        call process%mci_entry(i_mci)%generate_unweighted_event (instance)
    end subroutine process_generate_unweighted_event

```

This replaces the event generation methods for the situation that the process instance object has been filled by other means (i.e., reading and/or recalculating its contents). We just have to fill in missing MCI data, especially the event weight.

```

⟨Processes: process: TBP⟩+≡

    end function process_get_md5sum_cfg

```

### 28.3.2 Metadata

This information describes the process and its environment. It is fixed upon initialization.

The `id` string is the name of the process object, as given by the user. The matrix element generator will use this string for naming Fortran procedures and types, so it should qualify as a Fortran name.

The `num_id` is meaningful if nonzero. It is used for communication with external programs or file standards which do not support string IDs.

The `run_id` string distinguishes among several runs for the same process. It identifies process instances with respect to adapted integration grids and similar run-specific data. The run ID is kept when copying processes for creating instances, however, so it does not distinguish event samples.

The `var_list` is a snapshot of the variable list, taken at the point where the process was initialized.

The `lib` pointer accesses the process library where the process definition and the process driver are located.

The `lib_index` is the index of entry in the process library that corresponds to the current process.

The `component_id` array identifies the individual process components.

The `component_description` is an array of human-readable strings that characterize the process components, for instance `a, b => c, d`.

The `active` mask array marks those components which are active. The others are skipped.

### 28.3.3 Generic Configuration Data

This information concerns physical and technical properties of the process. It is fixed upon initialization, using data from the process specification and the variable list.

The number `n_in` is the number of incoming beam particles, simultaneously the number of incoming partons, 1 for a decay and 2 for a scattering process. (The number of outgoing partons may depend on the process component.)

The number `n_components` is the number of components that constitute the current process.

The number `n_terms` is the number of distinct contributions to the scattering matrix that constitute the current process. Each component may generate several terms.

The number `n_mci` is the number of independent MC integration configurations that this process uses. Distinct process components that share a MC configuration may be combined pointwise. (Nevertheless, a given MC variable set may correspond to several “nearby” kinematical configurations.) This is also the number of distinct sampling-function results that this process can generate. Process components that use distinct variable sets are added only once after an integration pass has completed.

The `model` pointer identifies the physics model and its parameters. This is a pointer to an external object.

The `rng_factory` component spawns independent random-number generators for use in integration, event generation, and event postprocessing.

Various `parse_node_t` objects are taken from the SINDARIN input. They encode expressions for evaluating cuts and scales. The workspaces for evaluating those expressions are set up in the `effective_state` subobjects. Note that these are really pointers, so the actual nodes are not stored inside the process object.

The `md5sum` is taken and used to verify the process configuration when re-reading data from file.

```

<Processes: process part types>+≡
type :: process_config_data_t

        call write_separator (u)
        write (u, "(3x,A,A,A)") "MD5 sum (config) = '", config%md5sum, "'"
    end if
end subroutine process_config_data_write

```

Initialize. We use information from the process metadata and from the process library, given the process ID. We also store the currently active OS data set.

The model that we import here should be an instance of the global model. If we create the instance outside, we can make it an extension of the basic `model_data_t`. This will allow us to synchronize the variable list with the model. Using a pointer instead of an allocatable, we can guarantee the `target` attribute.

The RNG factory object is imported by moving the allocation.

```

⟨Processes: process config data: TBP⟩+≡
procedure :: init => process_config_data_init
⟨Processes: procedures⟩+≡
subroutine process_config_data_init &
  (config, meta, os_data, qcd, rng_factory, model)
  class(process_config_data_t), intent(out) :: config

```

```

type(process_metadata_t), intent(in) :: meta
type(os_data_t), intent(in) :: os_data
type(qcd_t), intent(in) :: qcd
class(rng_factory_t), intent(inout), allocatable :: rng_factory
class(model_data_t), intent(inout), pointer :: model
config%n_in = meta%lib%get_n_in (meta%id)
config%n_components = size (meta%component_id)
config%os_data = os_data
config%qcd = qcd
call move_alloc (from = rng_factory, to = config%rng_factory)
config%model_name = model%get_name ()
config%model => model
model => null ()
end subroutine process_config_data_init

```

Since the captured model is a separate object allocated via a pointer, we need a finalizer.

```

⟨Processes: process config data: TBP⟩+≡
procedure :: final => process_config_data_final
⟨Processes: procedures⟩+≡
subroutine process_config_data_final (config)
  class(process_config_data_t), intent(inout) :: config
  if (associated (config%model)) then
    call config%model%final ()
    deallocate (config%model)
  end if
end subroutine process_config_data_final

```

Compute the MD5 sum of the configuration data. This encodes, in particular, the model and the expressions for cut, scales, weight, etc. It should not contain the IDs and number of components, etc., since the MD5 sum should be useful for integrating individual components.

This is done only once. If the MD5 sum is nonempty, the calculation is skipped.

```

⟨Processes: process config data: TBP⟩+≡
procedure :: compute_md5sum => process_config_data_compute_md5sum
⟨Processes: procedures⟩+≡
subroutine process_config_data_compute_md5sum (config)

  if (config%md5sum == "") then
    u = free_unit ()
    open (u, status = "scratch", action = "readwrite")
    call config%write (u, counters = .false., os_data = .false., &
                      rng_factory = .false., model = .true., expressions = .true.)
    rewind (u)
    config%md5sum = md5sum (u)
    close (u)
  end if
end subroutine process_config_data_compute_md5sum

```

### 28.3.4 Beam configuration

The object `data` holds all details about the initial beam configuration. The allocatable array `sf` holds the structure-function configuration blocks. There are `n_strfun` entries in the structure-function chain (not counting the initial beam object). We maintain `n_channel` independent parameterizations of this chain. If this is greater than zero, we need a multi-channel sampling algorithm, where for each point one channel is selected to generate kinematics.

The number of parameters that are required for generating a structure-function chain is `n_sfpar`.

The flag `azimuthal_dependence` tells whether the process setup is symmetric about the beam axis in the c.m. system. This implies that there is no transversal beam polarization. The flag `lab_is_cm_frame` is obvious.

