type(c_funptr), intent(out) :: fptr
    end subroutine prc_get_fptr
  end interface

```

This procedure writes the source code for the procedure pointer returning subroutine.

All C functions that are provided by the matrix element code of a specific process are handled here. The selection consists of a double layered **select case** construct.

```

⟨Prclib interfaces: prclib driver: TBP⟩+≡
  procedure :: write_get_fptr_sub

⟨Prclib interfaces: procedures⟩+≡
  subroutine write_get_fptr_sub (driver, unit, prefix)
    class(prclib_driver_t), intent(in) :: driver
    integer, intent(in) :: unit
    type(string_t), intent(in) :: prefix
    integer :: i, j
    write (unit, "(A)") ""
    write (unit, "(A)") "! Return C pointer to a procedure:"
    write (unit, "(A)") "! pid = process index; fid = function index"
    write (unit, "(4A)") "subroutine ", char (prefix), "get_fptr ", &
      "(pid, fid, fptr) bind(C)"
    write (unit, "(A)") "  use iso_c_binding"
    write (unit, "(A)") "  use kinds"
    write (unit, "(A)") "  implicit none"
    write (unit, "(A)") "  integer(c_int), intent(in) :: pid"
    write (unit, "(A)") "  integer(c_int), intent(in) :: fid"
    write (unit, "(A)") "  type(c_funptr), intent(out) :: fptr"
    do i = 1, driver%n_processes
      call driver%record(i)%write_interfaces (unit)
    end do
    write (unit, "(A)") "  select case (pid)"
    do i = 1, driver%n_processes
      write (unit, "(2x,A,I0,A)") "case (", i, ")"
      write (unit, "(5x,A)") "select case (fid)"
      associate (record => driver%record(i))
        do j = 1, size (record%feature)
          write (unit, "(5x,A,I0,9A)") "case (", j, ");  ", &
            "fptr = c_funloc (", &
            char (record%get_c_procname (record%feature(j))), &
            ")"
        end do
      end associate
      write (unit, "(5x,A)") "end select"
    end do
    write (unit, "(A)") "  end select"
    write (unit, "(3A)") "end subroutine ", char (prefix), "get_fptr"

```

```
end subroutine write_get_fptr_sub
```

The procedures for which we want to return a pointer (the 'features' of the matrix element code) are actually Fortran module procedures. If we want to have a C signature, we must write wrapper functions for all of them. The procedures, their signatures, and the appropriate writer routines are specific for the process type.

To keep this generic, we do not provide the writer routines here, but just the interface for a writer routine. The actual routines are stored in the process record.

The `prefix` indicates the library, the `id` indicates the process, and `procname` is the bare name of the procedure to be written.

```
<Prelib interfaces: public>+≡
  public :: write_driver_code

<Prelib interfaces: interfaces>+≡
  abstract interface
    subroutine write_driver_code (unit, prefix, id, procname)
      import
      integer, intent(in) :: unit
      type(string_t), intent(in) :: prefix
      type(string_t), intent(in) :: id
      type(string_t), intent(in) :: procname
    end subroutine write_driver_code
  end interface
```

### 13.2.13 Hooks

Interface for additional library unload / reload hooks (currently unused!)

```
<Prelib interfaces: public>+≡
  public :: prclib_unload_hook
  public :: prclib_reload_hook

<Prelib interfaces: interfaces>+≡
  abstract interface
    subroutine prclib_unload_hook (libname)
      import
      type(string_t), intent(in) :: libname
    end subroutine prclib_unload_hook

    subroutine prclib_reload_hook (libname)
      import
      type(string_t), intent(in) :: libname
    end subroutine prclib_reload_hook
  end interface
```

### 13.2.14 Make source, compile, link

Since we should have written a Makefile, these tasks amount to simple `make` calls. Note that the Makefile targets depend on each other, so calling `link` executes also the `source` and `compile` steps, when necessary.

The first routine writes source-code files for the individual processes. First it calls the writer routines directly for each process, then it calls `make_source`. The `make` command may either post-process the files, or it may do the complete work, e.g., calling an external program the generates the files.

```
<Prclib interfaces: prclib driver: TBP>+≡
procedure :: make_source => prclib_driver_make_source
<Prclib interfaces: procedures>+≡
subroutine prclib_driver_make_source (driver, os_data)
  class(prclib_driver_t), intent(in) :: driver
  type(os_data_t), intent(in) :: os_data
  integer :: i
  do i = 1, driver%n_processes
    call driver%record(i)%write_source_code ()
  end do
  call os_system_call ("make source " // os_data%makeflags &
    // " -f " // driver%basename // ".makefile")
end subroutine prclib_driver_make_source
```

Compile matrix element source code and the driver source code.

```
<Prclib interfaces: prclib driver: TBP>+≡
procedure :: make_compile => prclib_driver_make_compile
<Prclib interfaces: procedures>+≡
subroutine prclib_driver_make_compile (driver, os_data)
  class(prclib_driver_t), intent(in) :: driver
  type(os_data_t), intent(in) :: os_data
  call os_system_call ("make compile " // os_data%makeflags &
    // " -f " // driver%basename // ".makefile")
end subroutine prclib_driver_make_compile
```

Combine all matrix-element code together with the driver in a process library on disk.

```
<Prclib interfaces: prclib driver: TBP>+≡
procedure :: make_link => prclib_driver_make_link
<Prclib interfaces: procedures>+≡
subroutine prclib_driver_make_link (driver, os_data)
  class(prclib_driver_t), intent(in) :: driver
  type(os_data_t), intent(in) :: os_data
  call os_system_call ("make link " // os_data%makeflags &
    // " -f " // driver%basename // ".makefile")
end subroutine prclib_driver_make_link
```

### 13.2.15 Clean up generated files

The task of cleaning any generated files should also be deferred to Makefile targets. Apart from removing everything, removing specific files may be useful for partial rebuilds. (Note that removing the makefile itself can only be done once, for obvious reasons.)

If there is no makefile, do nothing.

```
<Prclib interfaces: prclib driver: TBP>+≡
```

```

procedure :: clean_library => prclib_driver_clean_library
procedure :: clean_objects => prclib_driver_clean_objects
procedure :: clean_source => prclib_driver_clean_source
procedure :: clean_driver => prclib_driver_clean_driver
procedure :: clean_makefile => prclib_driver_clean_makefile
procedure :: clean => prclib_driver_clean
procedure :: distclean => prclib_driver_distclean

(Prclib interfaces: procedures) +≡

subroutine prclib_driver_clean_library (driver, os_data)

                      // " -f " // driver%basename // ".makefile")
end if
end subroutine prclib_driver_distclean

```

This Make target should remove all files that apply to a specific process. We execute this when we want to force remaking source code. Note that source targets need not have prerequisites, so just calling `make_source` would not do anything if the files exist.

```

⟨Prclib interfaces: prclib driver: TBP⟩+≡
procedure :: clean_proc => prclib_driver_clean_proc

⟨Prclib interfaces: procedures⟩+≡
subroutine prclib_driver_clean_proc (driver, i, os_data)
class(prclib_driver_t), intent(in) :: driver
integer, intent(in) :: i
type(os_data_t), intent(in) :: os_data
type(string_t) :: id
if (driver%makefile_exists ()) then
    id = driver%record(i)%id
    call os_system_call ("make clean-" // driver%record(i)%id // " " &
                      // os_data%makeflags &
                      // " -f " // driver%basename // ".makefile")
end if
end subroutine prclib_driver_clean_proc

```

### 13.2.16 Further Tools

Check for the appropriate makefile.

```

⟨Prclib interfaces: prclib driver: TBP⟩+≡
procedure :: makefile_exists => prclib_driver_makefile_exists

⟨Prclib interfaces: procedures⟩+≡
function prclib_driver_makefile_exists (driver) result (flag)
class(prclib_driver_t), intent(in) :: driver
logical :: flag
inquire (file = char (driver%basename) // ".makefile", exist = flag)
end function prclib_driver_makefile_exists

```

### 13.2.17 Load the library

Once the library has been linked, we can dlopen it and assign all procedure pointers to their proper places in the library driver object. The `loaded` flag is set only if all required pointers have become assigned.

```

⟨Prclib interfaces: prclib driver: TBP⟩+≡
procedure :: load => prclib_driver_load
⟨Prclib interfaces: procedures⟩+≡
subroutine prclib_driver_load (driver, os_data, noerror)
  class(prclib_driver_t), intent(inout) :: driver
  type(os_data_t), intent(in) :: os_data
  logical, intent(in), optional :: noerror
  type(c_funptr) :: c_fptr
  logical :: ignore

  ignore = .false.;  if (present (noerror))  ignore = noerror

  driver%libname = os_get_dlname (driver%basename, os_data, noerror, noerror)
  if (driver%libname == "")  return
  select type (driver)

```

This version of test-code writer writes interfaces for all standard features plus one specific feature. The interfaces are all bind(C), so no wrapper is needed.

The driver part is identical to the Fortran case, so we simply extend the previous `test_writer_5` type. We only have to override the Makefile writer.

```

⟨Prclib interfaces: test types⟩+≡
type, extends (test_writer_5_t) :: test_writer_6_t
contains
  procedure, nopass :: type_name => test_writer_6_type_name
  procedure :: write_makefile_code => test_writer_6_mk
  procedure :: write_source_code => test_writer_6_src
end type test_writer_6_t

```

```

⟨Prclib interfaces: test auxiliary⟩+≡
function test_writer_6_type_name () result (string)
  type(string_t) :: string
  string = "test_6"

  write (u, "(2x,A,A,L1)") file, " = ", exist
end subroutine check_file

```

### 13.3 Abstract process core configuration

In this module, we define abstract data types that handle the method-specific part of defining a process (including all of its options) and accessing an external matrix element.

There are no unit tests, these are deferred to the `process_libraries` module below.

```

⟨prc_core_def.f90⟩≡
⟨File header⟩

```

```

module prc_core_def

⟨Use strings⟩
  use io_units
  use diagnostics

  use process_constants
  use prclib_interfaces

⟨Standard module head⟩

```

```

⟨Prc core def: public⟩

⟨Prc core def: types⟩

⟨Prc core def: interfaces⟩

contains

⟨Prc core def: procedures⟩

end module prc_core_def

```

### 13.3.1 Process core definition type

For storing configuration data that depend on the specific process variant, we introduce a polymorphic type. At this point, we just declare an abstract base type. This allows us to defer the implementation to later modules.

There should be no components that need explicit finalization, otherwise we would have to call a finalizer from the `process_component_def_t` wrapper.

```

⟨Prc core def: public⟩≡
    public :: prc_core_def_t

⟨Prc core def: types⟩≡
    type, abstract :: prc_core_def_t
        class(prc_writer_t), allocatable :: writer
    contains
        ⟨Prc core def: process core def: TBP⟩
    end type prc_core_def_t

```

Interfaces for the deferred methods.

This returns a string. No passed argument; the string is constant and depends just on the type.

```

⟨Prc core def: process core def: TBP⟩≡
    procedure (prc_core_def_get_string), nopass, deferred :: type_string

⟨Prc core def: interfaces⟩≡
    abstract interface
        function prc_core_def_get_string () result (string)
            import
            type(string_t) :: string
        end function prc_core_def_get_string
    end interface

```

The `write` method should display the content completely.

```

⟨Prc core def: process core def: TBP⟩+≡
    procedure (prc_core_def_write), deferred :: write

⟨Prc core def: interfaces⟩+≡
    abstract interface
        subroutine prc_core_def_write (object, unit)
            import
            class(prc_core_def_t), intent(in) :: object

```

```

    integer, intent(in) :: unit
end subroutine prc_core_def_write
end interface
```

The `read` method should fill the content completely.

```

⟨Prc core def: process core def: TBP⟩+≡
procedure (prc_core_def_read), deferred :: read
⟨Prc core def: interfaces⟩+≡
abstract interface
subroutine prc_core_def_read (object, unit)
import
class(prc_core_def_t), intent(out) :: object
integer, intent(in) :: unit
end subroutine prc_core_def_read
end interface
```

This communicates a MD5 checksum to the writer inside the `core_def` object, if there is any. Usually, this checksum is not yet known at the time when the writer is initialized.

```

⟨Prc core def: process core def: TBP⟩+≡
procedure :: set_md5sum => prc_core_def_set_md5sum
⟨Prc core def: procedures⟩≡
subroutine prc_core_def_set_md5sum (core_def, md5sum)
class(prc_core_def_t), intent(inout) :: core_def
character(32) :: md5sum
if (allocated (core_def%writer)) core_def%writer%md5sum = md5sum
end subroutine prc_core_def_set_md5sum
```

Allocate an appropriate driver object which corresponds to the chosen process core definition.

For internal matrix element (i.e., those which do not need external code), the driver should have access to all matrix element information from the beginning. In short, it is the matrix-element code.

For external matrix elements, the driver will get access to the external matrix element code.

```

⟨Prc core def: process core def: TBP⟩+≡
procedure(prc_core_def_allocate_driver), deferred :: allocate_driver
⟨Prc core def: interfaces⟩+≡
abstract interface
subroutine prc_core_def_allocate_driver (object, driver, basename)
import
class(prc_core_def_t), intent(in) :: object
class(prc_core_driver_t), intent(out), allocatable :: driver
type(string_t), intent(in) :: basename
end subroutine prc_core_def_allocate_driver
end interface
```

This flag tells whether the particular variant needs external code. We implement a default function which returns false. The flag depends only on the type, therefore we implement it as `nopass`.

```
(Prc core def: process core def: TBP)+≡
procedure, nopass :: needs_code => prc_core_def_needs_code
(Prc core def: procedures)+≡
function prc_core_def_needs_code () result (flag)
logical :: flag
flag = .false.
end function prc_core_def_needs_code
```

This subroutine allocates an array which holds the name of all features that this process core implements. This feature applies to matrix element code that is not coded as a Fortran module but communicates via independent library functions, which follow the C calling conventions. The addresses of those functions are returned as C function pointers, which can be converted into Fortran procedure pointers. The conversion is done in code specific for the process variant; here we just retrieve the C function pointer.

The array returned here serves the purpose of writing specific driver code. The driver interfaces only those C functions which are supported for the given process core.

If the process core does not require external code, this array is meaningless.

```
(Prc core def: process core def: TBP)+≡
procedure(prc_core_def_get_features), nopass, deferred &
:: get_features
(Prc core def: interfaces)+≡
abstract interface
    subroutine prc_core_def_get_features (features)
        import
        type(string_t), dimension(:), allocatable, intent(out) :: features
    end subroutine prc_core_def_get_features
end interface
```

Assign pointers to the process-specific procedures to the driver, if the process is external.

```
(Prc core def: process core def: TBP)+≡
procedure(prc_core_def_connect), deferred :: connect
(Prc core def: interfaces)+≡
abstract interface
    subroutine prc_core_def_connect (def, lib_driver, i, proc_driver)
        import
        class(prc_core_def_t), intent(in) :: def
        class(prclib_driver_t), intent(in) :: lib_driver
        integer, intent(in) :: i
        class(prc_core_driver_t), intent(inout) :: proc_driver
    end subroutine prc_core_def_connect
end interface
```

### 13.3.2 Process core template

We must be able to automatically allocate a process core definition object with the appropriate type, given only the type name.

To this end, we introduce a `prc_template_t` type which is simply a wrapper for an empty `prc_core_def_t` object. Choosing one of the templates from an array, we can allocate the target object.

```
(Prc core def: public)+≡  
    public :: prc_template_t  
  
(Prc core def: types)+≡  
    type :: prc_template_t  
        class(prc_core_def_t), allocatable :: core_def  
    end type prc_template_t
```

The allocation routine. We use the `source` option of the `allocate` statement. The `mold` option would probably more appropriate, but is a F2008 feature.

```
(Prc core def: public)+≡  
    public :: allocate_core_def  
  
(Prc core def: procedures)+≡  
    subroutine allocate_core_def (template, name, core_def)  
        type(prc_template_t), dimension(:), intent(in) :: template  
        type(string_t), intent(in) :: name  
        class(prc_core_def_t), allocatable :: core_def  
        integer :: i  
        do i = 1, size (template)  
            if (template(i)%core_def%type_string () == name) then  
                allocate (core_def, source = template(i)%core_def)  
                return  
            end if  
        end do  
    end subroutine allocate_core_def
```

### 13.3.3 Process driver

For each process component, we implement a driver object which holds the calls to the matrix element and various auxiliary routines as procedure pointers. Any actual calculation will use this object to communicate with the process.

Depending on the type of process (as described by a corresponding `prc_core_def` object), the procedure pointers may refer to external or internal code, and there may be additional procedures for certain types. The base type defined here is abstract.

```
(Prc core def: public)+≡  
    public :: prc_core_driver_t  
  
(Prc core def: types)+≡  
    type, abstract :: prc_core_driver_t  
        contains  
            (Prc core def: process driver: TBP)  
    end type prc_core_driver_t
```

This returns the process type. No reference to contents.

```
(Prc core def: process driver: TBP)≡
    procedure(prc_core_driver_type_name), nopass, deferred :: type_name
(Prc core def: interfaces)+≡
    abstract interface
        function prc_core_driver_type_name () result (type)
            import
            type(string_t) :: type
        end function prc_core_driver_type_name
    end interface
```

### 13.3.4 Process driver for intrinsic process

This is an abstract extension for the driver type. It has one additional method, namely a subroutine that fills the record of constant process data. For an external process, this task is performed by the external library driver instead.

```
(Prc core def: public)+≡
    public :: process_driver_internal_t
(Prc core def: types)+≡
    type, extends (prc_core_driver_t), abstract :: process_driver_internal_t
    contains
(Prc core def: process driver internal: TBP)
end type process_driver_internal_t

(Prc core def: process driver internal: TBP)≡
    procedure(process_driver_fill_constants), deferred :: fill_constants
(Prc core def: interfaces)+≡
    abstract interface
        subroutine process_driver_fill_constants (driver, data)
            import
            class(process_driver_internal_t), intent(in) :: driver
            type(process_constants_t), intent(out) :: data
        end subroutine process_driver_fill_constants
    end interface
```

### 13.3.5 Process driver for user-defined processes

This is another abstract extension of the driver type. It links user-defined matrix element methods like BLHA, which also allow the direct calculation of squared matrix elements.

```
(Prc core def: public)+≡
    public :: prc_user_defined_base_driver_t
(Prc core def: types)+≡
    type, abstract, extends (prc_core_driver_t) :: prc_user_defined_base_driver_t
    contains
(Prc core def: prc user defined base driver: TBP)
end type prc_user_defined_base_driver_t
```

## 13.4 Process library access

Processes (the code and data that are necessary for evaluating matrix elements of a particular process or process component) are organized in process libraries. In full form, process libraries contain generated and dynamically compiled and linked code, so they are actual libraries on the OS level. Alternatively, there may be simple processes that can be generated without referring to external libraries, and external libraries that are just linked in.

This module interfaces the OS to create, build, and use process libraries.

We work with two related data structures. There is the list of process configurations that stores the user input and data derived from it. A given process configuration list is scanned for creating a process library, which consists of both data and code. The creation step involves calling external programs and incorporating external code.

For the subsequent integration and event generation steps, we read the process library. We also support partial (re)creation of the process library. To this end, we should be able to reconstruct the configuration data records from the process library.

```
<process_libraries.f90>≡
  <File header>

  module process_libraries

    use, intrinsic :: iso_c_binding !NODEP!

    <Use strings>
    use io_units
    use diagnostics
    use md5
    use physics_defs, only: BORN, NLO_REAL, NLO_VIRTUAL, NLO_PDF
    use physics_defs, only: NLO_SUBTRACTION, GKS
    use os_interface
    use model_data
    use particle_specifiers
    use process_constants
    use prclib_interfaces
    use prc_core_def

  <Standard module head>

  <Process libraries: public>

  <Process libraries: parameters>

  <Process libraries: types>

  contains

  <Process libraries: procedures>

  end module process_libraries
```

### 13.4.1 Auxiliary stuff

Here is a small subroutine that strips the left-hand side and the equals sign off an equation.

```
<Process libraries: public>≡
  public :: strip_equation_lhs

<Process libraries: procedures>≡
  subroutine strip_equation_lhs (buffer)
    character(*), intent(inout) :: buffer
    type(string_t) :: string, prefix
    string = buffer
    call split (string, prefix, "=")
    buffer = string
  end subroutine strip_equation_lhs
```

### 13.4.2 Process definition objects

We collect process configuration data in a derived type, `process_def_t`. A process can be a collection of several components which are treated as a single entity for the purpose of observables and event generation. Multiple process components may initially be defined by the user. The system may add additional components, e.g., subtraction terms. The common data type is `process_component_def_t`. Within each component, there are several universal data items, and a part which depend on the particular process variant. The latter is covered by an abstract type `prc_core_def_t` and its extensions.

#### Wrapper for components

We define a wrapper type for the configuration of individual components.

The string `basename` is used for building file, module, and function names for the current process component. Initially, it will be built from the corresponding process basename by appending an alphanumeric suffix.

The logical `initial` tells whether this is a user-defined (true) or system-generated (false) configuration.

The numbers `n_in`, `n_out`, and `n_tot` denote the incoming, outgoing and total number of particles (partons) participating in the process component, respectively. These are the nominal particles, as input by the user (recombination may change the particle content, for the output events).

The string arrays `prt_in` and `prt_out` hold the particle specifications as provided by the user. For a system-generated process component, they remain deallocated.

The `method` string is used to determine the type of process matrix element and how it is obtained.

The `description` string collects the information about particle content and method in a single human-readable string.

The pointer object `core_def` is allocated according to the actual process variant, which depends on the method. The subobject holds any additional configuration data that is relevant for the process component.

We assume that no finalizer is needed.

```

⟨Process libraries: public⟩+≡
    public :: process_component_def_t

⟨Process libraries: types⟩≡
    type :: process_component_def_t
        private
        type(string_t) :: basename
        logical :: initial = .false.
        integer :: n_in = 0
        integer :: n_out = 0
        integer :: n_tot = 0
        type(prt_spec_t), dimension(:, allocatable :: prt_in
        type(prt_spec_t), dimension(:, allocatable :: prt_out
        type(string_t) :: method

```

Compute the MD5 sum of a process component. We reset the stored MD5 sum to the empty string (so a previous value is not included in the calculation), the write a temporary file and calculate the MD5 sum of that file.

This implies that all data that are displayed by the `write` method become part of the MD5 sum calculation.

The `model` is not part of the object, but must be included in the MD5 sum. Otherwise, modifying the model and nothing else would not trigger remaking the process-component source. Note that the model parameters may change later and therefore are not incorporated.

After the MD5 sum of the component has been computed, we communicate it to the `writer` subobject of the specific `core_def` component. Although these types are abstract, the MD5-related features are valid for the abstract types.

```
(Process libraries: process component def: TBP)+≡
procedure :: compute_md5sum => process_component_def_compute_md5sum

(Process libraries: procedures)+≡
subroutine process_component_def_compute_md5sum (component, model)
  class(process_component_def_t), intent(inout) :: component

## Process definition

The process component definitions are collected in a common process definition object.

The `id` is the ID string that the user has provided for identifying this process. It must be a string that is allowed as part of a Fortran variable name, since it may be used for generating code.

The number `n_in` is 1 or 2 for a decay or scattering process, respectively. This must be identical to `n_in` for all components.

The initial and extra component definitions (see above) are allocated as the `initial` and `extra` arrays, respectively. The latter are determined from the former.

The `md5sum` is used to verify the integrity of the configuration.

```
<Process libraries: public>+≡
    public :: process_def_t
<Process libraries: types>+≡
    type :: process_def_t
        private
        type(string_t) :: id
        integer :: num_id = 0

end subroutine process_def_show

```

Initialize an entry (initialize the process definition inside). We allocate the 'initial' set of components. Extra components remain unallocated.

The model should be present as a pointer. This allows us to retrieve the model's MD5 sum. However, for various tests it is sufficient to have the name.

We create the basenames for the process components by appending a suffix which we increment for each component.

```

⟨Process libraries: process def: TBP⟩+≡

        def%model_name = model_name
    end subroutine process_def_set_model_name

```

Initialize an initial component. The particle content must be specified. The process core block is not (yet) allocated.

We assume that the particle arrays match the `n_in` and `n_out` values in size. The model is referred to by name; it is identified as an existing model later. The index `i` must refer to an existing element of the component array.

Data specific for the process core of a component are imported as the `core_def` argument. We should allocate an object of class `prc_core_def_t` with the appropriate specific type, fill it, and transfer it to the process component definition here. The allocation is moved, so the original allocated object is returned empty.

        do i = 1, def%n_extra
            call def%extra(i)%compute_md5sum (model)
            buffer = buffer // def%initial(i)%md5sum
        end do
        def%md5sum = md5sum (char (buffer))
    end subroutine process_def_compute_md5sum

```

Return the MD5 sum of the process or of a process component.

```

⟨Process libraries: process def: TBP⟩+≡
    procedure :: get_md5sum => process_def_get_md5sum
⟨Process libraries: procedures⟩+≡
    function process_def_get_md5sum (def, i_component) result (md5sum)
        class(process_def_t), intent(in) :: def
        integer, intent(in), optional :: i_component
        character(32) :: md5sum
        if (present (i_component)) then
            md5sum = def%initial(i_component)%md5sum
        else
            md5sum = def%md5sum
        end if
    end function process_def_get_md5sum

```

Return a pointer to the definition of a particular component (for test purposes).

```

⟨Process libraries: process def: TBP⟩+≡
    procedure :: get_core_def_ptr => process_def_get_core_def_ptr
⟨Process libraries: procedures⟩+≡
    function process_def_get_core_def_ptr (def, i_component) result (ptr)
        class(process_def_t), intent(in), target :: def
        integer, intent(in) :: i_component
        class(prc_core_def_t), pointer :: ptr
        ptr => def%initial(i_component)%get_core_def_ptr ()
    end function process_def_get_core_def_ptr

```

This query tells whether a specific process component relies on external code. This includes all traditional WHIZARD matrix elements which rely on O'MEGA for code generation. Other process components (trivial decays, subtraction terms) do not require external code.

NOTE: Implemented only for initial component.

The query is passed to the process component.

```

⟨Process libraries: process def: TBP⟩+≡

```

```

procedure :: needs_code => process_def_needs_code
⟨Process libraries: procedures⟩+≡
    function process_def_needs_code (def, i_component) result (flag)
        class(process_def_t), intent(in) :: def
        integer, intent(in) :: i_component
        logical :: flag
        flag = def%initial(i_component)%needs_code ()
    end function process_def_needs_code

```

### Process definition list

A list of process definitions is the starting point for creating a process library. The list is built when reading the user input. When reading an existing process library, the list is used for cross-checking and updating the configuration.

We need a type for the list entry. The simplest way is to extend the process definition type, so all methods apply to the process definition directly.

```

⟨Process libraries: public⟩+≡
    public :: process_def_entry_t
⟨Process libraries: types⟩+≡
    type, extends (process_def_t) :: process_def_entry_t
        private
        type(process_def_entry_t), pointer :: next => null ()
    end type process_def_entry_t

```

This is the type for the list itself.

```

⟨Process libraries: public⟩+≡
    public :: process_def_list_t
⟨Process libraries: types⟩+≡
    type :: process_def_list_t
        private
        type(process_def_entry_t), pointer :: first => null ()
        type(process_def_entry_t), pointer :: last => null ()
        contains
            ⟨Process libraries: process def list: TBP⟩
    end type process_def_list_t

```

The deallocates the list iteratively. We assume that the list entries do not need finalization themselves.

```

⟨Process libraries: process def list: TBP⟩≡
    procedure :: final => process_def_list_final
⟨Process libraries: procedures⟩+≡
    subroutine process_def_list_final (list)
        class(process_def_list_t), intent(inout) :: list
        type(process_def_entry_t), pointer :: current
        nullify (list%last)
        do while (associated (list%first))
            current => list%first
            list%first => current%next
            deallocate (current)

```

```

    end do
end subroutine process_def_list_final
```

Write the complete list.

```

<Process libraries: process def list: TBP>+≡
    procedure :: write => process_def_list_write
<Process libraries: procedures>+≡
    subroutine process_def_list_write (object, unit, libpath)
        class(process_def_list_t), intent(in) :: object
        integer, intent(in), optional :: unit
        logical, intent(in), optional :: libpath
        type(process_def_entry_t), pointer :: entry
        integer :: i, u
        u = given_output_unit (unit)
        if (associated (object%first)) then
            i = 1
            entry => object%first
            do while (associated (entry))
                write (u, "(1x,A,I0,A)") "Process #", i, ":"
                call entry%write (u)
                i = i + 1
                entry => entry%next
                if (associated (entry)) write (u, *)
            end do
        else
            write (u, "(1x,A)") "Process definition list: [empty]"
        end if
    end subroutine process_def_list_write
```

Short account.

```

<Process libraries: process def list: TBP>+≡
    procedure :: show => process_def_list_show
<Process libraries: procedures>+≡
    subroutine process_def_list_show (object, unit)
        class(process_def_list_t), intent(in) :: object
        integer, intent(in), optional :: unit
        type(process_def_entry_t), pointer :: entry
        integer :: u
        u = given_output_unit (unit)
        if (associated (object%first)) then
            write (u, "(2x,A)") "Processes:"
            entry => object%first
            do while (associated (entry))
                call entry%show (u)
                entry => entry%next
            end do
        else
            write (u, "(2x,A)") "Processes: [empty]"
        end if
    end subroutine process_def_list_show
```

Read the complete list. We need an array of templates for the component sub-objects of abstract `prc_core_t` type, to allocate them with the correct specific type.

NOTE: Error handling is missing. Reading will just be aborted on error, or an I/O error occurs.

```
(Process libraries: process def list: TBP)+≡
procedure :: read => process_def_list_read
(Process libraries: procedures)+≡
subroutine process_def_list_read (object, unit, core_def_templates)
  class(process_def_list_t), intent(out) :: object
  integer, intent(in) :: unit
  type(prc_template_t), dimension(:), intent(in) :: core_def_templates
  type(process_def_entry_t), pointer :: entry
  character(80) :: buffer, ref
  integer :: i
  read (unit, "(A)") buffer
  write (ref, "(1x,A)") "Process definition list: [empty]"
  if (buffer == ref) return ! OK: empty library
  backspace (unit)
  READ_ENTRIES: do i = 1, huge (0)
    if (i > 1) read (unit, *, end=1)
    read (unit, "(A)") buffer

    write (ref, "(1x,A,I0,A)") "Process #", i, ":"
    if (buffer /= ref) return ! Wrong process header: done.
    allocate (entry)
    call entry%read (unit, core_def_templates)
    call object%append (entry)
  end do READ_ENTRIES
  1 continue ! EOF: done
end subroutine process_def_list_read
```

Append an entry to the list. The entry should be allocated as a pointer, and the pointer allocation is transferred. The original pointer is returned null.

```
(Process libraries: process def list: TBP)+≡
procedure :: append => process_def_list_append
(Process libraries: procedures)+≡
subroutine process_def_list_append (list, entry)
  class(process_def_list_t), intent(inout) :: list
  type(process_def_entry_t), intent(inout), pointer :: entry
  if (list%contains (entry%id)) then
    call msg_fatal ("Recording process: '" // char (entry%id) &
                  // "' has already been defined")
  end if
  if (associated (list%first)) then
    list%last%next => entry
  else
    list%first => entry
  end if
  list%last => entry
  entry => null ()
end subroutine process_def_list_append
```

### Probe the process definition list

Return the number of processes supported by the library.

```
<Process libraries: process def list: TBP>+≡
    procedure :: get_n_processes => process_def_list_get_n_processes
<Process libraries: procedures>+≡
    function process_def_list_get_n_processes (list) result (n)
        integer :: n
        class(process_def_list_t), intent(in) :: list
        type(process_def_entry_t), pointer :: current
        n = 0
        current => list%first
        do while (associated (current))
            n = n + 1
            current => current%next
        end do
    end function process_def_list_get_n_processes
```

Allocate an array with the process IDs supported by the library.

```
<Process libraries: process def list: TBP>+≡
    procedure :: get_process_id_list => process_def_list_get_process_id_list
<Process libraries: procedures>+≡
    subroutine process_def_list_get_process_id_list (list, id)
        class(process_def_list_t), intent(in) :: list
        type(string_t), dimension(:), allocatable, intent(out) :: id
        type(process_def_entry_t), pointer :: current
        integer :: i
        allocate (id (list%get_n_processes ()))
        i = 0
        current => list%first
        do while (associated (current))
            i = i + 1
            id(i) = current%id
            current => current%next
        end do
    end subroutine process_def_list_get_process_id_list
```

Return true if a given process is in the library.

```
<Process libraries: process def list: TBP>+≡
    procedure :: contains => process_def_list_contains
<Process libraries: procedures>+≡
    function process_def_list_contains (list, id) result (flag)
        logical :: flag
        class(process_def_list_t), intent(in) :: list
        type(string_t), intent(in) :: id
        type(process_def_entry_t), pointer :: current
        current => list%first
        do while (associated (current))
            if (id == current%id) then
```

```

        flag = .true.;  return
    end if
    current => current%next
end do
flag = .false.
end function process_def_list_contains
```

Return the index of the entry that corresponds to a given process.

*(Process libraries: process def list: TBP)*+≡

```

procedure :: get_entry_index => process_def_list_get_entry_index

function process_def_list_get_entry_index (list, id) result (n)
    integer :: n
    class(process_def_list_t), intent(in) :: list
    type(string_t), intent(in) :: id
    type(process_def_entry_t), pointer :: current
    n = 0
    current => list%first
    do while (associated (current))
        n = n + 1
        if (id == current%id) then
            return
        end if
        current => current%next
    end do
    n = 0
end function process_def_list_get_entry_index
```

Return the numerical ID for a process.

*(Process libraries: process def list: TBP)*+≡

```

procedure :: get_num_id => process_def_list_get_num_id

function process_def_list_get_num_id (list, id) result (num_id)
    integer :: num_id
    class(process_def_list_t), intent(in) :: list
    type(string_t), intent(in) :: id
    type(process_def_entry_t), pointer :: current
    current => list%first
    do while (associated (current))
        if (id == current%id) then
            num_id = current%num_id
            return
        end if
        current => current%next
    end do
    num_id = 0
end function process_def_list_get_num_id
```

Return the model name for a given process in the library.

*(Process libraries: process def list: TBP)*+≡

```

procedure :: get_model_name => process_def_list_get_model_name
```

```

⟨Process libraries: procedures⟩+≡
    function process_def_list_get_model_name (list, id) result (model_name)
        type(string_t) :: model_name
        class(process_def_list_t), intent(in) :: list
        type(string_t), intent(in) :: id
        type(process_def_entry_t), pointer :: current
        current => list%first
        do while (associated (current))
            if (id == current%id) then
                model_name = current%model_name
                return
            end if
            current => current%next
        end do
        model_name = ""
    end function process_def_list_get_model_name

```

Return the number of incoming particles of a given process in the library. This tells us whether the process is a decay or a scattering.

```

⟨Process libraries: process def list: TBP⟩+≡
    procedure :: get_n_in => process_def_list_get_n_in
⟨Process libraries: procedures⟩+≡
    function process_def_list_get_n_in (list, id) result (n)
        integer :: n
        class(process_def_list_t), intent(in) :: list
        type(string_t), intent(in) :: id
        type(process_def_entry_t), pointer :: current
        current => list%first
        do while (associated (current))
            if (id == current%id) then
                n = current%n_in
                return
            end if
            current => current%next
        end do
    end function process_def_list_get_n_in

```

Return the number of components of a given process in the library.

```

⟨Process libraries: process def list: TBP⟩+≡
    procedure :: get_n_components => process_def_list_get_n_components
⟨Process libraries: procedures⟩+≡
    function process_def_list_get_n_components (list, id) result (n)
        integer :: n
        class(process_def_list_t), intent(in) :: list
        type(string_t), intent(in) :: id

        end if
        current => current%next
    end do
end function process_def_list_get_nlo_process
```

### 13.4.3 Process library

The process library object is the interface between the process definition data, as provided by the user, generated or linked process code on file, and the process run data that reference the process code.

#### Process library entry

For each process component that is part of the library, there is a separate library entry (`process_library_entry_t`). The library entry connects a process definition with the specific code (if any) in the compiled driver library.

The `status` indicates how far the process has been processed by the system (definition, code generation, compilation, linking). A process with status `STAT_LOADED` is accessible for computing matrix elements.

The `def` pointer identifies the corresponding process definition. The process component within that definition is identified by the `i_component` index.

The `i_external` index refers to the compiled library driver. If it is zero, there is no associated matrix-element code.

The `driver` component holds the pointers to the matrix-element specific functions, in particular the matrix element function itself.