```
(Processes: process part types)+≡
type :: process_beam_config_t
    private
    type(bean_data_t) :: data
    integer :: n_strfun = 0
    integer :: n_channel = 1
    integer :: n_sfpar = 0
    type(sf_config_t), dimension(:), allocatable :: sf
    type(sf_channel_t), dimension(:), allocatable :: sf_channel
    logical :: azimuthal_dependence = .false.
    logical :: lab_is_cm_frame = .true.
    character(32) :: md5sum = ""
    logical :: sf_trace = .false.
    type(string_t) :: sf_trace_file
contains
(Processes: process beam config: TBP)
end type process_beam_config_t
```

Here we write beam data only if they are actually used.

```
(Processes: process beam config: TBP)≡
procedure :: write => process_beam_config_write
(Processes: procedures)+≡
subroutine process_beam_config_write (object, u)

### 28.3.5 Multi-channel integration

The `process_mci_entry_t` block contains, for each process component that is integrated independently, the configuration data for its MC input parameters. Each input parameter set is handled by a `mci_t` integrator.

The MC input parameter set is broken down into the parameters required by the structure-function chain and the parameters required by the phase space of the elementary process.

The MD5 sum collects all information about the associated processes that may affect the integration. It does not contain the MCI object itself or integration results.

MC integration is organized in passes. Each pass may consist of several iterations, and for each iteration there is a number of calls. We store explicitly the values that apply to the current pass. Previous values are archived in the `results` object.

The `counter` receives the counter statistics from the associated process instance, for diagnostics.

The `results` object records results, broken down in passes and iterations.

```

```

```

call mci_entry%mci%sampler_test (instance, n_calls)
mci_entry%counter = instance%get_counter ()
end subroutine process_mci_entry_sampler_test

```

Integrate. The instance should be initialized.

The `integrate` method counts as an integration pass; the pass count is increased by one. We transfer the pass parameters (number of iterations and number of calls) to the actual integration routine.

The `mci_entry` is `intent(inout)` because the integrator contains the random-number state.

Note: The results are written to screen and to logfile. This behavior is hardcoded.

Generate an event. The instance should be initialized, otherwise event generation is directed by the mci integrator subobject. The integrator instance is contained in a mci\_work subobject of the process instance, which simultaneously serves as the sampler object. (We avoid the anti-aliasing rules if we assume that the sampling itself does not involve the integrator instance contained in the process instance.)

Regarding weighted events, we only take events which are valid, which means that they have valid kinematics and have passed cuts. Therefore, we have a rejection loop. For unweighted events, the unweighting routine should already take care of this.

    md5sum = entry%mci%get_md5sum ()
end function process_mci_entry_get_md5sum
```

### 28.3.6 Process Components

A process component is an individual contribution to a process (scattering or decay) which needs not be physical. The sum over all components should be physical.

The `index` identifies this component within its parent process.

The actual process component is stored in the `core` subobject. We use a polymorphic subobject instead of an extension of `process_component_t`, because the individual entries in the array of process components can have different types. In short, `process_component_t` is a wrapper for the actual process variants.

If the `active` flag is false, we should skip this component. This happens if the associated process has vanishing matrix element.

The index array `i_term` points to the individual terms generated by this component. The indices refer to the parent process.

The index `i_mci` is the index of the MC integrator and parameter set which are associated to this process component.

```
(Processes: process part types) +≡
type :: process_component_t
    private
        type(process_component_def_t), pointer :: config => null ()
        integer :: index = 0
        class(prc_core_t), allocatable :: core
        class(prc_core_t), pointer :: core_sub_born
        logical :: active = .false.
        class(mci_t), allocatable :: mci_template
        integer, dimension(:, ), allocatable :: i_term
        integer :: i_mci = 0
        class(phs_config_t), allocatable :: phs_config
        character(32) :: md5sum_phs = ""
        type(fks_template_t) :: fks_template
        integer :: component_type = COMP_DEFAULT
contains
    (Processes: process component: TBP)
end type process_component_t
```

Finalizer. The MCI template may (potentially) need a finalizer. The process configuration finalizer may include closing an open scratch file.

```
(Processes: process component: TBP)≡
procedure :: final => process_component_final
(Processes: procedures)+≡
subroutine process_component_final (object)
  class(process_component_t), intent(inout) :: object
  if (allocated (object%mci_template)) then
    call object%mci_template%final ()
  end if
  if (allocated (object%phs_config)) then
    call object%phs_config%final ()
  end if
end subroutine process_component_final
```

The meaning of `verbose` depends on the process variant.

```

```

### 28.3.7 Process terms

For straightforward tree-level calculations, each process component corresponds to a unique elementary interaction. However, in the case of NLO calculations with subtraction terms, a process component may split into several separate contributions to the scattering, which are qualified by interactions with distinct kinematics and particle content. We represent their configuration as `process_term_t` objects, the actual instances will be introduced below as `term_instance_t`. In any case, the process term contains an elementary interaction with a definite quantum-number and momentum content.

The index `i_term_global` identifies the term relative to the process.

The index `i_component` identifies the process component which generates this term, relative to the parent process.

The index `i_term` identifies the term relative to the process component (not the process).

The `data` subobject holds all process constants.

The number of allowed flavor/helicity/color combinations is stored as `n_allowed`. This is the total number of independent entries in the density matrix. For each combination, the index of the flavor, helicity, and color state is stored in the arrays `flv`, `hel`, and `col`, respectively.

The flag `rearrange` is true if we need to rearrange the particles of the hard interaction, to obtain the effective parton state.

The interaction `int` holds the quantum state for the (resolved) hard interaction, the parent-child relations of the particles, and their momenta. The momenta are not filled yet; this is postponed to copies of `int` which go into the process instances.

If recombination is in effect, we should allocate `int_eff` to describe the rearranged partonic state.

This type is public only for use in a unit test.

```

⟨Processes: public⟩+≡
  public :: process_term_t

⟨Processes: process part types⟩+≡
  type :: process_term_t
    integer :: i_term_global = 0
    integer :: i_component = 0
    integer :: i_term = 0

```

```

integer :: n_allowed = 0
integer :: n_allowed_sub_born = 0
type(process_constants_t) :: data
real(default) :: alpha_s = 0
integer, dimension(:), allocatable :: flv, hel, col
logical :: rearrange = .false.
type(interaction_t) :: int
type(interaction_t), pointer :: int_eff => null ()
contains
<Processes: process term: TBP>
end type process_term_t

```

For the output, we skip the process constants and the tables of allowed quantum numbers. Those can also be read off from the interaction object.