```
(Process libraries: types)+≡
type :: process_library_entry_t
    private
        integer :: status = STAT_UNKNOWN
        type(process_def_t), pointer :: def => null()
        integer :: i_component = 0
        integer :: i_external = 0
        class(prc_core_driver_t), allocatable :: driver
    contains
        <Process libraries: process library entry: TBP>
end type process_library_entry_t
```

Here are the available status codes. An entry starts with UNKNOWN status. Once the association with a valid process definition is established, the status becomes CONFIGURED. If matrix element source code is to be generated by the system or provided from elsewhere, CODE\_GENERATED indicates that this is done. The COMPILED status is next, it also applies to processes which are accessed as pre-compiled binaries. Finally, the library is linked and process pointers are set; this is marked as LOADED.

For a process library, the initial status is OPEN, since process definitions may be added. After configuration, the process content is fixed and the status becomes CONFIGURED. The further states are as above, always referring to the lowest status among the process entries.

```
(Process libraries: parameters)≡
integer, parameter, public :: STAT_UNKNOWN = 0
integer, parameter, public :: STAT_OPEN = 1
integer, parameter, public :: STAT_CONFIGURED = 2
integer, parameter, public :: STAT_SOURCE = 3
integer, parameter, public :: STAT_COMPILED = 4
integer, parameter, public :: STAT_LINKED = 5
integer, parameter, public :: STAT_ACTIVE = 6
```

```

integer, parameter, public :: ASSOCIATED_BORN = 1
integer, parameter, public :: ASSOCIATED_REAL = 2
integer, parameter, public :: ASSOCIATED_VIRT = 3
integer, parameter, public :: ASSOCIATED_SUB = 4
integer, parameter, public :: ASSOCIATED_PDF = 5
integer, parameter, public :: ASSOCIATED_REAL_SING = 6
integer, parameter, public :: ASSOCIATED_REAL_FIN = 7
integer, parameter, public :: N_ASSOCIATED_COMPONENTS = 7

```

These are the associated code letters, for output:

```

⟨Process libraries: parameters⟩+≡
    character, dimension(0:6), parameter :: STATUS_LETTER = &
        ["?", "o", "f", "s", "c", "l", "a"]

```

This produces a condensed account of the library entry. The status is indicated by a letter in brackets, then the ID and component index of the associated process definition, finally the library index, if available.

```

⟨Process libraries: process library entry: TBP⟩≡
    procedure :: to_string => process_library_entry_to_string

⟨Process libraries: procedures⟩+≡
    function process_library_entry_to_string (object) result (string)
        type(string_t) :: string

    call entry%def%initial(entry%i_component)%connect &
        (lib_driver, i, entry%driver)
end subroutine process_library_entry_connect

```

## The process library object

The `process_library_t` type is an extension of the `process_def_list_t` type. Thus, it automatically contains the process definition list.

The `basename` identifies the library generically.

The `external` flag is true if any process within the library needs external code, so the library must correspond to an actual code library (statically or dynamically linked).

The `entry` array contains all process components that can be handled by this library. Each entry refers to the process (component) definition and to the associated external matrix element code, if there is any.

The `driver` object is needed only if `external` is true. This object handles all interactions with external matrix-element code.

The `md5sum` summarizes the complete `process_def_list_t` base object. It can be used to check if the library configuration has changed.

```

<Process libraries: public>+≡
public :: process_library_t

```

```

⟨Process libraries: types⟩+≡
  type, extends (process_def_list_t) :: process_library_t
    private
      type(string_t) :: basename
      integer :: n_entries = 0
      logical :: external = .false.
      integer :: status = STAT_UNKNOWN
      logical :: static = .false.
      logical :: driver_exists = .false.
      logical :: makefile_exists = .false.
      type(process_library_entry_t), dimension(:), allocatable :: entry

        lib%basename = basename
        lib%status = STAT_OPEN
        lib%static = .true.
        call msg_message ("Static process library '" // char (basename) &
                         // "' : initialized")
    end subroutine process_library_init_static

```

The `configure` procedure scans the allocated entries in the process definition list. The configuration proceeds in three passes.

In the first pass, we scan the process definition list and count the number of process components and the number of components which need external code. This is used to allocate the `entry` array.

In the second pass, we initialize the `entry` elements which connect process definitions, process driver objects, and external code.

In the third pass, we initialize the library driver object, allocating an entry for each external matrix element.

NOTE: Currently we handle only `initial` process components; `extra` components are ignored.

```

    close (unit)
end if
lib%driver_exists = .true.
end if
end subroutine process_library_write_driver

```

Update the compilation status of an external library.

Strictly speaking, this is not necessary for a one-time run, since the individual library methods will update the status themselves. However, it allows us to identify compilation steps that we can skip because the file exists or is already loaded, for the whole library or for particular entries.

Independently, the building process is controlled by a makefile. Thus, previous files are reused if they are not modified by the current compilation.

1. If it is not already loaded, attempt to load the library. If successful, check the overall MD5 sum. If it matches, just keep it loaded and mark as ACTIVE. If not, check the MD5 sum for all linked process components. Where it matches, mark the entry as COMPILED. Then, unload the library and mark as CONFIGURED.

Thus, we can identify compiled files for all matrix elements which are accessible via the previous compiled library, even if it is no longer up to date.

2. If the library is now in CONFIGURED state, look for valid source files. Each entry that is just in CONFIGURED state will advance to SOURCE if the MD5 sum matches. Finally, advance the whole library to SOURCE if all entries are at least in this condition.

```

<Process libraries: process library: TBP>+≡

        end if
    end if
end select
end if
end subroutine process_library_update_status

```

This procedure triggers code generation for all processes where this is possible.

We generate code only for external processes of status STAT\_CONFIGURED, which then advance to STAT\_SOURCE. If, for a particular process, the status is already advanced, we do not remove previous files, so `make` will consider them as up to date if they exist. Otherwise, we remove those files to force a fresh `make`.

Finally, if any source code has been generated, we need a driver file.

```

```

#### 13.4.4 Use the library

Return the base name of the library

```

⟨Process libraries: process library: TBP⟩+≡
procedure :: get_name => process_library_get_name
⟨Process libraries: procedures⟩+≡
function process_library_get_name (lib) result (name)
    class(process_library_t), intent(in) :: lib
    type(string_t) :: name
    name = lib%basename
end function process_library_get_name

```

Once activated, we view the process library object as an interface for accessing the matrix elements.

```
(Process libraries: process library: TBP)+≡
    procedure :: is_active => process_library_is_active
(Process libraries: procedures)+≡
    function process_library_is_active (lib) result (flag)
        logical :: flag
        class(process_library_t), intent(in) :: lib
        flag = lib%status == STAT_ACTIVE
    end function process_library_is_active
```

Return the current status code of the library. If an index is provided, return the status of that entry.

```
(Process libraries: process library: TBP)+≡
    procedure :: get_status => process_library_get_status
(Process libraries: procedures)+≡
    function process_library_get_status (lib, i) result (status)
        class(process_library_t), intent(in) :: lib
        integer, intent(in), optional :: i
        integer :: status
        if (present (i)) then
            status = lib%entry(i)%status
        else
            status = lib%status
        end if
    end function process_library_get_status
```

Manually set the current status code of the library. If the optional flag is set, set also the entry status codes. This is used for unit tests.

```
(Process libraries: process library: TBP)+≡
    procedure :: set_status => process_library_set_status
(Process libraries: procedures)+≡
    subroutine process_library_set_status (lib, status, entries)
        class(process_library_t), intent(inout) :: lib
        integer, intent(in) :: status
        logical, intent(in), optional :: entries
        lib%status = status
        if (present (entries)) then
            if (entries) lib%entry%status = status
        end if
    end subroutine process_library_set_status
```

Return the load status of the associated driver.

```
(Process libraries: process library: TBP)+≡
    procedure :: is_loaded => process_library_is_loaded
```

```

⟨Process libraries: procedures⟩+≡
    function process_library_is_loaded (lib) result (flag)
        class(process_library_t), intent(in) :: lib
        logical :: flag
        flag = lib%driver%loaded
    end function process_library_is_loaded

Retrieve constants using the process library driver. We assume that the process
code has been loaded, if external.

⟨Process libraries: process library entry: TBP⟩+≡

    call test (process_libraries_1, "process_libraries_1", &
    "empty process list", &
    u, results)

⟨Process libraries: test declarations⟩≡
    public :: process_libraries_1

⟨Process libraries: tests⟩≡
    subroutine process_libraries_1 (u)
        integer, intent(in) :: u
        type(process_def_list_t) :: process_def_list

        write (u, "(A)")    "* Test output: process_libraries_1"
        write (u, "(A)")    "* Purpose: Display an empty process definition list"
        write (u, "(A)")

        call process_def_list%write (u)

        write (u, "(A)")
        write (u, "(A)")    "* Test output end: process_libraries_1"
    end subroutine process_libraries_1

```

### Process definition list

Test 2: Process definition list with processes and components. Construct the list, write to file, read it in again, and display. Finalize and delete the list after use.

We define a trivial 'test' type for the process variant. The test type contains just one (meaningless) data item, which is an integer.

```

⟨Process libraries: test types⟩≡
    type, extends (prc_core_def_t) :: prcdef_2_t
        integer :: data = 0
        logical :: file = .false.
    contains
        ⟨Process libraries: prcdef 2: TBP⟩
    end type prcdef_2_t

```

The process variant is named 'test'.

```

⟨Process libraries: prcdef 2: TBP⟩≡
    procedure, nopass :: type_string => prcdef_2_type_string

⟨Process libraries: test auxiliary⟩≡
    function prcdef_2_type_string () result (string)
        type(string_t) :: string
        string = "test"
    end function prcdef_2_type_string

```

Write the contents (the integer value).

```

⟨Process libraries: prcdef 2: TBP⟩+≡
    procedure :: write => prcdef_2_write

```

```

⟨Process libraries: test auxiliary⟩+≡
    subroutine prcdef_2_write (object, unit)
        class(prcdef_2_t), intent(in) :: object
        integer, intent(in) :: unit
        write (unit, "(3x,A,I0)") "Test data" = ", object%data
    end subroutine prcdef_2_write

```

Recover the integer value.

```

⟨Process libraries: prcdef 2: TBP⟩+≡
    procedure :: read => prcdef_2_read
⟨Process libraries: test auxiliary⟩+≡
    subroutine prcdef_2_read (object, unit)
        class(prcdef_2_t), intent(out) :: object
        integer, intent(in) :: unit
        character(80) :: buffer
        read (unit, "(A)") buffer
        call strip_equation_lhs (buffer)
        read (buffer, *) object%data
    end subroutine prcdef_2_read

```

No external procedures.

```

⟨Process libraries: prcdef 2: TBP⟩+≡
    procedure, nopass :: get_features => prcdef_2_get_features
⟨Process libraries: test auxiliary⟩+≡
    subroutine prcdef_2_get_features (features)
        type(string_t), dimension(:), allocatable, intent(out) :: features
        allocate (features (0))
    end subroutine prcdef_2_get_features

```

No code generated.

```

⟨Process libraries: prcdef 2: TBP⟩+≡
    procedure :: generate_code => prcdef_2_generate_code
⟨Process libraries: test auxiliary⟩+≡
    subroutine prcdef_2_generate_code (object, &
        basename, model_name, prt_in, prt_out)
        class(prcdef_2_t), intent(in) :: object
        type(string_t), intent(in) :: basename
        type(string_t), intent(in) :: model_name
        type(string_t), dimension(:), intent(in) :: prt_in
        type(string_t), dimension(:), intent(in) :: prt_out
    end subroutine prcdef_2_generate_code

```

Allocate the driver with the appropriate type.

```

⟨Process libraries: prcdef 2: TBP⟩+≡
    procedure :: allocate_driver => prcdef_2_allocate_driver
⟨Process libraries: test auxiliary⟩+≡
    subroutine prcdef_2_allocate_driver (object, driver, basename)
        class(prcdef_2_t), intent(in) :: object
        class(prc_core_driver_t), intent(out), allocatable :: driver

```

```

type(string_t), intent(in) :: basename
allocate (prctest_2_t :: driver)
end subroutine prcdef_2_allocate_driver

```

Nothing to connect.

```

⟨Process libraries: prcdef 2: TBP⟩+≡
procedure :: connect => prcdef_2_connect
⟨Process libraries: test auxiliary⟩+≡
subroutine prcdef_2_connect (def, lib_driver, i, proc_driver)
  class(prcdef_2_t), intent(in) :: def
  class(prclib_driver_t), intent(in) :: lib_driver
  integer, intent(in) :: i
  class(prc_core_driver_t), intent(inout) :: proc_driver
end subroutine prcdef_2_connect

```

The associated driver type.

```

⟨Process libraries: test types⟩+≡
type, extends (process_driver_internal_t) :: prctest_2_t
contains
⟨Process libraries: prctest 2: TBP⟩
end type prctest_2_t

```

Return the type name.

```

⟨Process libraries: prctest 2: TBP⟩≡
procedure, nopass :: type_name => prctest_2_type_name
⟨Process libraries: test auxiliary⟩+≡
function prctest_2_type_name () result (type)
  type(string_t) :: type
  type = "test"
end function prctest_2_type_name

```

This should fill constant process data. We do not check those here, however, therefore nothing done.

```

⟨Process libraries: prctest 2: TBP⟩+≡
procedure :: fill_constants => prctest_2_fill_constants
⟨Process libraries: test auxiliary⟩+≡
subroutine prctest_2_fill_constants (driver, data)
  class(prctest_2_t), intent(in) :: driver
  type(process_constants_t), intent(out) :: data
end subroutine prctest_2_fill_constants

```

Here is the actual test.

For reading, we need a list of templates, i.e., an array containing allocated objects for all available process variants. This is the purpose of `process_core_templates`. Here, we have only a single template for the 'test' variant.

```

⟨Process libraries: execute tests⟩+≡
call test (process_libraries_2, "process_libraries_2", &
           "process definition list", &
           u, results)

```

```

```

### Build workflow for test matrix element

Test 5: We write source code for a dummy process.

We define another trivial type for the process variant. The test type contains just no variable data, but produces code on file.

```

⟨Process libraries: test types⟩+≡
  type, extends (prc_core_def_t) :: prcdef_5_t
  contains
    ⟨Process libraries: prcdef 5: TBP⟩
  end type prcdef_5_t

```

The process variant is named `test_file`.

```

⟨Process libraries: prcdef 5: TBP⟩≡
  procedure, nopass :: type_string => prcdef_5_type_string

⟨Process libraries: test auxiliary⟩+≡
  function prcdef_5_type_string () result (string)
    type(string_t) :: string
    string = "test_file"
  end function prcdef_5_type_string

```

We reuse the writer `test_writer_4` from the previous module.

```

⟨Process libraries: prcdef 5: TBP⟩+≡
  procedure :: init => prcdef_5_init

⟨Process libraries: test auxiliary⟩+≡
  subroutine prcdef_5_init (object)
    class(prcdef_5_t), intent(out) :: object
    allocate (test_writer_4_t :: object%writer)
  end subroutine prcdef_5_init

```

Nothing to write.

```

⟨Process libraries: prcdef 5: TBP⟩+≡
  procedure :: write => prcdef_5_write

```

```

⟨Process libraries: test auxiliary⟩+≡
    subroutine prcdef_5_write (object, unit)
        class(prcdef_5_t), intent(in) :: object
        integer, intent(in) :: unit
    end subroutine prcdef_5_write

```

Nothing to read.

```

⟨Process libraries: prcdef 5: TBP⟩+≡
    procedure :: read => prcdef_5_read
⟨Process libraries: test auxiliary⟩+≡
    subroutine prcdef_5_read (object, unit)
        class(prcdef_5_t), intent(out) :: object
        integer, intent(in) :: unit
    end subroutine prcdef_5_read

```

Allocate the driver with the appropriate type.

```

⟨Process libraries: prcdef 5: TBP⟩+≡
    procedure :: allocate_driver => prcdef_5_allocate_driver
⟨Process libraries: test auxiliary⟩+≡
    subroutine prcdef_5_allocate_driver (object, driver, basename)
        class(prcdef_5_t), intent(in) :: object
        class(prc_core_driver_t), intent(out), allocatable :: driver
        type(string_t), intent(in) :: basename
        allocate (prctest_5_t :: driver)
    end subroutine prcdef_5_allocate_driver

```

This time we need code:

```

⟨Process libraries: prcdef 5: TBP⟩+≡
    procedure, nopass :: needs_code => prcdef_5_needs_code
⟨Process libraries: test auxiliary⟩+≡
    function prcdef_5_needs_code () result (flag)
        logical :: flag
        flag = .true.
    end function prcdef_5_needs_code

```

For the test case, we implement a single feature proc1.

```

⟨Process libraries: prcdef 5: TBP⟩+≡
    procedure, nopass :: get_features => prcdef_5_get_features
⟨Process libraries: test auxiliary⟩+≡
    subroutine prcdef_5_get_features (features)
        type(string_t), dimension(:), allocatable, intent(out) :: features
        allocate (features (1))
        features = [ var_str ("proc1") ]
    end subroutine prcdef_5_get_features

```

Nothing to connect.

```

⟨Process libraries: prcdef 5: TBP⟩+≡
    procedure :: connect => prcdef_5_connect

```

```

⟨Process libraries: test auxiliary⟩+≡
    subroutine prcdef_5_connect (def, lib_driver, i, proc_driver)
        class(prcdef_5_t), intent(in) :: def
        class(prclib_driver_t), intent(in) :: lib_driver
        integer, intent(in) :: i
        class(prc_core_driver_t), intent(inout) :: proc_driver
    end subroutine prcdef_5_connect

```

The driver type.

```

⟨Process libraries: test types⟩+≡
    type, extends (prc_core_driver_t) :: prctest_5_t
        contains
            ⟨Process libraries: prctest 5: TBP⟩
    end type prctest_5_t

```

Return the type name.

```

⟨Process libraries: prctest 5: TBP⟩≡
    procedure, nopass :: type_name => prctest_5_type_name
⟨Process libraries: test auxiliary⟩+≡
    function prctest_5_type_name () result (type)
        type(string_t) :: type
        type = "test_file"
    end function prctest_5_type_name

```

Here is the actual test:

```

⟨Process libraries: execute tests⟩+≡
    call test (process_libraries_5, "process_libraries_5", &
               "build external process library", &

```

## Build and load library with test matrix element

Test 6: We write source code for a dummy process.

This process variant is identical to the previous case, but it supports a driver for the test procedure 'proc1'.