```

<Processes: process term: TBP>≡
procedure :: write => process_term_write
<Processes: procedures>+≡
subroutine process_term_write (term, unit)
class(process_term_t), intent(in) :: term
integer, intent(in), optional :: unit
integer :: u
u = given_output_unit (unit)
write (u, "(1x,A,IO)") "Term #", term%i_term_global
write (u, "(3x,A,IO)") "Process component index      = ", &
    term%i_component
write (u, "(3x,A,IO)") "Term index w.r.t. component = ", &
    term%i_term
write (u, "(3x,A,L1)") "Rearrange partons           = ", &
    term%rearrange
call write_separator (u)
write (u, "(1x,A)") "Hard interaction:"

    call write_separator (u)
    call term%int_eff%basic_write (u)
end if
end subroutine process_term_write

```

Write an account of all quantum number states and their current status.

```

<Processes: process term: TBP>+≡
procedure :: write_state_summary => process_term_write_state_summary
<Processes: procedures>+≡
subroutine process_term_write_state_summary (term, core, unit)
class(process_term_t), intent(in) :: term
class(prc_core_t), intent(in) :: core
integer, intent(in), optional :: unit
integer :: u, i, f, h, c
type(state_iterator_t) :: it
character :: sgn

```

```

u = given_output_unit (unit)
write (u, "(1x,A,IO)") "Term #", term%i_term_global
call it%init (term%int%get_state_matrix_ptr ())
do while (it%is_valid ())
    i = it%get_me_index ()
    f = term%flv(i)
    h = term%hel(i)
    c = term%col(i)
    if (core%is_allowed (term%i_term, f, h, c)) then
        sgn = "+"
    else
        sgn = " "
    end if
    write (u, "(1x,A1,1x,I0,2x)", advance="no") sgn, i
    call quantum_numbers_write (it%get_quantum_numbers (), u)
    write (u, *)
    call it%advance ()
end do
end subroutine process_term_write_state_summary

```

Finalizer: the `int` and potentially `int_eff` components have a finalizer that we must call.

```

⟨Processes: process term: TBP⟩+≡
procedure :: final => process_term_final
⟨Processes: procedures⟩+≡
subroutine process_term_final (term)
    class(process_term_t), intent(inout) :: term
    call term%int%final ()
    if (term%rearrange) then
        call term%int_eff%final ()
        deallocate (term%int_eff)
    end if
end subroutine process_term_final

```

Initialize the term. We copy the process constants from the `core` object and set up the `int` hard interaction accordingly.

The `alpha_s` value is useful for writing external event records. This is the constant value which may be overridden by a event-specific running value. If the model does not contain the strong coupling, the value is zero.

The `rearrange` part is commented out; this or something equivalent could become relevant for NLO algorithms.

```

⟨Processes: process term: TBP⟩+≡
procedure :: init => process_term_init
⟨Processes: procedures⟩+≡
subroutine process_term_init &
    (term, i_term_global, i_component, i_term, core, model)
    class(process_term_t), intent(inout), target :: term
    integer, intent(in) :: i_term_global
    integer, intent(in) :: i_component
    integer, intent(in) :: i_term
    class(prc_core_t), intent(in) :: core

```

```

    class(model_data_t), intent(in), target :: model
    class(modelpar_data_t), pointer :: alpha_s_ptr
!    type(var_list_t), pointer :: var_list
    term%i_term_global = i_term_global
    term%i_component = i_component
    term%i_term = i_term
    call core%get_constants (term%data, i_term)
!    var_list => model%get_var_list_ptr ()
!    if (var_list%contains (var_str ("alphas"))) then
!        term%alpha_s = var_list%get_rval (var_list, var_str ("alphas"))
!    else
!        term%alpha_s = -1
!    end if
    alpha_s_ptr => model%get_par_data_ptr (var_str ("alphas"))
    if (associated (alpha_s_ptr)) then
        term%alpha_s = alpha_s_ptr%get_real ()
    else
        term%alpha_s = -1
    end if

    call term%setup_interaction (core, model)
!    if (term%rearrange) then
!        call term%setup_effective_interaction (core, term%int, term%int_eff)
!    end if
end subroutine process_term_init

```

We fetch the process constants which determine the quantum numbers and use those to create the interaction. The interaction contains incoming and outgoing particles, no virtuals. The incoming particles are parents of the outgoing ones.

Keeping previous WHIZARD conventions, we invert the color assignment (but not flavor or helicity) for the incoming particles. When the color-flow square matrix is evaluated, this inversion is done again, so in the color-flow sequence we get the color assignments of the matrix element.

```

### 28.3.8 Default Iterations

If the user does not specify the passes and iterations for integration, we should be able to give reasonable defaults. These depend on the process, therefore we implement the following procedures as methods of the process object. The

algorithm is not very sophisticated yet, it may be improved by looking at the process in more detail.

We investigate only the first process component, assuming that it characterizes the complexity of the process reasonable well.

The number of passes is limited to two: one for adaption, one for integration.

```

⟨Processes: process: TBP⟩+≡
procedure :: get_n_pass_default => process_get_n_pass_default
procedure :: adapt_grids_default => process_adapt_grids_default
procedure :: adapt_weights_default => process_adapt_weights_default

⟨Processes: procedures⟩+≡
function process_get_n_pass_default (process) result (n_pass)
    class(process_t), intent(in) :: process
    integer :: n_pass
    integer :: n_eff
    type(process_component_def_t), pointer :: config
    config => process%component(1)%config
    n_eff = config%get_n_tot () - 2
    select case (n_eff)
    case (1)
        n_pass = 1
    case default
        n_pass = 2
    end select
end function process_get_n_pass_default

function process_adapt_grids_default (process, pass) result (flag)
    class(process_t), intent(in) :: process
    integer, intent(in) :: pass
    logical :: flag
    integer :: n_eff

### 28.3.9 Constant process data

The following methods return basic process data that stay constant after initialization.

The process and IDs.

```

⟨Processes: process: TBP⟩+≡
procedure :: get_id => process_get_id
procedure :: get_num_id => process_get_num_id
procedure :: get_run_id => process_get_run_id
procedure :: get_library_name => process_get_library_name

⟨Processes: procedures⟩+≡
function process_get_id (process) result (id)
    class(process_t), intent(in) :: process
    type(string_t) :: id
    id = process%meta%id
end function process_get_id

function process_get_num_id (process) result (id)
    class(process_t), intent(in) :: process
    integer :: id
    id = process%meta%num_id
end function process_get_num_id

function process_get_run_id (process) result (id)
    class(process_t), intent(in) :: process
    type(string_t) :: id
    id = process%meta%run_id
end function process_get_run_id

function process_get_library_name (process) result (id)

```

```

    class(process_t), intent(in) :: process
    type(string_t) :: id
    id = process%meta%lib%get_name ()
end function process_get_library_name

```

The number of incoming particles.