```
<Process libraries: test types>+≡
    type, extends (prc_core_def_t) :: prcdef_6_t
        contains
            <Process libraries: prcdef 6: TBP>
    end type prcdef_6_t
```

The process variant is named `test_file`.

```
<Process libraries: prcdef 6: TBP>≡
    procedure, nopass :: type_string => prcdef_6_type_string
<Process libraries: test auxiliary>+≡
    function prcdef_6_type_string () result (string)
        type(string_t) :: string
        string = "test_file"
    end function prcdef_6_type_string
```

We reuse the writer `test_writer_4` from the previous module.

```
<Process libraries: prcdef 6: TBP>+≡
    procedure :: init => prcdef_6_init
<Process libraries: test auxiliary>+≡
    subroutine prcdef_6_init (object)
        class(prcdef_6_t), intent(out) :: object
        allocate (test_writer_4_t :: object%writer)
        call object%writer%init_test ()
    end subroutine prcdef_6_init
```

Nothing to write.

```
<Process libraries: prcdef 6: TBP>+≡
    procedure :: write => prcdef_6_write
<Process libraries: test auxiliary>+≡
    subroutine prcdef_6_write (object, unit)
        class(prcdef_6_t), intent(in) :: object
        integer, intent(in) :: unit
    end subroutine prcdef_6_write
```

Nothing to read.

```
<Process libraries: prcdef 6: TBP>+≡
    procedure :: read => prcdef_6_read
<Process libraries: test auxiliary>+≡
    subroutine prcdef_6_read (object, unit)
        class(prcdef_6_t), intent(out) :: object
        integer, intent(in) :: unit
    end subroutine prcdef_6_read
```

Allocate the driver with the appropriate type.

```
(Process libraries: prcdef 6: TBP)+≡
    procedure :: allocate_driver => prcdef_6_allocate_driver
(Process libraries: test auxiliary)+≡
    subroutine prcdef_6_allocate_driver (object, driver, basename)
        class(prcdef_6_t), intent(in) :: object
        class(prc_core_driver_t), intent(out), allocatable :: driver
        type(string_t), intent(in) :: basename
        allocate (prctest_6_t :: driver)
    end subroutine prcdef_6_allocate_driver
```

This time we need code:

```
(Process libraries: prcdef 6: TBP)+≡
    procedure, nopass :: needs_code => prcdef_6_needs_code
(Process libraries: test auxiliary)+≡
    function prcdef_6_needs_code () result (flag)
        logical :: flag
        flag = .true.
    end function prcdef_6_needs_code
```

For the test case, we implement a single feature proc1.

```
(Process libraries: prcdef 6: TBP)+≡
    procedure, nopass :: get_features => prcdef_6_get_features
(Process libraries: test auxiliary)+≡
    subroutine prcdef_6_get_features (features)
        type(string_t), dimension(:), allocatable, intent(out) :: features
        allocate (features (1))
        features = [ var_str ("proc1") ]
    end subroutine prcdef_6_get_features
```

The interface of the only specific feature.

```
(Process libraries: test types)+≡
    abstract interface
        subroutine proc1_t (n) bind(C)
            import
            integer(c_int), intent(out) :: n
        end subroutine proc1_t
    end interface
```

Connect the feature proc1 with the process driver.

```
(Process libraries: prcdef 6: TBP)+≡
    procedure :: connect => prcdef_6_connect
(Process libraries: test auxiliary)+≡
    subroutine prcdef_6_connect (def, lib_driver, i, proc_driver)
        class(prcdef_6_t), intent(in) :: def
        class(prclib_driver_t), intent(in) :: lib_driver
        integer, intent(in) :: i
        class(prc_core_driver_t), intent(inout) :: proc_driver
        integer(c_int) :: pid, fid
```

```

type(c_funptr) :: fptra
select type (proc_driver)
type is (prctest_6_t)
    pid = i
    fid = 1
    call lib_driver%get_fptr (pid, fid, fptra)
    call c_f_procpointer (fptra, proc_driver%proc1)
end select
end subroutine prcdef_6_connect

```

The driver type.

```

<Process libraries: test types>+≡
type, extends (prc_core_driver_t) :: prctest_6_t
    procedure(proc1_t), nopass, pointer :: proc1 => null ()
contains
    <Process libraries: prctest 6: TBP>
end type prctest_6_t

```

Return the type name.

```

<Process libraries: prctest 6: TBP>≡
procedure, nopass :: type_name => prctest_6_type_name
<Process libraries: test auxiliary>+≡
function prctest_6_type_name () result (type)
    type(string_t) :: type
    type = "test_file"
end function prctest_6_type_name

```

Here is the actual test:

```

write (u, "(A)") "* Test output end: process_libraries_8"
end subroutine process_libraries_8

```

## 13.5 Process Library Stacks

For storing and handling multiple libraries, we define process library stacks. These are ordinary stacks where new entries are pushed onto the top.

```

⟨prclib_stacks.f90⟩≡
⟨File header⟩

module prclib_stacks

⟨Use strings⟩
use io_units
use format_utils, only: write_separator
use process_libraries

⟨Standard module head⟩

⟨Prclib stacks: public⟩

⟨Prclib stacks: types⟩

contains

⟨Prclib stacks: procedures⟩

end module prclib_stacks

```

### 13.5.1 The stack entry type

A stack entry is a process library object, augmented by a pointer to the next entry. We do not need specific methods, all relevant methods are inherited.

On higher level, process libraries should be prepared as process entry objects.

```
<Prelib stacks: public>≡  
    public :: prclib_entry_t  
  
<Prelib stacks: types>≡  
    type, extends (process_library_t) :: prclib_entry_t  
        type(prclib_entry_t), pointer :: next => null ()  
    end type prclib_entry_t
```

### 13.5.2 The prclib stack type

For easy conversion and lookup it is useful to store the filling number in the object. The content is stored as a linked list.

```
<Prelib stacks: public>+≡  
    public :: prclib_stack_t  
  
<Prelib stacks: types>+≡  
    type :: prclib_stack_t  
        integer :: n = 0  
        type(prclib_entry_t), pointer :: first => null ()  
        contains  
            <Prelib stacks: prclib stack: TBP>  
        end type prclib_stack_t
```

Finalizer. Iteratively deallocate the stack entries. The resulting empty stack can be immediately recycled, if necessary.

```
<Prelib stacks: prclib stack: TBP>≡  
    procedure :: final => prclib_stack_final  
  
<Prelib stacks: procedures>≡  
    subroutine prclib_stack_final (object)  
        class(prclib_stack_t), intent(inout) :: object  
        type(prclib_entry_t), pointer :: lib  
        do while (associated (object%first))  
            lib => object%first  
            object%first => lib%next  
            call lib%final ()  
            deallocate (lib)  
        end do  
        object%n = 0  
    end subroutine prclib_stack_final
```

Output. The entries on the stack will be ordered LIFO, i.e., backwards.

```
<Prelib stacks: prclib stack: TBP>+≡  
    procedure :: write => prclib_stack_write
```

```

⟨Prelib stacks: procedures⟩+≡
    subroutine prclib_stack_write (object, unit, libpath)
        class(prclib_stack_t), intent(in) :: object
        integer, intent(in), optional :: unit
        logical, intent(in), optional :: libpath
        type(prclib_entry_t), pointer :: lib
        integer :: u
        u = given_output_unit (unit)
        call write_separator (u, 2)
        select case (object%n)
        case (0)
            write (u, "(1x,A)") "Process library stack: [empty]"
        case default
            write (u, "(1x,A)") "Process library stack:"
            lib => object%first
            do while (associated (lib))
                call write_separator (u)
                call lib%write (u, libpath)
                lib => lib%next
            end do
        end select
        call write_separator (u, 2)
    end subroutine prclib_stack_write

```

### 13.5.3 Operating on Stacks

We take a library entry pointer and push it onto the stack. The previous pointer is nullified. Subsequently, the library entry is ‘owned’ by the stack and will be finalized when the stack is deleted.

```

⟨Prelib stacks: prclib stack: TBP⟩+≡
    procedure :: push => prclib_stack_push

⟨Prelib stacks: procedures⟩+≡
    subroutine prclib_stack_push (stack, lib)
        class(prclib_stack_t), intent(inout) :: stack
        type(prclib_entry_t), intent(inout), pointer :: lib
        lib%next => stack%first
        stack%first => lib
        lib => null ()
        stack%n = stack%n + 1
    end subroutine prclib_stack_push

```

### 13.5.4 Accessing Contents

Return a pointer to the topmost stack element. The result type is just the bare `process_library_t`. There is no `target` attribute required since the stack elements are allocated via pointers.

```

⟨Prelib stacks: prclib stack: TBP⟩+≡
    procedure :: get_first_ptr => prclib_stack_get_first_ptr

```

```

⟨Prclib stacks: procedures⟩+≡
    function prclib_stack_get_first_ptr (stack) result (ptr)
        class(prclib_stack_t), intent(in) :: stack
        type(process_library_t), pointer :: ptr
        if (associated (stack%first)) then
            ptr => stack%first%process_library_t
        else
            ptr => null ()
        end if
    end function prclib_stack_get_first_ptr

```

Return a complete list of the libraries (names) in the stack. The list is in the order in which the elements got pushed onto the stack, so the 'first' entry is listed last.

```

⟨Prclib stacks: prclib stack: TBP⟩+≡
    procedure :: get_names => prclib_stack_get_names
⟨Prclib stacks: procedures⟩+≡
    subroutine prclib_stack_get_names (stack, libname)
        class(prclib_stack_t), intent(in) :: stack
        type(string_t), dimension(:), allocatable, intent(out) :: libname
        type(prclib_entry_t), pointer :: lib
        integer :: i
        allocate (libname (stack%n))
        i = stack%n
        lib => stack%first
        do while (associated (lib))
            libname(i) = lib%get_name ()
            i = i - 1
            lib => lib%next
        end do
    end subroutine prclib_stack_get_names

```

Return a pointer to the library with given name.

```

⟨Prclib stacks: prclib stack: TBP⟩+≡
    procedure :: get_library_ptr => prclib_stack_get_library_ptr
⟨Prclib stacks: procedures⟩+≡
    function prclib_stack_get_library_ptr (stack, libname) result (ptr)
        class(prclib_stack_t), intent(in) :: stack
        type(string_t), intent(in) :: libname
        type(process_library_t), pointer :: ptr
        type(prclib_entry_t), pointer :: current
        current => stack%first
        do while (associated (current))
            if (current%get_name () == libname) then
                ptr => current%process_library_t
                return
            end if
            current => current%next
        end do
        ptr => null ()
    end function prclib_stack_get_library_ptr

```

### 13.5.5 Unit tests

Test module, followed by the corresponding implementation module.

```
⟨prclib_stacks_ut.f90⟩≡
  ⟨File header⟩

  module prclib_stacks_ut
    use unit_tests
    use prclib_stacks_uti

    ⟨Standard module head⟩

    ⟨Prclib stacks: public test⟩

    contains

    ⟨Prclib stacks: test driver⟩

    end module prclib_stacks_ut

⟨prclib_stacks_uti.f90⟩≡
  ⟨File header⟩

  module prclib_stacks_uti
    ⟨Use strings⟩

    use prclib_stacks

    ⟨Standard module head⟩

    ⟨Prclib stacks: test declarations⟩

    contains

    ⟨Prclib stacks: tests⟩

    end module prclib_stacks_uti
API: driver for the unit tests below.
⟨Prclib stacks: public test⟩≡
  public :: prclib_stacks_test
⟨Prclib stacks: test driver⟩≡
  subroutine prclib_stacks_test (u, results)
    integer, intent(in) :: u
    type(test_results_t), intent(inout) :: results
  ⟨Prclib stacks: execute tests⟩
  end subroutine prclib_stacks_test
```

#### Write an empty process library stack

The most trivial test is to write an uninitialized process library stack.

```
⟨Prclib stacks: execute tests⟩≡
```

```

call test (prclib_stacks_1, "prclib_stacks_1", &
           "write an empty process library stack", &
           u, results)
⟨Prclib stacks: test declarations⟩≡
    public :: prclib_stacks_1
⟨Prclib stacks: tests⟩≡
    subroutine prclib_stacks_1 (u)
        integer, intent(in) :: u
        type(prclib_stack_t) :: stack

        write (u, "(A)")    /* Test output: prclib_stacks_1*/
        write (u, "(A)")    /* Purpose: display an empty process library stack*/
        write (u, "(A)")

        call stack%write (u)

        write (u, "(A)")
        write (u, "(A)")    /* Test output end: prclib_stacks_1*/

    end subroutine prclib_stacks_1

```

### Fill a process library stack

Fill a process library stack with two (identical) processes.

```

⟨Prclib stacks: execute tests⟩+≡
    call test (prclib_stacks_2, "prclib_stacks_2", &
               "fill a process library stack", &
               u, results)
⟨Prclib stacks: test declarations⟩+≡
    public :: prclib_stacks_2
⟨Prclib stacks: tests⟩+≡
    subroutine prclib_stacks_2 (u)
        integer, intent(in) :: u
        type(prclib_stack_t) :: stack
        type(prclib_entry_t), pointer :: lib

        write (u, "(A)")    /* Test output: prclib_stacks_2*/
        write (u, "(A)")    /* Purpose: fill a process library stack*/
        write (u, "(A)")

        write (u, "(A)")    /* Initialize two (empty) libraries &
                               &and push them on the stack*/
        write (u, "(A)")

        allocate (lib)
        call lib%init (var_str ("lib1"))
        call stack%push (lib)

        allocate (lib)
        call lib%init (var_str ("lib2"))
        call stack%push (lib)

```

```

call stack%write (u)

write (u, "(A)")
write (u, "(A)")  "* Cleanup"

call stack%final ()

write (u, "(A)")
write (u, "(A)")  "* Test output end: prclib_stacks_2"

end subroutine prclib_stacks_2

```

## 13.6 Trivial matrix element for tests

For the purpose of testing the workflow, we implement here two matrix elements with the simplest possible structure.

This matrix element generator can only generate a single scattering process and a single decay process. The scattering process is a quartic interaction of a massless, neutral and colorless scalar  $s$  with unit coupling results in a trivial  $2 \rightarrow 2$  scattering process. The matrix element is implemented internally, so we do not need the machinery of external process libraries. The decay process is a decay of  $s$  into a pair of colored fermions  $f$ .

```

<prc_test.f90>≡
  <File header>

  module prc_test

    use, intrinsic :: iso_c_binding !NODEP!

  <Use kinds>
  <Use strings>
    use os_interface
    use process_constants
    use prclib_interfaces
    use prc_core_def
    use particle_specifiers, only: new_prt_spec
    use process_libraries

  <Standard module head>

  <Test ME: public>

  <Test ME: types>

  contains

  <Test ME: procedures>

  end module prc_test

```

### 13.6.1 Process definition

For the process definition we implement an extension of the `prc_core_def_t` abstract type.

```

⟨Test ME: public⟩≡
  public :: prc_test_def_t

⟨Test ME: types⟩≡
  type, extends (prc_core_def_t) :: prc_test_def_t
    type(string_t) :: model_name
    type(string_t), dimension(:), allocatable :: prt_in
    type(string_t), dimension(:), allocatable :: prt_out
    contains
      ⟨Test ME: test me def: TBP⟩
    end type prc_test_def_t

⟨Test ME: test me def: TBP⟩≡
  procedure, nopass :: type_string => prc_test_def_type_string

⟨Test ME: procedures⟩≡
  function prc_test_def_type_string () result (string)
    type(string_t) :: string
    string = "test_me"
  end function prc_test_def_type_string

```

There is no 'feature' here since there is no external code.

```

⟨Test ME: test me def: TBP⟩+≡
  procedure, nopass :: get_features => prc_test_def_get_features

⟨Test ME: procedures⟩+≡
  subroutine prc_test_def_get_features (features)
    type(string_t), dimension(:), allocatable, intent(out) :: features
    allocate (features (0))
  end subroutine prc_test_def_get_features

```

Initialization: set some data (not really useful).

```

⟨Test ME: test me def: TBP⟩+≡
  procedure :: init => prc_test_def_init

⟨Test ME: procedures⟩+≡
  subroutine prc_test_def_init (object, model_name, prt_in, prt_out)
    class(prc_test_def_t), intent(out) :: object
    type(string_t), intent(in) :: model_name
    type(string_t), dimension(:), intent(in) :: prt_in
    type(string_t), dimension(:), intent(in) :: prt_out
    object%model_name = model_name
    allocate (object%prt_in (size (prt_in)))
    object%prt_in = prt_in
    allocate (object%prt_out (size (prt_out)))
    object%prt_out = prt_out
  end subroutine prc_test_def_init

```

Write/read process- and method-specific data. (No-op)

```

⟨Test ME: test me def: TBP⟩+≡
  procedure :: write => prc_test_def_write

```

```

⟨Test ME: procedures⟩+≡
    subroutine prc_test_def_write (object, unit)
        class(prc_test_def_t), intent(in) :: object
        integer, intent(in) :: unit
    end subroutine prc_test_def_write

```

```

⟨Test ME: test me def: TBP⟩+≡
    procedure :: read => prc_test_def_read

```

```

⟨Test ME: procedures⟩+≡
    subroutine prc_test_def_read (object, unit)
        class(prc_test_def_t), intent(out) :: object
        integer, intent(in) :: unit
    end subroutine prc_test_def_read

```

Allocate the driver for test ME matrix elements. We get the actual component ID (basename), and we can transfer all process-specific data from the process definition.

```

⟨Test ME: test me def: TBP⟩+≡
    procedure :: allocate_driver => prc_test_def_allocate_driver
⟨Test ME: procedures⟩+≡
    subroutine prc_test_def_allocate_driver (object, driver, basename)
        class(prc_test_def_t), intent(in) :: object
        class(prc_core_driver_t), intent(out), allocatable :: driver
        type(string_t), intent(in) :: basename
        allocate (prc_test_t :: driver)
        select type (driver)
        type is (prc_test_t)
            driver%id = basename
            driver%model_name = object%model_name
            select case (size (object%prt_in))
            case (1); driver%scattering = .false.
            case (2); driver%scattering = .true.
            end select
        end select
    end subroutine prc_test_def_allocate_driver

```

Nothing to connect. This subroutine will not be called.