```

<Processes: process: TBP>+≡
    procedure :: get_n_in => process_get_n_in
<Processes: procedures>+≡
    function process_get_n_in (process) result (n)
        class(process_t), intent(in) :: process
        integer :: n
        n = process%config%n_in
    end function process_get_n_in

```

The number of MCI data sets.

```

<Processes: process: TBP>+≡
    procedure :: get_n_mci => process_get_n_mci
<Processes: procedures>+≡
    function process_get_n_mci (process) result (n)
        class(process_t), intent(in) :: process
        integer :: n
        n = process%config%n_mci
    end function process_get_n_mci

```

The number of process components, total.

```

<Processes: process: TBP>+≡
    procedure :: get_n_components => process_get_n_components
<Processes: procedures>+≡
    function process_get_n_components (process) result (n)

        end if
    end subroutine process_make_rng

```

### 28.3.10 Compute an amplitude

Each process variant should allow for computing an amplitude value directly, without generating a process instance.

The process component is selected by the index *i*. The term within the process component is selected by *j*. The momentum combination is transferred

as the array `p`. The function sets the specific quantum state via the indices of a flavor `f`, helicity `h`, and color `c` combination. Each index refers to the list of flavor, helicity, and color states, respectively, as stored in the process data.

Optionally, we may set factorization and renormalization scale. If unset, the partonic c.m. energy is inserted.

The function checks arguments for validity. For invalid arguments (quantum states), we return zero.

```
<Processes: process: TBP>+≡
procedure :: compute_amplitude => process_compute_amplitude
<Processes: procedures>+≡
function process_compute_amplitude &
    (process, i, j, p, f, h, c, fac_scale, ren_scale, alpha_qcd_forced) &

#### Kinematics instance

In this data type we combine all objects (instances) necessary for generating (or recovering) a kinematical configuration. The components work together as an implementation of multi-channel phase space.

`sf_chain` is an instance of the structure-function chain. It is used both for generating kinematics and, after the proper scale has been determined, evaluating the structure function entries.

`phs` is an instance of the phase space for the elementary process.

The array `f` contains the products of the Jacobians that originate from parameter mappings in the structure-function chain or in the phase space. We allocate this explicitly if either `sf_chain` or `phs` are explicitly allocated, otherwise we can take over a pointer.

All components are implemented as pointers to (anonymous) targets. For each component, there is a flag that tells whether this component is to be regarded as a proper component ('owned' by the object) or as a pointer.

*(Processes: types)*+≡

```

type :: kinematics_t
    integer :: n_in = 0
    integer :: n_channel = 0
    integer :: selected_channel = 0
    type(sf_chain_instance_t), pointer :: sf_chain => null ()
    class(phs_t), pointer :: phs => null ()
    real(default), dimension(:), pointer :: f => null ()
    real(default) :: phs_factor
    logical :: sf_chain_allocated = .false.
    logical :: phs_allocated = .false.
    logical :: f_allocated = .false.
    integer :: nlo_type
    integer :: emitter
contains
    <i>(Processes: kinematics: TBP)</i>
end type kinematics_t

```

Output. Show only those components which are marked as owned.

*(Processes: kinematics: TBP)*≡

```

procedure :: write => kinematics_write
<i>(Processes: procedures)</i>+≡

    success = .false.
end if
end select
end subroutine kinematics_compute_selected_channel

```

Complete kinematics by filling the non-selected phase-space parameter arrays.

```
(Processes: kinematics: TBP) +≡
    procedure :: compute_other_channels => kinematics_compute_other_channels
(Processes: procedures) +≡
    subroutine kinematics_compute_other_channels (k, mci_work, phs_channel)
        class(kinematics_t), intent(inout) :: k
        type(mci_work_t), intent(in) :: mci_work
        integer, intent(in) :: phs_channel
        integer :: c, c_sf
        call k%phs%evaluate_other_channels (phs_channel)
        do c = 1, k%n_channel
            c_sf = k%phs%config%get_sf_channel (c)
            k%f(c) = k%sf_chain%get_f (c_sf) * k%phs%get_f (c)
        end do
    end subroutine kinematics_compute_other_channels
```

Just fetch the outgoing momenta of the `sf_chain` subobject, which become the incoming (seed) momenta of the hard interaction.

This is a stripped down-version of the above which we use when recovering kinematics. Momenta are known, but no MC parameters yet.

(We do not use the `get_out_momenta` method of the chain, since this relies on the structure-function interactions, which are not necessary filled here. We do rely on the momenta of the last evaluator in the chain, however.)

```
(Processes: kinematics: TBP) +≡
    procedure :: get_incoming_momenta => kinematics_get_incoming_momenta
(Processes: procedures) +≡
    subroutine kinematics_get_incoming_momenta (k, p)
        class(kinematics_t), intent(in) :: k
        type(vector4_t), dimension(:), intent(out) :: p
        type(interaction_t), pointer :: int
        integer :: i
        int => k%sf_chain%get_out_int_ptr ()
        do i = 1, k%n_in
            p(i) = int%get_momentum (k%sf_chain%get_out_i (i))
        end do
    end subroutine kinematics_get_incoming_momenta
```

This inverts the remainder of the above `compute` method. We know the momenta and recover the rest, as far as needed. If we select a channel, we can complete the inversion and reconstruct the MC parameter set.

```

subroutine kinematics_return_beam_momenta (k)
class(kinematics_t), intent(in) :: k
call k%sf_chain%return_beam_momenta ()
end subroutine kinematics_return_beam_momenta

```

### Process component instance

The actual calculation of a sampling point is done from here.

The `config` pointer accesses the corresponding configuration in the `process` object.

The `active` flag indicates that we are currently computing this component, together with all other components that share the same MC parameter set. Inactive components are using a different MC parameter set and are not in use for this sampling point.

The `k_seed` subobject contains the kinematics (structure-function chain, phase space, etc.) that implements the ‘seed’ configuration of momenta. This version of the process kinematics is accessed by the MCI setup.

`p_seed` is the array of momenta that we compute from the MC input parameters, via the `k_seed` subobject. Depending on the process variant, these may or may not coincide with the momenta that enter the process terms associated to this component.

The `core_state` object can be used for storing intermediate results. Its precise type and contents depend on the process variant.

```

<Processes: types>+≡
type :: component_instance_t
    type(process_component_t), pointer :: config => null ()
    logical :: active = .false.
    type(kinematics_t) :: k_seed

Compute the momenta in the hard interactions, one for each term that constitutes this process component. In simple cases this amounts to just copying momenta. In more advanced cases, we may generate distinct sets of momenta from the seed kinematics.

The interactions in the term instances are accessed individually. We may choose to calculate all terms at once together with the seed kinematics, use component%core\_state for storage, and just fill the interactions here.

```

```

Here, we invert this. We fetch the incoming momenta which reside in the appropriate `sf_chain` object, stored within the `k_seed` subobject. On the other hand, we have the outgoing momenta of the effective interaction. We rely on the process core to compute the remaining seed momenta and to fill the momenta within the hard interaction. (The latter is trivial if hard and effective interaction coincide.)

After this is done, the incoming momenta in the trace evaluator that corresponds to the hard (effective) interaction, are still left undefined. We remedy this by calling `receive_kinematics` once.

### Term instance

A `term_instance_t` object contains all data that describe a term. Each process component consists of one or more distinct terms which may differ in kinematics, but whose squared transition matrices have to be added pointwise.

The `active` flag is set when this term is connected to an active process component. Inactive terms are skipped for kinematics and evaluation.

The `k_term` object is the instance of the kinematics setup (structure-function chain, phase space, etc.) that applies specifically to this term. In ordinary cases, it consists of straight pointers to the seed kinematics.

The `amp` array stores the amplitude values when we get them from evaluating the associated matrix-element code.

The `int_hard` interaction describes the elementary hard process. It receives the momenta and the amplitude entries for each sampling point.

The `isolated` object holds the effective parton state for the elementary interaction. The amplitude entries are computed from `int_hard`.

The `connected` evaluator set convolutes this scattering matrix with the beam (and possibly structure-function) density matrix.

The `checked` flag is set once we have applied cuts on this term. The result of this is stored in the `passed` flag. Once the term has passed cuts, we calculate the various scale and weight expressions.

```

```

For initialization, we make use of defined assignment for the `interaction_t` type. This creates a deep copy.

The hard interaction (incoming momenta) is linked to the structure function instance. In the isolated state, we either set pointers to both, or we create modified copies (`rearrange`) as effective structure-function chain and interaction, respectively.

Finally, we set up the `subevt` component that will be used for evaluating observables, collecting particles from the trace evaluator in the effective connected state. Their quantum numbers must be determined by following back source links and set explicitly, since they are already eliminated in that trace.

The `rearrange` parts are still commented out; they could become relevant for a NLO algorithm.

```

Complete the kinematics computation for the effective parton states.

We assume that the `compute_hard_kinematics` method of the process component instance has already been called, so the `int_hard` contains the correct hard kinematics. The duty of this procedure is first to compute the effective kinematics and store this in the `int_eff` effective interaction inside the `isolated` parton state. The effective kinematics may differ from the kinematics in the hard interaction. It may involve parton recombination or parton splitting. The `rearrange_partons` method is responsible for this part.

We may also call a method to compute the effective structure-function chain at this point. This is not implemented yet.

In the simple case that no rearrangement is necessary, as indicated by the `rearrange` flag, the effective interaction is a pointer to the hard interaction, and we can skip the rearrangement method. Similarly for the effective structure-function chain. (If we have an algorithm that uses rearrangement, it should evaluate `k_term` explicitly.)

The final step of kinematics setup is to transfer the effective kinematics to the evaluators and to the `subevt`.

```

```

Return data that might be useful for external processing. The factorization scale:

```

⟨Processes: term instance: TBP⟩+≡
procedure :: get_fac_scale => term_instance_get_fac_scale
⟨Processes: procedures⟩+≡
function term_instance_get_fac_scale (term) result (fac_scale)
    class(term_instance_t), intent(in) :: term
    real(default) :: fac_scale
    fac_scale = term%fac_scale
end function term_instance_get_fac_scale

```

We take the strong coupling from the process core. The value is calculated when a new event is requested, so we should call it only after the event has been evaluated. If it is not available there (a negative number is returned), we take the value stored in the term configuration, which should be determined by the model. If the model does not provide a value, the result is zero.

```

⟨Processes: term instance: TBP⟩+≡
procedure :: get_alpha_s => term_instance_get_alpha_s
⟨Processes: procedures⟩+≡

    end associate
    if (alpha_s < 0) alpha_s = term%config%alpha_s
end function term_instance_get_alpha_s

```

## MC parameter set and MCI instance

For each process component that is associated with a multi-channel integration (MCI) object, the `mci_work_t` object contains the currently active parameter set. It also holds the implementation of the `mci_instance_t` that the integrator needs for doing its work.

```
(Processes: types)+≡  
type :: mci_work_t  
    type(process_mci_entry_t), pointer :: config => null ()  
    real(default), dimension(:), allocatable :: x  
    class(mci_instance_t), pointer :: mci => null ()  
    type(process_counter_t) :: counter  
contains  
(Processes: mci work: TBP)  
end type mci_work_t
```

First write configuration data, then the current values.

```
(Processes: mci work: TBP)≡  
procedure :: write => mci_work_write  
(Processes: procedures)+≡  
subroutine mci_work_write (mci_work, unit, testflag)  
    class(mci_work_t), intent(in) :: mci_work  
    integer, intent(in), optional :: unit  
    logical, intent(in), optional :: testflag  
    integer :: u, i  
    u = given_output_unit (unit)  
    write (u, "(1x,A,I0,A)" ) "Active MCI instance #", &  
        mci_work%config%i_mci, " ="  
    write (u, "(2x)", advance="no")  
    do i = 1, mci_work%config%n_par  
        write (u, "(1x,F7.5)", advance="no") mci_work%x(i)  
        if (i == mci_work%config%n_par_sf) &  
            write (u, "(1x,'|')", advance="no")  
    end do  
    write (u, *)  
    if (associated (mci_work%mci)) then  
        call mci_work%mci%write (u, pacify = testflag)  
        call mci_work%counter%write (u)  
    end if  
end subroutine mci_work_write
```

The `mci` component may require finalization.

```
(Processes: mci work: TBP)+≡  
procedure :: final => mci_work_final  
(Processes: procedures)+≡  
subroutine mci_work_final (mci_work)  
    class(mci_work_t), intent(inout) :: mci_work  
    if (associated (mci_work%mci)) then  
        call mci_work%mci%final ()  
        deallocate (mci_work%mci)  
    end if  
end subroutine mci_work_final
```

Initialize with the maximum length that we will need. Contents are not initialized.