```

⟨Test ME: test me def: TBP⟩+≡
    procedure :: connect => prc_test_def_connect
⟨Test ME: procedures⟩+≡
    subroutine prc_test_def_connect (def, lib_driver, i, proc_driver)
        class(prc_test_def_t), intent(in) :: def
        class(prclib_driver_t), intent(in) :: lib_driver
        integer, intent(in) :: i
        class(prc_core_driver_t), intent(inout) :: proc_driver
    end subroutine prc_test_def_connect

```

### 13.6.2 Driver

```

⟨Test ME: public⟩+≡
  public :: prc_test_t

⟨Test ME: types⟩+≡
  type, extends (process_driver_internal_t) :: prc_test_t
    type(string_t) :: id
    type(string_t) :: model_name
    logical :: scattering = .true.
  contains
    ⟨Test ME: test me driver: TBP⟩
  end type prc_test_t

```

In contrast to generic matrix-element implementations, we can hard-wire the amplitude method as a type-bound procedure.

```

⟨Test ME: test me driver: TBP⟩≡
  procedure, nopass :: get_amplitude => prc_test_get_amplitude

⟨Test ME: procedures⟩+≡
  function prc_test_get_amplitude (p) result (amp)
    complex(default) :: amp
    real(default), dimension(:, :), intent(in) :: p
    amp = 1
  end function prc_test_get_amplitude

```

The reported type is the same as for the `prc_test_def_t` type.

```

⟨Test ME: test me driver: TBP⟩+≡
  procedure, nopass :: type_name => prc_test_type_name

⟨Test ME: procedures⟩+≡
  function prc_test_type_name () result (string)
    type(string_t) :: string
    string = "test_me"
  end function prc_test_type_name

```

Fill process constants.

```

⟨Test ME: test me driver: TBP⟩+≡
  procedure :: fill_constants => prc_test_fill_constants

⟨Test ME: procedures⟩+≡
  subroutine prc_test_fill_constants (driver, data)
    class(prc_test_t), intent(in) :: driver
    type(process_constants_t), intent(out) :: data
    data%id = driver%id
    data%model_name = driver%model_name
    if (driver%scattering) then
      data%n_in = 2
      data%n_out = 2
      data%n_flv = 1
      data%n_hel = 1
      data%n_col = 1
      data%n_cin = 2
      data%n_cf = 1
    end if
  end subroutine prc_test_fill_constants

```

```

allocate (data%flv_state (4, 1))
data%flv_state = 25
allocate (data%hel_state (4, 1))
data%hel_state = 0
allocate (data%col_state (2, 4, 1))
data%col_state = 0
allocate (data%ghost_flag (4, 1))
data%ghost_flag = .false.
allocate (data%color_factors (1))
data%color_factors = 1
allocate (data%cf_index (2, 1))
data%cf_index = 1
else
    data%n_in  = 1
    data%n_out = 2
    data%n_flv = 1
    data%n_hel = 2
    data%n_col = 1
    data%n_cin = 2
    data%n_cf  = 1
    allocate (data%flv_state (3, 1))
    data%flv_state(:,1) = [25, 6, -6]
    allocate (data%hel_state (3, 2))
    data%hel_state(:,1) = [0, 1,-1]
    data%hel_state(:,2) = [0,-1, 1]
    allocate (data%col_state (2, 3, 1))
    data%col_state = reshape ([0,0, 1,0, 0,-1], [2,3,1])
    allocate (data%ghost_flag (3, 1))
    data%ghost_flag = .false.
    allocate (data%color_factors (1))
    data%color_factors = 3
    allocate (data%cf_index (2, 1))
    data%cf_index = 1
end if
end subroutine prc_test_fill_constants

```

### 13.6.3 Shortcut

Since this module is there for testing purposes, we set up a subroutine that does all the work at once: create a library with the two processes (scattering and decay), configure and load, and set up the driver.

```

<Test ME: public>+≡
public :: prc_test_create_library
<Test ME: procedures>+≡
subroutine prc_test_create_library &
    (libname, lib, scattering, decay, procname1, procname2)
    type(string_t), intent(in) :: libname
    type(process_library_t), intent(out) :: lib
    logical, intent(in), optional :: scattering, decay
    type(string_t), intent(in), optional :: procname1, procname2
    type(string_t) :: model_name, procname
    type(string_t), dimension(:), allocatable :: prt_in, prt_out

```

```

class(prc_core_def_t), allocatable :: def
type(process_def_entry_t), pointer :: entry
type(os_data_t) :: os_data
logical :: sca, dec
sca = .true.; if (present (scattering)) sca = scattering
dec = .false.; if (present (decay)) dec = decay

call os_data_init (os_data)
call lib%init (libname)
model_name = "Test"

if (sca) then
    if (present (procname1)) then
        procname = procname1
    else
        procname = libname
    end if
    allocate (prt_in (2), prt_out (2))
    prt_in  = [var_str ("s"), var_str ("s")]

### Generate and load the scattering process

The process is  $ss \rightarrow ss$ , where  $s$  is a trivial scalar particle, for vanishing mass and unit coupling. We initialize the process, build the library, and compute the particular matrix element for momenta of unit energy and right-angle scattering. (The scattering is independent of angle.) The matrix element is equal to unity.

# Chapter 14

# Particles

This chapter collects modules that implement particle objects, for use in event records.

While within interactions, all correlations are manifest, a particle array is derived by selecting a particular quantum number set. This involves tracing over all other particles, as far as polarization is concerned. Thus, a particle has definite flavor, color, and a single-particle density matrix for polarization.

**polarizations** The polarization object is based on a `state_matrix_t` object.  
It describes the spin density matrix of a particle.

**particles** Particle objects and particle lists, as the base of event records.

## 14.1 Polarization

Particle polarization is determined by a particular quantum state which has just helicity information. For defining polarizations, we adopt the phase convention for a spin-1/2 particle that

$$\rho = \frac{1}{2}(1 + \vec{\alpha} \cdot \vec{\sigma}) \quad (14.1)$$

with the polarization axis  $\vec{\alpha}$ . Using this, we define

1. Trivial polarization:  $\vec{\alpha} = 0$ . [This is unpolarized, but distinct from the particular undefined polarization matrix which has the same meaning.]
2. Circular polarization:  $\vec{\alpha}$  points in  $\pm z$  direction.
3. Transversal polarization:  $\vec{\alpha}$  points orthogonal to the  $z$  direction, with a phase  $\phi$  that is 0 for the  $x$  axis, and  $\pi/2 = 90^\circ$  for the  $y$  axis. For antiparticles, the phase switches sign, corresponding to complex conjugation.
4. Axis polarization, where we explicitly give  $\vec{\alpha}$ .

For higher spin, we retain this definition, but apply it to the two components with maximum and minimum weight. For massless particles, this is sufficient. For massive particles, we add the possibilities:

5. Longitudinal polarization: Only the 0-component is set. This is possible only for bosons.
6. Diagonal polarization: Explicitly specify all components in the helicity basis.

Obviously, this does not exhaust the possible density matrices for higher spin, but it should cover all practical applications.

```
<polarizations.f90>≡

  <Standard module head>

  <Polarizations: public>
  <Polarizations: types>
  <Polarizations: interfaces>
```

```

contains

⟨Polarizations: procedures⟩

end module polarizations

```

### 14.1.1 The polarization type

This is not an extension, but rather a restriction of the quantum state. Flavor and color are ignored, there is just a one-particle helicity density matrix.

```

⟨Polarizations: public⟩≡
    public :: polarization_t

⟨Polarizations: types⟩≡
    type :: polarization_t
        logical :: polarized = .false.
        integer :: spin_type = 0
        integer :: multiplicity = 0
        type(state_matrix_t) :: state
    end type polarization_t

```

### 14.1.2 Basic initializer and finalizer

We need the particle flavor for determining the allowed helicity values. The density matrix is not set, but prepared to be filled later. This is private.

```

⟨Polarizations: procedures⟩≡
    subroutine polarization_init (pol, flv)
        type(polarization_t), intent(out) :: pol
        type(flavor_t), intent(in) :: flv
        pol%spin_type = flv%get_spin_type ()
        pol%multiplicity = flv%get_multiplicity ()
        call pol%state%init (store_values = .true.)
    end subroutine polarization_init

```

The finalizer has to be public. The quantum state contains memory allocated to pointers.

```

⟨Polarizations: public⟩+≡
    public :: polarization_final

⟨Polarizations: procedures⟩+≡
    subroutine polarization_final (pol)

end do
end select
call pol%state%freeze ()
call pol%state%set_matrix_element (value)
end subroutine polarization_init_trivial

```

The following three modes are useful mainly for spin-1/2 particle and massless particles of any nonzero spin. Only the highest-weight components are filled.

Circular polarization: The density matrix of the two highest-weight states is

$$\rho(f) = \frac{1 - |f|}{2} \mathbf{1} + |f| \times \begin{cases} \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix}, & f > 0; \\ \begin{pmatrix} 0 & 0 \\ 0 & 0 \end{pmatrix}, & f < 0, \end{cases}$$

If the polarization fraction  $|f|$  is unity, we need only one entry in the density matrix.

```

<Polarizations: public>+≡
public :: polarization_init_circular

    call hel(1)%init (hmax)
    call hel(2)%init (-hmax)
    if (abs (fraction) /= 1) then
        value = (1 + fraction) / 2
        call qn(1)%init (hel(1))
    end if
end subroutine polarization_init_circular

```

```

call pol%state%add_state (qn, value=value)
value = (1 - fraction) / 2
call qn(1)%init (hel(2))
call pol%state%add_state (qn, value=value)
else
    value = abs (fraction)
    if (fraction > 0) then
        call qn(1)%init (hel(1))
    else
        call qn(1)%init (hel(2))
    end if
    call pol%state%add_state (qn, value=value)
end if
call pol%state%freeze ()
end subroutine polarization_init_circular

```

Transversal polarization is analogous to circular, but we get a density matrix

$$\rho(f, \phi) = \frac{1 - |f|}{2} \mathbf{1} + \frac{|f|}{2} \begin{pmatrix} 1 & e^{-i\phi} \\ e^{i\phi} & 1 \end{pmatrix}.$$

The phase is  $\phi = 0$  for the  $x$ -axis,  $\phi = 90^\circ$  for the  $y$  axis as polarization vector. For an antiparticle, the phase switches sign, and for  $f < 0$ , the off-diagonal elements switch sign.

```

⟨Polarizations: public⟩+≡
public :: polarization_init_transversal
⟨Polarizations: procedures⟩+≡
subroutine polarization_init_transversal (pol, flv, phi, fraction)

    call polarization_init_axis &
        (pol, flv, fraction * [ cos (phi), sin (phi), 0._default])
end subroutine polarization_init_transversal

```

For axis polarization, we again set only the entries with maximum weight.

$$\rho(f, \phi) = \frac{1}{2} \begin{pmatrix} 1 + \alpha_3 & \alpha_1 - i\alpha_2 \\ \alpha_1 + i\alpha_2 & 1 - \alpha_3 \end{pmatrix}.$$

For an antiparticle,  $\alpha_2$  switches sign (complex conjugate).

```

### 14.1.7 Operations

Combine polarization states by computing the outer product of the state matrices.

```

<Polarizations: public>+≡
    public :: combine_polarization_states

<Polarizations: procedures>+≡
    subroutine combine_polarization_states (pol, state)
        type(polarization_t), dimension(:), intent(in), target :: pol
        type(state_matrix_t), intent(out) :: state
        call outer_multiply (pol%state, state)

```

```
end subroutine combine_polarization_states
```

Transform a polarization density matrix into a polarization vector. This is possible without information loss only for spin-1/2 and for massless particles. To get a unique answer in all cases, we consider only the components with highest weight. Obviously, this loses the longitudinal component of a massive vector, for instance.

This is the inverse operation of `polarization_init_axis` above, where the polarization fraction is set to unity.

```
(Polarizations: public)+≡
public :: polarization_get_axis

#### 14.1.8 Sparse Matrix

We introduce a simpler implementation of a sparse matrix that should represent polarization. It consists of an integer array that represents the index values, and a complex array that represents the nonvanishing entries. The number of nonvanishing entries must be known for initialization, but the entries are filled one at a time.

This should eventually replace the more baroque polarization definition above, but in the first stage we introduce it just as an intermediaige storage container.

Here is a base type without the special properties of a spin-density matrix.

```

⟨Polarizations: public⟩+≡
public :: smatrix_t

⟨Polarizations: types⟩+≡
type :: smatrix_t
  private
  integer :: dim = 0
  integer :: n_entry = 0
  integer, dimension(:, :, ), allocatable :: index
  complex(default), dimension(:, ), allocatable :: value
contains
  ⟨Polarizations: smatrix: TBP⟩
end type smatrix_t

```

Output.

```
<Polarizations: smatrix: TBP>≡
    procedure :: write => smatrix_write
<Polarizations: procedures>+≡
    subroutine smatrix_write (object, unit, indent)
        class(smatrix_t), intent(in) :: object
        integer, intent(in), optional :: unit, indent
        integer :: u, i, ind
        u = given_output_unit (unit)
        ind = 0; if (present (indent)) ind = indent
        if (allocated (object%value)) then
            if (size (object%value) > 0) then
                do i = 1, object%n_entry
                    write (u, "(1x,A,'@(')", advance="no") repeat (" ", ind)
                    write (u, "(SP,9999(I2.1,:',ix))", advance="no") &
                        object%index(:,i)
                    write (u, "(',' // FMT_19 // ',',,' // FMT_19 // &
                        ','))'" object%value(i)
                end do
            else
                write (u, "(1x,A)", advance="no") repeat (" ", ind)
                write (u, "(A)") "[empty matrix]"
            end if
        else
            write (u, "(1x,A)", advance="no") repeat (" ", ind)
            write (u, "(A)") "[undefined matrix]"
        end if
    end subroutine smatrix_write
```

Initialization: allocate arrays to the correct size. We specify both the dimension of the matrix (if different from two, this is rather a generic tensor) and the number of nonvanishing entries.

```
<Polarizations: smatrix: TBP>+≡
    procedure :: init => smatrix_init
<Polarizations: procedures>+≡
    subroutine smatrix_init (smatrix, dim, n_entry)
        class(smatrix_t), intent(out) :: smatrix
        integer, intent(in) :: dim
        integer, intent(in) :: n_entry
        smatrix%dim = dim
        smatrix%n_entry = n_entry
        allocate (smatrix%index (dim, n_entry))
        allocate (smatrix%value (n_entry))
    end subroutine smatrix_init
```

Fill: one entry at a time.

```
<Polarizations: smatrix: TBP>+≡
    procedure :: set_entry => smatrix_set_entry
<Polarizations: procedures>+≡
    subroutine smatrix_set_entry (smatrix, i, index, value)
        class(smatrix_t), intent(inout) :: smatrix
```

```

integer, intent(in) :: i
integer, dimension(:), intent(in) :: index
complex(default), intent(in) :: value
smatrix%index(:,i) = index
smatrix%value(i) = value
end subroutine smatrix_set_entry

```

#### 14.1.9 Polarization Matrix

As an extension of the more generic `smatrix` type, we implement a proper spin-density matrix. After the matrix has been filled, we can fix spin type and multiplicity for a particle, check the matrix for consistency, and normalize it if necessary.

```

⟨Polarizations: public⟩+≡
public :: pmatrix_t
⟨Polarizations: types⟩+≡
type, extends (smatrix_t) :: pmatrix_t
private
integer :: spin_type = 0
integer :: multiplicity = 0
logical :: massive = .true.
integer :: chirality = 0
real(default) :: degree = 1
logical :: pure = .false.
contains
⟨Polarizations: pmatrix: TBP⟩
end type pmatrix_t

```

Output, including extra data. (The `indent` argument is ignored.)

```

⟨Polarizations: pmatrix: TBP⟩≡
procedure :: write => pmatrix_write
⟨Polarizations: procedures⟩+≡
subroutine pmatrix_write (object, unit, indent)
class(pmatrix_t), intent(in) :: object
integer, intent(in), optional :: unit, indent
integer :: u
u = given_output_unit (unit)
write (u, "(1x,A)") "Polarization: spin density matrix"
write (u, "(3x,A,I0)") "spin type      =", object%spin_type
write (u, "(3x,A,I0)") "multiplicity   =", object%multiplicity
write (u, "(3x,A,L1)") "massive       =", object%massive
write (u, "(3x,A,I0)") "chirality      =", object%chirality
write (u, "(3x,A,F10.7)") "pol.degree    =", object%degree
write (u, "(3x,A,L1)") "pure state    =", object%pure
call object%smatrix_t%write (u, 1)
end subroutine pmatrix_write

```

This assignment is trivial, but must be coded explicitly.

```

⟨Polarizations: pmatrix: TBP⟩+≡
generic :: assignment(=) => pmatrix_assign_from_smatrix

```

```

procedure, private :: pmatrix_assign_from_smatrix
(Polarizations: procedures) +≡
    subroutine pmatrix_assign_from_smatrix (pmatrix, smatrix)
        class(pmatrix_t), intent(out) :: pmatrix
        type(smatrix_t), intent(in) :: smatrix
        pmatrix%smatrix_t = smatrix
    end subroutine pmatrix_assign_from_smatrix

```

Declare spin, multiplicity, and polarization degree. Check whether all entries fit, and whether this is a valid matrix.

The required properties are:

1. all entries apply to the given spin and mass type
2. the diagonal is real
3. only the upper or corresponding off-diagonal elements is specified, i.e., the row index is less than the column index
4. the trace is nonnegative and equal to the polarization degree (the remainder, proportional to the unit matrix, is understood to be present)
5. the trace of the matrix square is positive and less or equal to the trace of the matrix itself, which is the polarization degree. (If it is equal, we are dealing with a pure state).

```

    <Particles: parameters>
    <Particles: types>
    <Particles: interfaces>
    contains
    <Particles: procedures>
  end module particles
```

### 14.2.1 The particle type

#### Particle status codes

The overall status codes (incoming/outgoing etc.) are inherited from the module `subevents`.