The integrator inside the `mci_entry` object is responsible for allocating and initializing its own instance, which is referred to by a pointer in the `mci_work` object.

```
(Processes: mci work: TBP)+≡
    procedure :: init => mci_work_init

(Processes: procedures)+≡
    subroutine mci_work_init (mci_work, mci_entry)
        class(mci_work_t), intent(out) :: mci_work
        type(process_mci_entry_t), intent(in), target :: mci_entry
        mci_work%config => mci_entry
        allocate (mci_work%x (mci_entry%n_par))
        if (allocated (mci_entry%mci)) then
            call mci_entry%mci%allocate_instance (mci_work%mci)
            call mci_work%mci%init (mci_entry%mci)
        end if
    end subroutine mci_work_init
```

Set parameters explicitly, either all at once, or separately for the structure-function and process parts.

```
(Processes: mci work: TBP)+≡
    procedure :: set => mci_work_set
    procedure :: set_x_strfun => mci_work_set_x_strfun
    procedure :: set_x_process => mci_work_set_x_process

(Processes: procedures)+≡
    subroutine mci_work_set (mci_work, x)
        class(mci_work_t), intent(inout) :: mci_work
        real(default), dimension(:), intent(in) :: x
        mci_work%x = x

### The process instance

A process instance contains all process data that depend on the sampling point and thus change often. In essence, it is an event record at the elementary (parton) level. We do not call it such, to avoid confusion with the actual event records. If decays are involved, the latter are compositions of several elementary processes (i.e., their instances).

We implement the process instance as an extension of the `mci_sampler_t` that we need for computing integrals and generate events.

The base type contains: the `integrand`, the `selected_channel`, the two-dimensional array `x` of parameters, and the one-dimensional array `f` of Jacobians. These subobjects are public and used for communicating with the multi-channel integrator.

The `process` pointer accesses the process of which this record is an instance. It is required whenever the calculation needs invariant configuration data, therefore the process should stay in memory for the whole lifetime of its instances.

The `evaluation_status` code is used to check the current status. In particular, failure at various stages is recorded there.

The `count` object records process evaluations, broken down according to status.

The `sqme` value is the single real number that results from evaluating and tracing the kinematics and matrix elements. This is the number that is handed over to an integration routine.

The `weight` value is the event weight. It is defined when an event has been generated from the process instance, either weighted or unweighted. The value is the `sqme` value times Jacobian weights from the integration, or unity, respectively.

The `i_mci` index chooses a subset of components that are associated with a common parameter set and integrator, i.e., that are added coherently.

The `sf_chain` subobject is a realization of the beam and structure-function configuration in the `process` object. It is not used for calculation directly

but serves as the template for the sf-chain instances that are contained in the component objects.

The component subobjects determine the state of each component.

The term subobjects are workspace for evaluating kinematics, matrix elements, cuts etc.

The mci\_work subobject contains the array of real input parameters (random numbers) that generates the kinematical point. It also contains the workspace for the MC integrators. The active entry of the mci\_work array is selected by the i\_mci index above.

```
(Processes: public)+≡
  public :: process_instance_t

(Processes: types)+≡
  type, extends (mci_sampler_t) :: process_instance_t
    type(process_t), pointer :: process => null()
    integer :: evaluation_status = STAT_UNDEFINED
    real(default) :: sqme = 0
    real(default), dimension(:, :), allocatable :: sqme_real
    real(default) :: weight = 0
    real(default) :: excess = 0
    integer :: i_mci = 0
    integer :: selected_channel = 0
    type(sf_chain_t) :: sf_chain
    type(component_instance_t), dimension(:, :), allocatable :: component
    type(term_instance_t), dimension(:, :), allocatable :: term
    type(mci_work_t), dimension(:, :), allocatable :: mci_work
    type(sqme_collector_t), pointer :: sqme_collector => null()
    type(nlo_controller_t), pointer :: nlo_controller => null()
    logical :: collect_matrix_elements = .false.
    integer :: active_real_component = 1
  contains
    (Processes: process instance: TBP)
  end type process_instance_t
```

The output routine contains a header with the most relevant information about the process, copied from process\_metadata\_write. We mark the active components by an asterisk.

The next section is the MC parameter input. The following sections are written only if the evaluation status is beyond setting the parameters, or if the verbose option is set.

Initialization connects the instance with a process. All initial information is transferred from the process object. The process object contains templates for the interaction subobjects (beam and term), but no evaluators. The initialization routine creates evaluators for the matrix element trace, other evaluators are left untouched.

The `instance` object must have the `target` attribute (also in any caller) since the initialization routine assigns various pointers to subobject of `instance`.

        nlo_type = component%config%config%get_nlo_type ()
        term%nlo_type = nlo_type
        call component%k_seed%set_nlo_info (nlo_type)

        call term%init (process%term(i), &

```

```

        component%k_seed, &
        process%beam_config, &
        process%component(i_component)%core, &
        process%meta%var_list, component%nlo_controller)
    call term%setup_expressions (process%meta, process%config)
    select case (nlo_type)
    case (NLO_REAL)
        call term%setup_expressions_real (process%meta, process%config)
    end select
    end associate
    end if
    end associate
end do
if (present (combined_integration)) then
    if (combined_integration) then
        instance%collect_matrix_elements = .true.
        instance%sqme_collector => instance%nlo_controller%sqme_collector
    end if
end if
instance%evaluation_status = STAT_INITIAL
end subroutine process_instance_init

```

Subroutine of the initialization above: initialize the beam and structure-function chain template. We establish pointers to the configuration data, so `beam_config` must have a `target` attribute.

The resulting chain is not used directly for calculation. It will acquire instances which are stored in the process-component instance objects.

```

⟨Processes: process instance: TBP⟩+≡
procedure :: setup_sf_chain => process_instance_setup_sf_chain
⟨Processes: procedures⟩+≡
subroutine process_instance_setup_sf_chain (instance, config)
    class(process_instance_t), intent(inout) :: instance
    type(process_beam_config_t), intent(in), target :: config
    integer :: n_strfun
    n_strfun = config%n_strfun
    if (n_strfun /= 0) then
        call instance%sf_chain%init (config%data, config%sf)
    else
        call instance%sf_chain%init (config%data)
    end if
    if (config%sf_trace) then
        call instance%sf_chain%setup_tracing (config%sf_trace_file)
    end if
end subroutine process_instance_setup_sf_chain

```

This initialization routine should be called only for process instances which we intend as a source for physical events. It initializes the evaluators in the parton states of the terms. They describe the (semi-)exclusive transition matrix and the distribution of color flow for the partonic process, convoluted with the beam and structure-function chain.

If the model is not provided explicitly, we may use the model instance that belongs to the process. However, an explicit model allows us to override particle

settings.

```
<Processes: process instance: TBP>+≡
    procedure :: setup_event_data => process_instance_setup_event_data
<Processes: procedures>+≡
    subroutine process_instance_setup_event_data (instance, model)
        class(process_instance_t), intent(inout), target :: instance
        class(model_data_t), intent(in), optional, target :: model
        class(model_data_t), pointer :: current_model
        integer :: i, i_component
        if (present (model)) then
            current_model => model
        else
            current_model => instance%process%config%model
        end if
        do i = 1, size (instance%term)
            associate (term => instance%term(i))
                if (associated (term%config)) then
                    i_component = term%config%i_component
                    associate (component => instance%process%component(i_component))
                        call term%setup_event_data (component%core, current_model)
                    end associate
                end if
            end associate
        end do
    end subroutine process_instance_setup_event_data
```

Choose a MC parameter set and the corresponding integrator. The choice persists beyond calls of the `reset` method above. This method is automatically called here.

```
<Processes: process instance: TBP>+≡
    procedure :: choose_mci => process_instance_choose_mci
<Processes: procedures>+≡
    subroutine process_instance_choose_mci (instance, i_mci)
        class(process_instance_t), intent(inout) :: instance
        integer, intent(in) :: i_mci
        instance%i_mci = i_mci
        call instance%reset ()
    end subroutine process_instance_choose_mci
```

Explicitly set a MC parameter set. Works only if we are in initial state. We assume that the length of the parameter set is correct.

After setting the parameters, activate the components and terms that correspond to the chosen MC parameter set.

```
<Processes: process instance: TBP>+≡
    procedure :: set_mcpar => process_instance_set_mcpar
<Processes: procedures>+≡
    subroutine process_instance_set_mcpar (instance, x)
        class(process_instance_t), intent(inout) :: instance
        real(default), dimension(:), intent(in) :: x
        if (instance%evaluation_status == STAT_INITIAL) then
            associate (mci_work => instance%mci_work(instance%i_mci))
```

```

        call mci_work%set (x)
    end associate
    call instance%activate ()
end if
end subroutine process_instance_set_mcpar

```

Receive the beam momentum/momenta from a source interaction. This applies to a cascade decay process instance, where the ‘beam’ momentum varies event by event.

The master beam momentum array is contained in the main structure function chain subobject **sf\_chain**. The sf-chain instance that reside in the components will take their beam momenta from there.

The procedure transforms the instance status into **STAT\_BEAM\_MOMENTA**. For process instance with fixed beam, this intermediate status is skipped.

```

⟨Processes: process instance: TBP⟩+≡
procedure :: receive_beam_momenta => process_instance_receive_beam_momenta
⟨Processes: procedures⟩+≡
subroutine process_instance_receive_beam_momenta (instance)
    class(process_instance_t), intent(inout) :: instance
    if (instance%evaluation_status >= STAT_INITIAL) then
        call instance%sf_chain%receive_beam_momenta ()
        instance%evaluation_status = STAT_BEAM_MOMENTA
    end if
end subroutine process_instance_receive_beam_momenta

```

Set the beam momentum/momenta explicitly. Otherwise, analogous to the previous procedure.

```

⟨Processes: process instance: TBP⟩+≡
procedure :: set_beam_momenta => process_instance_set_beam_momenta
⟨Processes: procedures⟩+≡
subroutine process_instance_set_beam_momenta (instance, p)
    class(process_instance_t), intent(inout) :: instance
    type(vector4_t), dimension(:), intent(in) :: p
    if (instance%evaluation_status >= STAT_INITIAL) then
        call instance%sf_chain%set_beam_momenta (p)
        instance%evaluation_status = STAT_BEAM_MOMENTA
    end if
end subroutine process_instance_set_beam_momenta

```

Recover the initial beam momenta (those in the **sf\_chain** component), given a valid (recovered) **sf\_chain\_instance** in one of the active components. We need to do this only if the lab frame is not the c.m. frame, otherwise those beams would be fixed anyway.

```

⟨Processes: process instance: TBP⟩+≡
procedure :: recover_beam_momenta => process_instance_recover_beam_momenta
⟨Processes: procedures⟩+≡
subroutine process_instance_recover_beam_momenta (instance, i_term)
    class(process_instance_t), intent(inout) :: instance
    integer, intent(in) :: i_term
    integer :: i

```

```

if (.not. instance%process%beam_config%lab_is_cm_frame) then
    if (instance%evaluation_status >= STAT_EFF_KINEMATICS) then
        i = instance%term(i_term)%config%i_component
        call instance%component(i)%return_beam_momenta ()
    end if
end if
end subroutine process_instance_recover_beam_momenta

```

Explicitly choose MC integration channel. We assume here that the channel count is identical for all active components.

```

⟨Processes: process instance: TBP⟩+≡
procedure :: select_channel => process_instance_select_channel

⟨Processes: procedures⟩+≡
subroutine process_instance_select_channel (instance, channel)
    class(process_instance_t), intent(inout) :: instance
    integer, intent(in) :: channel
    instance%selected_channel = channel
end subroutine process_instance_select_channel

```

First step of process evaluation: set up seed kinematics. That is, for each active process component, compute a momentum array from the MC input parameters.