Polarization status:

```
<Particles: parameters>≡
```

```

integer, parameter, public :: PRT_UNPOLARIZED = 0
integer, parameter, public :: PRT_DEFINITE_HELCITY = 1
integer, parameter, public :: PRT_GENERIC_POLARIZATION = 2

```

### Definition

The quantum numbers are flavor (from which invariant particle properties can be derived), color, and polarization. The particle may be unpolarized. In this case, `hel` and `pol` are unspecified. If it has a definite helicity, the `hel` component is defined. If it has a generic polarization, the `pol` component is defined. For each particle we store the four-momentum and the invariant mass squared, i.e., the squared norm of the four-momentum. There is also an optional list of parent and child particles, for bookkeeping in physical events. The vertex is an optional component that consists of a Lorentz 4-vector, denoting the position and time of the vertex (displaced vertex/time).

```

⟨Particles: public⟩≡
    public :: particle_t
⟨Particles: types⟩≡
    type :: particle_t

        call particle%set_status (status)
        call particle%set_momentum (mom)
    end subroutine particle_init_external

```

Initialize a particle using a single-particle state matrix which determines flavor, color, and polarization. The state matrix must have unique flavor and color. The factorization mode determines whether the particle is unpolarized, has definite helicity, or generic polarization. This mode is translated into the polarization status.

```

⟨Particles: particle: TBP⟩+≡

### Setting contents

Reset the status code. Where applicable, set  $p^2$  assuming that the particle is on-shell.

```

⟨Particles: particle: TBP⟩+≡
  procedure :: reset_status => particle_reset_status

⟨Particles: procedures⟩+≡
  elemental subroutine particle_reset_status (prt, status)
    class(particle_t), intent(inout) :: prt
    integer, intent(in) :: status
    prt%status = status
    select case (status)
    case (PRT_BEAM, PRT_INCOMING, PRT_OUTGOING)
      prt%p2 = prt%flv%get_mass () ** 2
    end select
  end subroutine particle_reset_status

```

The color can be given explicitly.

```

⟨Particles: particle: TBP⟩+≡
  procedure :: set_color => particle_set_color

⟨Particles: procedures⟩+≡
  elemental subroutine particle_set_color (prt, col)
    class(particle_t), intent(inout) :: prt
    type(color_t), intent(in) :: col
    prt%col = col
  end subroutine particle_set_color

```

The flavor can be given explicitly.

```

⟨Particles: particle: TBP⟩+≡
  procedure :: set_flavor => particle_set_flavor

⟨Particles: procedures⟩+≡
  subroutine particle_set_flavor (prt, flv)
    class(particle_t), intent(inout) :: prt
    type(flavor_t), intent(in) :: flv
    prt%flv = flv
  end subroutine particle_set_flavor

```

As can the helicity.

```

⟨Particles: particle: TBP⟩+≡
  procedure :: set_helicity => particle_set_helicity

```

```

⟨Particles: procedures⟩+≡
    subroutine particle_set_helicity (prt, hel)

```

```
end function particle_momentum_to_pythia6
```

### 14.2.2 Particle sets

A particle set is what is usually called an event: an array of particles. The individual particle entries carry momentum, quantum numbers, polarization, and optionally connections. There is (also optionally) a correlated state-density matrix that maintains spin correlations that are lost in the individual particle entries.

```
(Particles: public)+≡
  public :: particle_set_t
(Particles: types)+≡
  type :: particle_set_t
    integer :: n_beam = 0
    integer :: n_in = 0
    integer :: n_vir = 0
    integer :: n_out = 0
    integer :: n_tot = 0
    type(particle_t), dimension(:), allocatable :: prt
    type(state_matrix_t) :: correlated_state
    contains
      (Particles: particle set: TBP)
  end type particle_set_t
```

A particle set can be initialized from an interaction or from a HepMC event record.

```
(Particles: particle set: TBP)≡
  generic :: init => init_interaction
  procedure :: init_interaction => particle_set_init_interaction
```

When a particle set is initialized from a given interaction, we have to determine the branch within the original state matrix that fixes the particle quantum numbers. This is done with the appropriate probabilities, based on a random number *x*. The *mode* determines whether the individual particles become unpolarized, or take a definite (diagonal) helicity, or acquire single-particle polarization matrices. The flag *keep\_correlations* tells whether the spin-correlation matrix is to be calculated and stored in addition to the particles. The flag *keep\_virtual* tells whether virtual particles should be dropped. Note that if virtual particles are dropped, the spin-correlation matrix makes no sense, and parent-child relations are not set.

For a correct disentangling of color and flavor (in the presence of helicity), we consider two interactions. *int* has no color information, and is used to select a flavor state. Consequently, we trace over helicities here. *int\_flows* contains color-flow and potentially helicity information, but is useful only after the flavor combination has been chosen. So this interaction is used to select helicity and color, but restricted to the selected flavor combination.

*int* and *int\_flows* may be identical if there is only a single (or no) color flow. If there is just a single flavor combination, *x*(1) can be set to zero.

The current algorithm of evaluator convolution requires that the beam particles are assumed outgoing (in the beam interaction) and become virtual in all

derived interactions. In the particle set they should be re-identified as incoming. The optional integer `n_incoming` can be used to perform this correction.

The flag `is_valid` is false if factorization of the state is not possible, in particular if the squared matrix element is zero.

### 14.2.3 I/O formats

Here, we define input/output of particle sets in various formats. This is the right place since particle sets contain most of the event information.

All write/read routines take as first argument the object, as second argument the I/O unit which in this case is a mandatory argument. Then follow further event data.

#### Internal binary format

This format is supposed to contain the complete information, so the particle data set can be fully reconstructed. The exception is the model part of the particle flavors; this is unassigned for the flavor values read from file.

```

This procedure reconstructs an array of vertex indices from the parent-child information in the particle entries, according to the HepMC scheme. For each particle, we determine which vertex it comes from and which vertex it goes to. We return the two arrays and the maximum vertex index.

For each particle in the list, we first check its parents. If for any parent the vertex where it goes to is already known, this vertex index is assigned as the current 'from' vertex. Otherwise, a new index is created, assigned as the current 'from' vertex, and as the 'to' vertex for all parents.

Then, the analogous procedure is done for the children.

Furthermore, we assign to each vertex the vertex position from the parent(s). We check that these vertex positions coincide, and if not return a null vector.

```

#### 14.2.4 Expression interface

This converts a `particle_set` object as defined here to a more concise `subevt` object that can be used as the event root of an expression. In particular, the latter lacks virtual particles, spin correlations and parent-child relations.

We keep beam particles, incoming partons, and outgoing partons. Furthermore, we keep radiated particles (a.k.a. beam remnants) if they have no children in the current particle set, and mark them as outgoing particles.

```

# Chapter 15

## Beams

These modules implement beam configuration and beam structure, the latter in abstract terms.

**beam\_structures** The `beam_structure_t` type is a messenger type that communicates the user settings to the WHIZARD core.

**beams** Beam configuration.

**sf\_aux** Tools for handling structure functions and splitting

**sf\_mappings** Mapping functions, useful for structure function implementation

**sf\_base** The abstract structure-function interaction and structure-function chain types.

These are the implementation modules, the concrete counterparts of `sf_base`:

**sf\_isr** ISR structure function (photon radiation inclusive and resummed in collinear and IR regions).

**sf\_epa** Effective Photon Approximation.

**sf\_ewa** Effective  $W$  (and  $Z$ ) approximation.

**sf\_escan** Energy spectrum that emulates a uniform energy scan.

**sf\_gaussian** Gaussian beam spread

**sf\_beam\_events** Beam-event generator that reads its input from an external file.

**sf\_circe1** CIRCE1 beam spectra for electrons and photons.

**sf\_circe2** CIRCE2 beam spectra for electrons and photons.

**hoppet\_interface** Support for  $b$ -quark matching, addon to PDF modules.

**sf\_pdf\_builtin** Direct support for selected hadron PDFs.

**sf\_lhapdf** LHAPDF library support.

## 15.1 Beam structure

This module stores the beam structure definition as it is declared in the SINDARIN script. The structure definition is not analyzed, just recorded for later use.

We do not capture any numerical parameters, just names of particles and structure functions.

```
<beam_structures.f90>≡
  <File header>

  module beam_structures

    <Use kinds>
    <Use strings>
      use io_units
      use format_defs, only: FMT_19
      use diagnostics
      use lorentz
      use polarizations

    <Standard module head>

    <Beam structures: public>

    <Beam structures: types>

    <Beam structures: interfaces>

    contains

    <Beam structures: procedures>

  end module beam_structures
```

### 15.1.1 Beam structure elements

An entry in a beam-structure record consists of a string that denotes a type of structure function.

```
<Beam structures: types>≡
  type :: beam_structure_entry_t
    logical :: is_valid = .false.
    type(string_t) :: name
  contains
    <Beam structures: beam structure entry: TBP>
  end type beam_structure_entry_t
```

Output.

```
<Beam structures: beam structure entry: TBP>≡
  procedure :: to_string => beam_structure_entry_to_string
<Beam structures: procedures>≡
  function beam_structure_entry_to_string (object) result (string)
    class(beam_structure_entry_t), intent(in) :: object
```

```

type(string_t) :: string
if (object%is_valid) then
    string = object%name
else
    string = "none"
end if
end function beam_structure_entry_to_string

```

A record in the beam-structure sequence denotes either a structure-function entry, a pair of such entries, or a pair spectrum.

```

⟨Beam structures: types⟩+≡
type :: beam_structure_record_t
    type(beam_structure_entry_t), dimension(:), allocatable :: entry
end type beam_structure_record_t

```

### 15.1.2 Beam structure type

The beam-structure object contains the beam particle(s) as simple strings. The sequence of records indicates the structure functions by name. No numerical parameters are stored.

```

⟨Beam structures: public⟩≡
public :: beam_structure_t
⟨Beam structures: types⟩+≡
type :: beam_structure_t
    private
    integer :: n_beam = 0
    type(string_t), dimension(:), allocatable :: prt
    type(beam_structure_record_t), dimension(:), allocatable :: record
    type(smatrix_t), dimension(:), allocatable :: smatrix
    real(default), dimension(:), allocatable :: pol_f
    real(default), dimension(:), allocatable :: p
    real(default), dimension(:), allocatable :: theta
    real(default), dimension(:), allocatable :: phi
contains
⟨Beam structures: beam structure: TBP⟩
end type beam_structure_t

```

The finalizer deletes all contents explicitly, so we can continue with an empty beam record. (It is not needed for deallocation.) We have distinct finalizers for the independent parts of the beam structure.

```

⟨Beam structures: beam structure: TBP⟩≡
procedure :: final_sf => beam_structure_final_sf
⟨Beam structures: procedures⟩+≡
subroutine beam_structure_final_sf (object)
    class(beam_structure_t), intent(inout) :: object
    if (allocated (object%prt))  deallocate (object%prt)
    if (allocated (object%record))  deallocate (object%record)
    object%n_beam = 0
end subroutine beam_structure_final_sf

```

Output. The actual information fits in a single line, therefore we can provide a `to_string` method. The `show` method also lists the current values of relevant global variables.

```

⟨Beam structures: beam structure: TBP⟩+≡
procedure :: write => beam_structure_write
procedure :: to_string => beam_structure_to_string

⟨Beam structures: procedures⟩+≡

      string = ""
    end if
  case (2)
    if (with_beams) then

```

```

        string = object%prt(1) // ", " // object%prt(2)
    else
        string = ""
    end if
    if (allocated (object%record)) then
        if (size (object%record) > 0) then
            if (with_beams) string = string // " => "
            do i = 1, size (object%record)
                if (i > 1) string = string // " => "
                do j = 1, size (object%record(i)%entry)
                    if (j > 1) string = string // ","
                    string = string // object%record(i)%entry(j)%to_string ()
                end do
            end do
        end if
    end if
    case default
        string = "[any particles]"
    end select
end function beam_structure_to_string

```

Initializer: dimension the beam structure record. Each array element denotes the number of entries for a record within the beam-structure sequence. The number of entries is either one or two, while the number of records is unlimited.

*(Beam structures: beam structure: TBP)*+≡

```

procedure :: init_sf => beam_structure_init_sf
(Beam structures: procedures)+≡
subroutine beam_structure_init_sf (beam_structure, prt, dim_array)
    class(beam_structure_t), intent(inout) :: beam_structure
    type(string_t), dimension(:), intent(in) :: prt
    integer, dimension(:), intent(in), optional :: dim_array
    integer :: i
    call beam_structure%final_sf ()
    beam_structure%n_beam = size (prt)
    allocate (beam_structure%prt (size (prt)))
    beam_structure%prt = prt
    if (present (dim_array)) then
        allocate (beam_structure%record (size (dim_array)))
        do i = 1, size (dim_array)
            allocate (beam_structure%record(i)%entry (dim_array(i)))
        end do
    else
        allocate (beam_structure%record (0))
    end if
end subroutine beam_structure_init_sf

```

Set an entry, specified by record number and entry number.

*(Beam structures: beam structure: TBP)*+≡

```

procedure :: set_sf => beam_structure_set_sf
(Beam structures: procedures)+≡
subroutine beam_structure_set_sf (beam_structure, i, j, name)
    class(beam_structure_t), intent(inout) :: beam_structure

```

```

integer, intent(in) :: i, j
type(string_t), intent(in) :: name
associate (entry => beam_structure%record(i)%entry(j))
    entry%name = name
    entry%is_valid = .true.
end associate
end subroutine beam_structure_set_sf

```

Expand the beam-structure object. (i) For a pair spectrum, keep the entry. (ii) For a single-particle structure function written as a single entry, replace this by a record with two entries. (ii) For a record with two nontrivial entries, separate this into two records with one trivial entry each.

To achieve this, we need a function that tells us whether an entry is a spectrum or a structure function. It returns 0 for a trivial entry, 1 for a single-particle structure function, and 2 for a two-particle spectrum.

*(Beam structures: interfaces)*≡

```

abstract interface
    function strfun_mode_fun (name) result (n)
        import
        type(string_t), intent(in) :: name
        integer :: n
    end function strfun_mode_fun
end interface

```

Algorithm: (1) Mark entries as invalid where necessary. (2) Count the number of entries that we will need. (3) Expand and copy entries to a new record array. (4) Replace the old array by the new one.

*(Beam structures: beam structure: TBP)*+≡

```

procedure :: expand => beam_structure_expand

```

*(Beam structures: procedures)*+≡

```

subroutine beam_structure_expand (beam_structure, strfun_mode)
    class(beam_structure_t), intent(inout) :: beam_structure

            end if
        end do
    end select
end associate
end do
call move_alloc (from = new, to = beam_structure%record)
end subroutine beam_structure_expand

```

### 15.1.3 Polarization

To record polarization, we provide an allocatable array of `smatrix` objects, sparse matrices. The polarization structure is independent of the structure-function setup, they are combined only when an actual beam object is constructed.

```
(Beam structures: beam structure: TBP)+≡
procedure :: final_pol => beam_structure_final_pol
procedure :: init_pol => beam_structure_init_pol

(Beam structures: procedures)+≡
subroutine beam_structure_final_pol (beam_structure)
  class(beam_structure_t), intent(inout) :: beam_structure
  if (allocated (beam_structure%smatrix)) deallocate (beam_structure%smatrix)
  if (allocated (beam_structure%pol_f)) deallocate (beam_structure%pol_f)
end subroutine beam_structure_final_pol

subroutine beam_structure_init_pol (beam_structure, n)
  class(beam_structure_t), intent(inout) :: beam_structure
  integer, intent(in) :: n
  if (allocated (beam_structure%smatrix)) deallocate (beam_structure%smatrix)
  allocate (beam_structure%smatrix (n))
  if (.not. allocated (beam_structure%pol_f)) &
    allocate (beam_structure%pol_f (n), source = 1._default)
end subroutine beam_structure_init_pol
```

Directly copy the spin density matrices.

```
(Beam structures: beam structure: TBP)+≡
procedure :: set_smatrix => beam_structure_set_smatrix

(Beam structures: procedures)+≡
subroutine beam_structure_set_smatrix (beam_structure, i, smatrix)
  class(beam_structure_t), intent(inout) :: beam_structure
  integer, intent(in) :: i
  type(smatrix_t), intent(in) :: smatrix
  beam_structure%smatrix(i) = smatrix
end subroutine beam_structure_set_smatrix
```

Initialize one of the spin density matrices manually.

```
(Beam structures: beam structure: TBP)+≡
procedure :: init_smatrix => beam_structure_init_smatrix

(Beam structures: procedures)+≡
subroutine beam_structure_init_smatrix (beam_structure, i, n_entry)
  class(beam_structure_t), intent(inout) :: beam_structure
  integer, intent(in) :: i
  integer, intent(in) :: n_entry
  call beam_structure%smatrix(i)%init (2, n_entry)
end subroutine beam_structure_init_smatrix
```

Set a polarization entry.

```
(Beam structures: beam structure: TBP)+≡
procedure :: set_sentry => beam_structure_set_sentry
```

```

```

### 15.2.1 Beam data

The beam data type contains beam data for one or two beams, depending on whether we are dealing with beam collisions or particle decay. In addition, it holds the c.m. energy `sqrts`, the Lorentz transformation `L` that transforms the c.m. system into the lab system, and the pair of c.m. momenta.

```
<Beams: public>≡
  public :: beam_data_t

  <Beams: types>≡
    type :: beam_data_t
      logical :: initialized = .false.
      integer :: n = 0
      type(flavor_t), dimension(:), allocatable :: flv
      real(default), dimension(:), allocatable :: mass
      type(pmatrix_t), dimension(:), allocatable :: pmatrix
      logical :: lab_is_cm_frame = .true.
```

```

type(vector4_t), dimension(:), allocatable :: p_cm
type(vector4_t), dimension(:), allocatable :: p
type(lorentz_transformation_t), allocatable :: L_cm_to_lab
real(default) :: sqrts = 0
character(32) :: md5sum = ""
contains
<Beams: beam data: TBP>
end type beam_data_t

```

Generic initializer. This is called by the specific initializers below. Initialize either for decay or for collision.

```

<Beams: procedures>≡
subroutine beam_data_init (beam_data, n)
  type(beam_data_t), intent(out) :: beam_data
  integer, intent(in) :: n
  beam_data%n = n
  allocate (beam_data%flv (n))
  allocate (beam_data%mass (n))
  allocate (beam_data%pmatrix (n))
  allocate (beam_data%p_cm (n))
  allocate (beam_data%p (n))
  beam_data%initialized = .true.
end subroutine beam_data_init

```

Finalizer: needed for the polarization components of the beams.

```

<Beams: public>+≡

### 15.2.2 Initializers: beam structure

Initialize the beam data object from a beam structure object, given energy and model.

```
(Beams: public)+≡
    public :: beam_data_init_structure

(Beams: procedures)+≡
    subroutine beam_data_init_structure &
        (beam_data, structure, sqrts, model, decay_rest_frame)
        type(beam_data_t), intent(out) :: beam_data
        type(bean_structure_t), intent(in) :: structure
        integer :: n_beam
        real(default), intent(in) :: sqrts
        class(model_data_t), intent(in), target :: model
        logical, intent(in), optional :: decay_rest_frame
        type(flv_t), dimension(:), allocatable :: flv
        n_beam = structure%get_n_beam ()
        allocate (flv (n_beam))
        call flv%init (structure%get_prt (), model)
        if (structure%asymmetric ()) then
            if (structure%polarized ()) then
                call beam_data_init_momenta (beam_data, &
                    structure%get_momenta (), flv, &
                    structure%get_smatrix (), structure%get_pol_f ())
            else
                call beam_data_init_momenta (beam_data, &
                    structure%get_momenta (), flv)
            end if
        else
            select case (n_beam)
            case (1)
                if (structure%polarized ()) then
                    call beam_data_init_decay (beam_data, flv, &
```

```

        structure%get_smatrix (), structure%get_pol_f (), &
        rest_frame = decay_rest_frame)
    else
        call beam_data_init_decay (beam_data, flv, &
        rest_frame = decay_rest_frame)
    end if
case (2)
if (structure%polarized ()) then
    call beam_data_init_sqrt (beam_data, sqrt, flv, &
        structure%get_smatrix (), structure%get_pol_f ())
else
    call beam_data_init_sqrt (beam_data, sqrt, flv)
end if
case default
call msg_bug ("Beam data: invalid beam structure object")
end select
end if
end subroutine beam_data_init_structure

```

### 15.2.3 Initializers: collisions

This is the simplest one: just the two flavors, c.m. energy, polarization. Color is inferred from flavor. Beam momenta and c.m. momenta coincide.

```

⟨Beams: public⟩+≡
public :: beam_data_init_sqrt

⟨Beams: procedures⟩+≡
subroutine beam_data_init_sqrt (beam_data, sqrt, flv, smatrix, pol_f)
    type(beam_data_t), intent(out) :: beam_data
    real(default), intent(in) :: sqrt
    type(flower_t), dimension(:), intent(in) :: flv
    type(smatrix_t), dimension(:), intent(in), optional :: smatrix
    real(default), dimension(:), intent(in), optional :: pol_f
    real(default), dimension(size(flv)) :: E, p
    call beam_data_init (beam_data, size (flv))
    beam_data%sqrt = sqrt
    beam_data%lab_is_cm_frame = .true.
    select case (beam_data%n)
    case (1)
        E = sqrt; p = 0
        beam_data%p_cm = vector4_moving (E, p, 3)
        beam_data%p = beam_data%p_cm
    case (2)
        beam_data%p_cm = colliding_momenta (sqrt, flv%get_mass ())
        beam_data%p = colliding_momenta (sqrt, flv%get_mass ())
    end select
    call beam_data_finish_initialization (beam_data, flv, smatrix, pol_f)
end subroutine beam_data_init_sqrt

```

This version sets beam momenta directly, assuming that they are asymmetric, i.e., lab frame and c.m. frame do not coincide. Polarization info is deferred to a common initializer.

The Lorentz transformation that we compute here is not actually used in the calculation; instead, it will be recomputed for each event in the subroutine `phs_set_incoming_momenta`. We compute it here for the nominal beam setup nevertheless, so we can print it and, in particular, include it in the MD5 sum.

```
<Beams: public>+≡
    public :: beam_data_init_momenta
<Beams: procedures>+≡
    subroutine beam_data_init_momenta (beam_data, p3, flv, smatrix, pol_f)
        type(beam_data_t), intent(out) :: beam_data
        type(vector3_t), dimension(:), intent(in) :: p3
        type(flavor_t), dimension(:), intent(in) :: flv
        type(smatrix_t), dimension(:), intent(in), optional :: smatrix
        real(default), dimension(:), intent(in), optional :: pol_f
        type(vector4_t) :: p0
        type(vector4_t), dimension(:), allocatable :: p, p_cm_rot
        real(default), dimension(size(p3)) :: e
        real(default), dimension(size(flv)) :: m
        type(lorentz_transformation_t) :: L_boost, L_rot
        call beam_data_init (beam_data, size (flv))
        m = flv%get_mass ()
        e = sqrt (p3 ** 2 + m ** 2)
        allocate (p (beam_data%n))
        p = vector4_moving (e, p3)
        p0 = sum (p)
        beam_data%p = p
        beam_data%lab_is_cm_frame = .false.
        beam_data%sqrts = p0 ** 1
        L_boost = boost (p0, beam_data%sqrts)
        allocate (p_cm_rot (beam_data%n))
        p_cm_rot = inverse (L_boost) * p
        allocate (beam_data%L_cm_to_lab)
        select case (beam_data%n)
        case (1)
            beam_data%L_cm_to_lab = L_boost
            beam_data%p_cm = vector4_at_rest (beam_data%sqrts)

                &polarization density array has wrong dimension")
        beam_data%pmatrix(i) = smatrix(i)
    if (present (pol_f)) then
        if (size (pol_f) /= size (smatrix)) &
            call msg_fatal ("Beam data: &
                &polarization fraction array has wrong dimension")
        call beam_data%pmatrix(i)%normalize (flv(i), pol_f(i))
    else
        call beam_data%pmatrix(i)%normalize (flv(i), 1._default)
    end if
else
    call beam_data%pmatrix(i)%init (2, 0)
    call beam_data%pmatrix(i)%normalize (flv(i), 0._default)
end if
end do
call beam_data_compute_md5sum (beam_data)
end subroutine beam_data_finish_initialization

```

The MD5 sum is stored within the beam-data record, so it can be checked for integrity in subsequent runs.

*(Beams: procedures)*+≡

```

subroutine beam_data_compute_md5sum (beam_data)
    type(bean_data_t), intent(inout) :: beam_data
    integer :: unit
    unit = free_unit ()
    open (unit = unit, status = "scratch", action = "readwrite")
    call beam_data_write (beam_data, unit, write_md5sum = .false., &
        verbose = .true.)
    rewind (unit)
    beam_data%md5sum = md5sum (unit)
    close (unit)
end subroutine beam_data_compute_md5sum

```

#### 15.2.4 Initializers: decays

This is the simplest one: decay in rest frame. We need just flavor and polarization. Color is inferred from flavor. Beam momentum and c.m. momentum coincide.

*(Beams: public)*+≡

```

public :: beam_data_init_decay

```

*(Beams: procedures)*+≡

```

subroutine beam_data_init_decay (beam_data, flv, smatrix, pol_f, rest_frame)
    type(bean_data_t), intent(out) :: beam_data
    type(flavor_t), dimension(1), intent(in) :: flv

```

```

type(smatrix_t), dimension(1), intent(in), optional :: smatrix
real(default), dimension(:, :), intent(in), optional :: pol_f
logical, intent(in), optional :: rest_frame
real(default), dimension(1) :: m
m = flv%get_mass ()
if (present (smatrix)) then
    call beam_data_init_sqrt (beam_data, m(1), flv, smatrix, pol_f)
else
    call beam_data_init_sqrt (beam_data, m(1), flv, smatrix, pol_f)
end if
if (present (rest_frame)) beam_data%lab_is_cm_frame = rest_frame
end subroutine beam_data_init_decay

```

### 15.2.5 Sanity check

After the beams have been set, the initial-particle masses may have been modified. This can be checked here.

```

⟨Beams: public⟩+≡
    public :: beam_data_masses_are_consistent

⟨Beams: procedures⟩+≡
    function beam_data_masses_are_consistent (beam_data) result (flag)
        logical :: flag
        type(beam_data_t), intent(in) :: beam_data
        flag = all (nearly_equal (beam_data%mass, beam_data%flv%get_mass ()))
    end function beam_data_masses_are_consistent

```

### 15.2.6 The beams type

Beam objects are interaction objects that contain the actual beam data including polarization and density matrix. For collisions, the beam object actually contains two beams.

```

⟨Beams: public⟩+≡
    public :: beam_t

⟨Beams: types⟩+≡
    type :: beam_t
        private
        type(interaction_t) :: int
    end type beam_t

```

The constructor contains code that converts beam data into the (entangled) particle-pair quantum state. First, we set the number of particles and polarization mask. (The polarization mask is handed over to all later interactions, so if helicity is diagonal or absent, this fact is used when constructing the hard-interaction events.) Then, we construct the entangled state that combines helicity, flavor and color of the two particles (where flavor and color are unique, while several helicity states are possible). Then, we transfer this state together

with the associated values from the spin density matrix into the `interaction_t` object.

⟨SF aux: parameters⟩

⟨SF aux: types⟩

contains

⟨SF aux: procedures⟩

end module sf_aux

```

### 15.3.1 Momentum splitting

Let us consider first an incoming parton with momentum  $k$  and invariant mass squared  $s = k^2$  that splits into two partons with momenta  $q, p$  and invariant masses  $t = q^2$  and  $u = p^2$ . (This is an abuse of the Mandelstam notation.  $t$  is actually the momentum transfer, assuming that  $p$  is radiated and  $q$  initiates the hard process.) The energy is split among the partons such that if  $E = k^0$ , we have  $q^0 = xE$  and  $p^0 = \bar{x}E$ , where  $\bar{x} \equiv 1 - x$ .

We define the angle  $\theta$  as the polar angle of  $p$  w.r.t. the momentum axis of the incoming momentum  $k$ . Ignoring azimuthal angle, we can write the four-momenta in the basis  $(E, p_T, p_L)$  as

$$k = \begin{pmatrix} E \\ 0 \\ p \end{pmatrix}, \quad p = \begin{pmatrix} \bar{x}E \\ \bar{x}\bar{p} \sin \theta \\ \bar{x}\bar{p} \cos \theta \end{pmatrix}, \quad q = \begin{pmatrix} xE \\ -\bar{x}\bar{p} \sin \theta \\ p - \bar{x}\bar{p} \cos \theta \end{pmatrix}, \quad (15.1)$$

where the first two mass-shell conditions are

$$p^2 = E^2 - s, \quad \bar{p}^2 = E^2 - \frac{u}{\bar{x}^2}. \quad (15.2)$$

The second condition implies that, for positive  $u$ ,  $\bar{x}^2 > u/E^2$ , or equivalently

$$x < 1 - \sqrt{u}/E. \quad (15.3)$$

We are interested in the third mass-shell conditions:  $s$  and  $u$  are fixed, so we need  $t$  as a function of  $\cos \theta$ :

$$t = -2\bar{x}(E^2 - p\bar{p}\cos \theta) + s + u. \quad (15.4)$$

Solving for  $\cos \theta$ , we get

$$\cos \theta = \frac{2\bar{x}E^2 + t - s - u}{2\bar{x}p\bar{p}}. \quad (15.5)$$

We can compute  $\sin^2 \theta$  numerically as  $\sin^2 \theta = 1 - \cos^2 \theta$ , but it is important to reexpress this in view of numerical stability. To this end, we first determine the bounds for  $t$ . The cosine must be between  $-1$  and  $1$ , so the bounds are

$$t_0 = -2\bar{x}(E^2 + p\bar{p}) + s + u, \quad (15.6)$$

$$t_1 = -2\bar{x}(E^2 - p\bar{p}) + s + u. \quad (15.7)$$

Computing  $\sin^2 \theta$  from  $\cos \theta$  above, we observe that the numerator is a quadratic polynomial in  $t$  which has the zeros  $t_0$  and  $t_1$ , while the common denominator is given by  $(2\bar{x}p\bar{p})^2$ . Hence, we can write

$$\sin^2 \theta = -\frac{(t - t_0)(t - t_1)}{(2\bar{x}p\bar{p})^2} \quad \text{and} \quad \cos \theta = \frac{(t - t_0) + (t - t_1)}{4\bar{x}p\bar{p}}, \quad (15.8)$$

which is free of large cancellations near  $t = t_0$  or  $t = t_1$ .

If all is massless, i.e.,  $s = u = 0$ , this simplifies to

$$t_0 = -4\bar{x}E^2, \quad t_1 = 0, \quad (15.9)$$

$$\sin^2 \theta = -\frac{t}{\bar{x}E^2} \left( 1 + \frac{t}{4\bar{x}E^2} \right), \quad \cos \theta = 1 + \frac{t}{2\bar{x}E^2}. \quad (15.10)$$

Here is the implementation. First, we define a container for the kinematical integration limits and some further data.

Note: contents are public only for easy access in unit test.

  end subroutine splitting_data_write

```

### 15.3.2 Constant data

This is the initializer for the data. The input consists of the incoming momentum, its invariant mass squared, and the invariant mass squared of the radiated particle.  $m2$  is the *physical* mass squared of the outgoing particle. The  $t$  bounds depend on the chosen  $x$  value and cannot be determined yet.

```

<SF aux: splitting data: TBP>+≡
  procedure :: init => splitting_data_init
<SF aux: procedures>+≡
  subroutine splitting_data_init (d, k, mk2, mr2, mo2, collinear)

```

```

class(splitting_data_t), intent(out) :: d
type(vector4_t), intent(in) :: k
real(default), intent(in) :: mk2, mr2, mo2
logical, intent(in), optional :: collinear
if (present (collinear)) d%collinear = collinear
d%E = energy (k)
d%x1 = 1 - sqrt (max (mr2, 0._default)) / d%E
d%p = sqrt (d%E**2 - mk2)
d%s = mk2
d%u = mr2
d%m2 = mo2
end subroutine splitting_data_init

```

Retrieve the  $x$  bounds, if needed for  $x$  sampling. Generating an  $x$  value is done by the caller, since this is the part that depends on the nature of the structure function.

```

⟨SF aux: splitting data: TBP⟩+≡
procedure :: get_x_bounds => splitting_get_x_bounds
⟨SF aux: procedures⟩+≡
function splitting_get_x_bounds (d) result (x)
class(splitting_data_t), intent(in) :: d
real(default), dimension(2) :: x
x = [ d%x0, d%x1 ]
end function splitting_get_x_bounds

```

Now set the momentum fraction and compute  $t_0$  and  $t_1$ .

[The calculation of  $t_1$  is subject to numerical problems. The exact formula is ( $s = m_i^2$ ,  $u = m_r^2$ )

$$t_1 = -2\bar{x}E^2 + m_i^2 + m_r^2 + 2\bar{x}\sqrt{E^2 - m_i^2}\sqrt{E^2 - m_r^2/\bar{x}^2}. \quad (15.11)$$

The structure-function paradigm is useful only if  $E \gg m_i, m_r$ . In a Taylor expansion for large  $E$ , the leading term cancels. The expansion of the square roots (to subleading order) yields

$$t_1 = xm_i^2 - \frac{x}{\bar{x}}m_r^2. \quad (15.12)$$

There are two cases of interest:  $m_i = m_o$  and  $m_r = 0$ ,

$$t_1 = xm_o^2 \quad (15.13)$$

and  $m_i = m_r$  and  $m_o = 0$ ,

$$t_1 = -\frac{x^2}{\bar{x}}m_i^2. \quad (15.14)$$

In both cases,  $t_1 \leq m_o^2$ ]

That said, it turns out that taking the  $t_1$  evaluation at face value leads to less problems than the approximation. We express the angles in terms of  $t - t_0$  and  $t - t_1$ . Numerical noise in  $t_1$  can then be tolerated.

```

⟨SF aux: splitting data: TBP⟩+≡
procedure :: set_t_bounds => splitting_set_t_bounds

```

```

⟨SF aux: procedures⟩+≡
  elemental subroutine splitting_set_t_bounds (d, x, xb)
    class(splitting_data_t), intent(inout) :: d
    real(default), intent(in), optional :: x, xb
    real(default) :: tp, tm
    if (present (x)) d%x = x
    if (present (xb)) d%xb = xb
    if (.not. vanishes (d%xb)) then
      d%pb = sqrt (max (d%E**2 - d%u / d%xb**2, 0._default))
    else
      d%pb = 0
    end if
    tp = -2 * d%xb * d%E**2 + d%s + d%u
    tm = -2 * d%xb * d%p * d%pb
    d%t0 = tp + tm
    d%t1 = tp - tm
    d%t = d%t1
  end subroutine splitting_set_t_bounds

```

### 15.3.3 Sampling recoil

Compute a value for the momentum transfer  $t$ , using a random number  $r$ . We assume a logarithmic distribution for  $t - m^2$ , corresponding to the propagator  $1/(t - m^2)$  with the physical mass  $m$  for the outgoing particle. Optionally, we can narrow the kinematical bounds.

If all three masses in the splitting vanish, the upper limit for  $t$  is zero. In that case, the  $t$  value is set to zero and the splitting will be collinear.

```

⟨SF aux: splitting data: TBP⟩+≡
  procedure :: sample_t => splitting_sample_t

⟨SF aux: procedures⟩+≡
  subroutine splitting_sample_t (d, r, t0, t1)
    class(splitting_data_t), intent(inout) :: d
    real(default), intent(in) :: r
    real(default), intent(in), optional :: t0, t1
    real(default) :: tt0, tt1, tt0m, tt1m
    if (d%collinear) then
      d%t = d%t1
    else
      tt0 = d%t0;  if (present (t0)) tt0 = max (t0, tt0)
      tt1 = d%t1;  if (present (t1)) tt1 = min (t1, tt1)
      tt0m = tt0 - d%m2
      tt1m = tt1 - d%m2
      if (tt0m < 0 .and. tt1m < 0 .and. abs(tt0m) > &
          epsilon(tt0m) .and. abs(tt1m) > epsilon(tt0m)) then
        d%t = d%m2 + tt0m * exp (r * log (tt1m / tt0m))
      else
        d%t = tt1
      end if
    end if
  end subroutine splitting_sample_t

```

The inverse operation: Given  $t$ , we recover the value of  $r$  that would have produced this value.

```
<SF aux: splitting data: TBP>+≡
    procedure :: inverse_t => splitting_inverse_t
(SF aux: procedures)+≡
    subroutine splitting_inverse_t (d, r, t0, t1)
        class(splitting_data_t), intent(in) :: d
        real(default), intent(out) :: r
        real(default), intent(in), optional :: t0, t1
        real(default) :: tt0, tt1, tt0m, tt1m
        if (d%collinear) then
            r = 0
        else
            tt0 = d%t0;  if (present (t0)) tt0 = max (t0, tt0)
            tt1 = d%t1;  if (present (t1)) tt1 = min (t1, tt1)
            tt0m = tt0 - d%m2
            tt1m = tt1 - d%m2
            if (tt0m < 0 .and. tt1m < 0) then
                r = log ((d%t - d%m2) / tt0m) / log (tt1m / tt0m)
            else
                r = 0
            end if
        end if
    end subroutine splitting_inverse_t
```

This is trivial, but provided for convenience:

```
<SF aux: splitting data: TBP>+≡
    procedure :: sample_phi => splitting_sample_phi
(SF aux: procedures)+≡
    subroutine splitting_sample_phi (d, r)
        class(splitting_data_t), intent(inout) :: d
        real(default), intent(in) :: r
        if (d%collinear) then
            d%phi = 0
        else
            d%phi = (1-r) * d%phi0 + r * d%phi1
        end if
    end subroutine splitting_sample_phi
```

Inverse:

```
<SF aux: splitting data: TBP>+≡
    procedure :: inverse_phi => splitting_inverse_phi
(SF aux: procedures)+≡
    subroutine splitting_inverse_phi (d, r)
        class(splitting_data_t), intent(in) :: d
        real(default), intent(out) :: r
        if (d%collinear) then
            r = 0
        else
            r = (d%phi - d%phi0) / (d%phi1 - d%phi0)
        end if
```

```
end subroutine splitting_inverse_phi
```

### 15.3.4 Splitting

In this function, we actually perform the splitting. The incoming momentum  $k$  is split into (if no recoil)  $q_1 = (1 - x)k$  and  $q_2 = xk$ .

Apart from the splitting data, we need the incoming momentum  $k$ , the momentum transfer  $t$ , and the azimuthal angle  $\phi$ . The momentum fraction  $x$  is already known here.

Alternatively, we can split without recoil. The azimuthal angle is irrelevant, and the momentum transfer is always equal to the upper limit  $t_1$ , so the polar angle is zero. Obviously, if there are nonzero masses it is not possible to keep both energy-momentum conservation and at the same time all particles on shell. We choose for dropping the on-shell condition here.

```
(SF aux: splitting data: TBP)+≡
procedure :: split_momentum => splitting_split_momentum
(SF aux: procedures)+≡
function splitting_split_momentum (d, k) result (q)
  class(splitting_data_t), intent(in) :: d
  type(vector4_t), dimension(2) :: q
  type(vector4_t), intent(in) :: k
  real(default) :: st2, ct2, st, ct, cp, sp
  type(lorentz_transformation_t) :: rot
  real(default) :: tt0, tt1, den
  type(vector3_t) :: kk, q1, q2
  if (d%collinear) then
    if (vanishes(d%s) .and. vanishes(d%u)) then
      q(1) = d%xb * k
      q(2) = d%x * k
    else
      kk = space_part (k)
      q1 = d%xb * (d%pb / d%p) * kk
      q2 = kk - q1
      q(1) = vector4_moving (d%xb * d%E, q1)
      q(2) = vector4_moving (d%x * d%E, q2)
    end if
  else
    den = 2 * d%xb * d%p * d%pb
    tt0 = max (d%t - d%t0, 0._default)
    tt1 = min (d%t - d%t1, 0._default)
    if (den**2 <= epsilon(den)) then
      st2 = 1
    else
      st2 = - (tt0 * tt1) / den ** 2
    end if
    if (st2 > 1) then
      st2 = 1
    end if
    ct2 = 1 - st2
    st = sqrt (max (st2, 0._default))
    ct = sqrt (max (ct2, 0._default))
```

```

    sp = sin (d%phi)
    cp = cos (d%phi)
    rot = rotation_to_2nd (3, space_part (k))
    q1 = vector3_moving (d%xb * d%pb * [st * cp, st * sp, ct])
    q2 = vector3_moving (d%p, 3) - q1
    q(1) = rot * vector4_moving (d%xb * d%E, q1)
    q(2) = rot * vector4_moving (d%x * d%E, q2)
  end if
end function splitting_split_momentum

```

Momenta generated by splitting will in general be off-shell. They are on-shell only if they are collinear and massless. This subroutine puts them on shell by brute force, violating either momentum or energy conservation. The direction of three-momentum is always retained.

If the energy is below mass shell, we return a zero momentum.

```

<SF aux: parameters>≡
  integer, parameter, public :: KEEP_ENERGY = 0, KEEP_MOMENTUM = 1
<SF aux: public>+≡
  public :: on_shell
<SF aux: procedures>+≡
  elemental subroutine on_shell (p, m2, keep)
    type(vector4_t), intent(inout) :: p
    real(default), intent(in) :: m2
    integer, intent(in) :: keep
    real(default) :: E, E2, pn
    select case (keep)
    case (KEEP_ENERGY)
      E = energy (p)
      E2 = E ** 2
      if (E2 >= m2) then
        pn = sqrt (E2 - m2)
        p = vector4_moving (E, pn * direction (space_part (p)))
      else
        p = vector4_null
      end if
    case (KEEP_MOMENTUM)
      E = sqrt (space_part (p) ** 2 + m2)
      p = vector4_moving (E, space_part (p))
    end select
  end subroutine on_shell

```

### 15.3.5 Recovering the splitting

This is the inverse problem. We have on-shell momenta and want to deduce the splitting parameters  $x$ ,  $t$ , and  $\phi$ .

```

<SF aux: splitting data: TBP>+≡
  procedure :: recover => splitting_recover
<SF aux: procedures>+≡
  subroutine splitting_recover (d, k, q, keep)
    class(splitting_data_t), intent(inout) :: d

```

```

type(vector4_t), intent(in) :: k, q
integer, intent(in) :: keep
type(lorentz_transformation_t) :: rot
type(vector4_t) :: q0, k0
real(default) :: p1, p2, p3, pt2, pp2, pl
real(default) :: aux, den, norm
real(default) :: st2, ct2, ct
rot = inverse (rotation_to_2nd (3, space_part (k)))
q0 = rot * q
p1 = vector4_get_component (q0, 1)
p2 = vector4_get_component (q0, 2)
p3 = vector4_get_component (q0, 3)
pt2 = p1 ** 2 + p2 ** 2
pp2 = p1 ** 2 + p2 ** 2 + p3 ** 2
pl = abs (p3)
k0 = vector4_moving (d%E, d%p, 3)
select case (keep)
case (KEEP_ENERGY)
    d%x = energy (q0) / d%E
    d%xb = 1 - d%x
    call d%set_t_bounds ()
    if (.not. d%collinear) then
        aux = (d%xb * d%pb) ** 2 * pp2 - d%p ** 2 * pt2
        den = d%p ** 2 - (d%xb * d%pb) ** 2
        if (aux >= 0 .and. den > 0) then
            norm = (d%p * pl + sqrt (aux)) / den
        else
            norm = 1
        end if
    end if
case (KEEP_MOMENTUM)
    d%xb = sqrt (space_part (k0 - q0) ** 2 + d%u) / d%E
    d%x = 1 - d%xb
    call d%set_t_bounds ()
    norm = 1
end select
if (d%collinear) then
    d%t = d%t1
    d%phi = 0
else
    if ((d%xb * d%pb * norm)**2 < epsilon(d%xb)) then
        st2 = 1
    else
        st2 = pt2 / (d%xb * d%pb * norm ) ** 2
    end if
    if (st2 > 1) then
        st2 = 1
    end if
    ct2 = 1 - st2
    ct = sqrt (max (ct2, 0._default))
    if (.not. vanishes (1 + ct)) then
        d%t = d%t1 - 2 * d%xb * d%p * d%pb * st2 / (1 + ct)
    else
        d%t = d%t0
    end if
end if

```

```

    end if
    if (.not. vanishes (p1) .or. .not. vanishes (p2)) then
        d%phi = atan2 (-p2, -p1)
    else
        d%phi = 0
    end if
end if
end subroutine splitting_recover

```

### 15.3.6 Extract data

```

⟨SF aux: splitting data: TBP⟩+≡
    procedure :: get_x => splitting_get_x
⟨SF aux: procedures⟩+≡
    function splitting_get_x (sd) result (x)
        class(splitting_data_t), intent(in) :: sd
        real(default) :: x
        x = sd%x
    end function splitting_get_x

```

### 15.3.7 Unit tests

Test module, followed by the corresponding implementation module.

⟨SF aux: test driver⟩≡
subroutine sf_aux_test (u, results)
integer, intent(in) :: u
type(test_results_t), intent(inout) :: results
⟨SF aux: execute tests⟩
end subroutine sf_aux_test

```

**Momentum splitting: massless radiation**

Compute momentum splitting for generic kinematics. It turns out that for  $x = 0.5$ , where  $t - m^2$  is the geometric mean between its upper and lower bounds (this can be directly seen from the logarithmic distribution in the function `sample_t` for  $r \equiv x = 1 - x = 0.5$ ), we arrive at an exact number  $t = -0.15$  for the given input values.

```

### Momentum splitting: massless parton

Compute momentum splitting for generic kinematics. It turns out that for  $x = 0.5$ , where  $t - m^2$  is the geometric mean between its upper and lower bounds, we arrive at an exact number  $t = -0.36$  for the given input values.

```

## 15.4 Mappings for structure functions

In this module, we provide a wrapper for useful mappings of the unit (hyper-)square that we can apply to a set of structure functions.

In some cases it is useful, or even mandatory, to map the MC input parameters nontrivially onto a set of structure functions for the two beams. In all cases considered here, instead of  $x_1, x_2, \dots$  as parameters for the beams, we generate one parameter that is equal, or related to, the product  $x_1 x_2 \dots$  (so it directly corresponds to  $\sqrt{s}$ ). The other parameters describe the distribution of energy (loss) between beams and radiations.

```

<sf_mappings.f90>≡
  <File header>

```

```
module sf_mappings
```

```

⟨Use kinds⟩
  use kinds, only: double
  use io_units
  use constants, only: pi, zero, one
  use unit_tests, only: vanishes
  use diagnostics

⟨Standard module head⟩

⟨SF mappings: public⟩

⟨SF mappings: parameters⟩

⟨SF mappings: types⟩

⟨SF mappings: interfaces⟩

contains

⟨SF mappings: procedures⟩

end module sf_mappings

```

#### 15.4.1 Base type

First, we define an abstract base type for the mapping. In all cases we need to store the indices of the parameters on which the mapping applies. Additional parameters can be stored in the extensions of this type.

```

⟨SF mappings: public⟩≡
  public :: sf_mapping_t

⟨SF mappings: types⟩≡
  type, abstract :: sf_mapping_t
    integer, dimension(:), allocatable :: i
  contains
    ⟨SF mappings: sf mapping: TBP⟩
  end type sf_mapping_t

```

The output routine is deferred:

```

⟨SF mappings: sf mapping: TBP⟩≡
  procedure (sf_mapping_write), deferred :: write

⟨SF mappings: interfaces⟩≡
  abstract interface
    subroutine sf_mapping_write (object, unit)
      import
      class(sf_mapping_t), intent(in) :: object
      integer, intent(in), optional :: unit
    end subroutine sf_mapping_write
  end interface

```

Initializer for the base type. The array of parameter indices is allocated but initialized to zero.

```
<SF mappings: sf mapping: TBP>+≡
procedure :: base_init => sf_mapping_base_init
<SF mappings: procedures>+≡
subroutine sf_mapping_base_init (mapping, n_par)
  class(sf_mapping_t), intent(out) :: mapping
  integer, intent(in) :: n_par
  allocate (mapping%i (n_par))
  mapping%i = 0
end subroutine sf_mapping_base_init
```

Set an index value.

```
<SF mappings: sf mapping: TBP>+≡
procedure :: set_index => sf_mapping_set_index
<SF mappings: procedures>+≡
subroutine sf_mapping_set_index (mapping, j, i)
  class(sf_mapping_t), intent(inout) :: mapping
  integer, intent(in) :: j, i
  mapping%i(j) = i
end subroutine sf_mapping_set_index
```

Return the dimensionality, i.e., the number of parameters.

```
<SF mappings: sf mapping: TBP>+≡
procedure :: get_n_dim => sf_mapping_get_n_dim
<SF mappings: procedures>+≡
function sf_mapping_get_n_dim (mapping) result (n)
  class(sf_mapping_t), intent(in) :: mapping
  integer :: n
  n = size (mapping%i)
end function sf_mapping_get_n_dim
```

Computation: the values **p** are the input parameters, the values **r** are the output parameters. The values **rb** are defined as  $\bar{r} = 1 - r$ , but provided explicitly. They allow us to avoid numerical problems near  $r = 1$ .

The extra parameter **x\_free** indicates that the total energy has already been renormalized by this factor. We have to take such a factor into account in a resonance or on-shell mapping.

The Jacobian is **f**. We modify only the two parameters indicated by the indices **i**.

```
<SF mappings: sf mapping: TBP>+≡
procedure (sf_mapping_compute), deferred :: compute
<SF mappings: interfaces>+≡
abstract interface
  subroutine sf_mapping_compute (mapping, r, rb, f, p, pb, x_free)
    import
    class(sf_mapping_t), intent(inout) :: mapping
    real(default), dimension(:), intent(out) :: r, rb
    real(default), intent(out) :: f
```

```

    real(default), dimension(:), intent(in) :: p, pb
    real(default), intent(inout), optional :: x_free
end subroutine sf_mapping_compute
end interface

```

The inverse mapping. Use `r` and/or `rb` to reconstruct `p` and also compute `f`.

```

⟨SF mappings: sf mapping: TBP⟩+≡
procedure (sf_mapping_inverse), deferred :: inverse
⟨SF mappings: interfaces⟩+≡
abstract interface
subroutine sf_mapping_inverse (mapping, r, rb, f, p, pb, x_free)
import
class(sf_mapping_t), intent(inout) :: mapping
real(default), dimension(:), intent(in) :: r, rb
real(default), intent(out) :: f
real(default), dimension(:), intent(out) :: p, pb
real(default), intent(inout), optional :: x_free
end subroutine sf_mapping_inverse
end interface

```

#### 15.4.2 Methods for self-tests

This is a shorthand for: inject parameters, compute the mapping, display results, compute the inverse, display again. We provide an output format for the parameters and, optionally, a different output format for the Jacobians.

```

⟨SF mappings: sf mapping: TBP⟩+≡
procedure :: check => sf_mapping_check
⟨SF mappings: procedures⟩+≡
subroutine sf_mapping_check (mapping, u, p_in, pb_in, fmt_p, fmt_f)
class(sf_mapping_t), intent(inout) :: mapping
integer, intent(in) :: u
real(default), dimension(:), intent(in) :: p_in, pb_in
character(*), intent(in) :: fmt_p
character(*), intent(in), optional :: fmt_f
real(default), dimension(size(p_in)) :: p, pb, r, rb
real(default) :: f, tolerance
tolerance = 1.5E-17
p = p_in
pb= pb_in
call mapping%compute (r, rb, f, p, pb)
call pacify (p, tolerance)
call pacify (pb, tolerance)
call pacify (r, tolerance)
call pacify (rb, tolerance)
write (u, "(3x,A,9(1x," // fmt_p // "))") "p =", p
write (u, "(3x,A,9(1x," // fmt_p // "))") "pb=", pb
write (u, "(3x,A,9(1x," // fmt_p // "))") "r =", r
write (u, "(3x,A,9(1x," // fmt_p // "))") "rb=", rb
if (present (fmt_f)) then
    write (u, "(3x,A,9(1x," // fmt_f // "))") "f =", f

```

```

else
    write (u, "(3x,A,9(1x," // fmt_p // "))") "f =", f
end if
write (u, *)
call mapping%inverse (r, rb, f, p, pb)
call pacify (p, tolerance)
call pacify (pb, tolerance)
call pacify (r, tolerance)
call pacify (rb, tolerance)
write (u, "(3x,A,9(1x," // fmt_p // "))") "p =", p
write (u, "(3x,A,9(1x," // fmt_p // "))") "pb=", pb
write (u, "(3x,A,9(1x," // fmt_p // "))") "r =", r
write (u, "(3x,A,9(1x," // fmt_p // "))") "rb=", rb
if (present (fmt_f)) then
    write (u, "(3x,A,9(1x," // fmt_f // "))") "f =", f
else
    write (u, "(3x,A,9(1x," // fmt_p // "))") "f =", f
end if
write (u, *)
write (u, "(3x,A,9(1x," // fmt_p // "))") "*r=", product (r)
end subroutine sf_mapping_check

```

This is a consistency check for the self-tests: the integral over the unit square should be unity. We estimate this by a simple binning and adding up the values; this should be sufficient for a self-test.

The argument is the requested number of sampling points. We take the square root for binning in both dimensions, so the precise number might be different.

```

⟨SF mappings: sf mapping: TBP⟩+≡
procedure :: integral => sf_mapping_integral
⟨SF mappings: procedures⟩+≡
function sf_mapping_integral (mapping, n_calls) result (integral)
    class(sf_mapping_t), intent(inout) :: mapping
    integer, intent(in) :: n_calls
    real(default) :: integral
    integer :: n_dim, n_bin, k
    real(default), dimension(:), allocatable :: p, pb, r, rb
    integer, dimension(:), allocatable :: ii
    real(default) :: dx, f, s

    n_dim = mapping%get_n_dim ()
    allocate (p (n_dim))
    allocate (pb(n_dim))
    allocate (r (n_dim))
    allocate (rb(n_dim))
    allocate (ii(n_dim))
    n_bin = nint (real (n_calls, default) ** (1._default / n_dim))
    dx = 1._default / n_bin
    s = 0
    ii = 1

    SAMPLE: do
        do k = 1, n_dim

```

```

    p(k) = ii(k) * dx - dx/2
    pb(k) = (n_bin - ii(k)) * dx + dx/2
end do
call mapping%compute (r, rb, f, p, pb)
s = s + f
INCR: do k = 1, n_dim
    ii(k) = ii(k) + 1
    if (ii(k) <= n_bin) then
        exit INCR
    else if (k < n_dim) then
        ii(k) = 1
    else
        exit SAMPLE
    end if
end do INCR
end do SAMPLE

integral = s / real (n_bin, default) ** n_dim

end function sf_mapping_integral

```

### 15.4.3 Implementation: standard mapping

This maps the unit square  $(r_1, r_2)$  such that  $p_1$  is the product  $r_1 r_2$ , while  $p_2$  is related to the ratio.

```

⟨SF mappings: public⟩+≡
public :: sf_s_mapping_t
⟨SF mappings: types⟩+≡
type, extends (sf_mapping_t) :: sf_s_mapping_t