If `skip_term` is set, we skip the component that accesses this term. We can assume that the associated data have already been recovered, and we are just computing the rest.

```

⟨Processes: process instance: TBP⟩+≡
procedure :: compute_seed_kinematics => &
            process_instance_compute_seed_kinematics

⟨Processes: procedures⟩+≡
subroutine process_instance_compute_seed_kinematics (instance, skip_term)
    class(process_instance_t), intent(inout) :: instance
    integer, intent(in), optional :: skip_term
    integer :: channel, skip_component, i
    logical :: success
    channel = instance%selected_channel
    if (channel == 0) then
        call msg_bug ("Compute seed kinematics: undefined integration channel")
    end if
    if (present (skip_term)) then
        skip_component = instance%term(skip_term)%config%i_component
    else
        skip_component = 0
    end if
    if (instance%evaluation_status >= STAT_ACTIVATED) then
        success = .true.
        do i = 1, size (instance%component)
            if (i == skip_component) cycle
            if (instance%component(i)%active) then
                call instance%component(i)%compute_seed_kinematics &
                    (instance%mci_work(instance%i_mci), channel, success)
                if (.not. success) exit
            end if
        end do
    end if

```

```

    end do
    if (success) then
        instance%evaluation_status = STAT_SEED_KINEMATICS
    else
        instance%evaluation_status = STAT_FAILED_KINEMATICS
    end if
end if
associate (mci_work => instance%mci_work(instance%i_mci))
    if (mci_work%config%combined_integration) &
        call instance%nlo_controller%set_x_rad (mci_work%get_x_process ())
end associate
end subroutine process_instance_compute_seed_kinematics

```

Inverse: recover missing parts of the kinematics from the momentum configuration, which we know for a single term and component. Given a channel, reconstruct the MC parameter set.

```

⟨Processes: process instance: TBP⟩+≡
procedure :: recover_mcpar => process_instance_recover_mcpar
⟨Processes: procedures⟩+≡
subroutine process_instance_recover_mcpar (instance, i_term)
    class(process_instance_t), intent(inout) :: instance
    integer, intent(in) :: i_term
    integer :: channel
    integer :: i
    if (instance%evaluation_status >= STAT_EFF_KINEMATICS) then
        channel = instance%selected_channel
        if (channel == 0) then
            call msg_bug ("Recover MC parameters: undefined integration channel")
        end if
        i = instance%term(i_term)%config%i_component
        call instance%component(i)%recover_mcpar &
            (instance%mci_work(instance%i_mci), channel)
    end if
end subroutine process_instance_recover_mcpar

```

Second step of process evaluation: compute all momenta, for all active components, from the seed kinematics.

```

⟨Processes: process instance: TBP⟩+≡
procedure :: compute_hard_kinematics => &
    process_instance_compute_hard_kinematics
⟨Processes: procedures⟩+≡
subroutine process_instance_compute_hard_kinematics (instance, skip_term)
    class(process_instance_t), intent(inout) :: instance
    integer, intent(in), optional :: skip_term
    integer :: i
    logical :: real_phsp
    if (instance%evaluation_status >= STAT_SEED_KINEMATICS) then
        do i = 1, size (instance%component)
            if (instance%component(i)%active) then
                select case (instance%component(i)%config%config%get_nlo_type())
                    case (BORN, NLO_VIRTUAL, NLO_PDF)
                        real_phsp = .false.

```

```

        case (NLO_REAL)
            real_phsp = .true.
        end select
        call instance%component(i)% &
            compute_hard_kinematics (instance%term, skip_term, real_phsp)
    end if
end do
instance%evaluation_status = STAT_HARD_KINEMATICS
end if
end subroutine process_instance_compute_hard_kinematics

```

Inverse: recover seed kinematics. We know the beam momentum configuration and the outgoing momenta of the effective interaction, for one specific term.

```

⟨Processes: process instance: TBP⟩+≡
procedure :: recover_seed_kinematics => &
    process_instance_recover_seed_kinematics

⟨Processes: procedures⟩+≡
subroutine process_instance_recover_seed_kinematics (instance, i_term)
    class(process_instance_t), intent(inout) :: instance
    integer, intent(in) :: i_term
    if (instance%evaluation_status >= STAT_EFF_KINEMATICS) then
        associate (i_component => instance%term(i_term)%config%i_component)
            call instance%component(i_component)% &
                recover_seed_kinematics (instance%term(i_term))
        end associate
    end if
end subroutine process_instance_recover_seed_kinematics

```

Third step of process evaluation: compute the effective momentum configurations, for all active terms, from the hard kinematics.

```

⟨Processes: process instance: TBP⟩+≡
procedure :: compute_eff_kinematics => &
    process_instance_compute_eff_kinematics

⟨Processes: procedures⟩+≡
subroutine process_instance_compute_eff_kinematics (instance, skip_term)
    class(process_instance_t), intent(inout) :: instance
    integer, intent(in), optional :: skip_term
    integer :: i
    if (instance%evaluation_status >= STAT_HARD_KINEMATICS) then
        do i = 1, size (instance%term)
            if (present (skip_term)) then
                if (i == skip_term) cycle
            end if
            if (instance%term(i)%active) then
                call instance%term(i)% &
                    compute_eff_kinematics (instance%component)
            end if
        end do
        instance%evaluation_status = STAT_EFF_KINEMATICS
    end if
end subroutine process_instance_compute_eff_kinematics

```

Inverse: recover the hard kinematics from effective kinematics for one term, then compute effective kinematics for the other terms.

```

⟨Processes: process instance: TBP⟩+≡
procedure :: recover_hard_kinematics => &
    process_instance_recover_hard_kinematics

⟨Processes: procedures⟩+≡
subroutine process_instance_recover_hard_kinematics (instance, i_term)
    class(process_instance_t), intent(inout) :: instance
    integer, intent(in) :: i_term
    integer :: i
    if (instance%evaluation_status >= STAT_EFF_KINEMATICS) then
        call instance%term(i_term)%recover_hard_kinematics (instance%component)
        do i = 1, size (instance%term)
            if (i /= i_term) then
                if (instance%term(i)%active) then
                    call instance%term(i)% &
                        compute_eff_kinematics (instance%component)
                end if
            end if
        end do
        instance%evaluation_status = STAT_EFF_KINEMATICS
    end if
end subroutine process_instance_recover_hard_kinematics

```

Fourth step of process evaluation: check cuts for all terms. Where sucessful, compute any scales and weights. Otherwise, deactivate the term. If any of the terms has passed, set the state to STAT\_PASSED\_CUTS.

The argument `scale_forced`, if present, will override the scale calculation in the term expressions.

```

⟨Processes: process instance: TBP⟩+≡
procedure :: evaluate_expressions => &
    process_instance_evaluate_expressions

⟨Processes: procedures⟩+≡
subroutine process_instance_evaluate_expressions (instance, scale_forced)
    class(process_instance_t), intent(inout) :: instance
    real(default), intent(in), allocatable, optional :: scale_forced
    integer :: i
    if (instance%evaluation_status >= STAT_EFF_KINEMATICS) then
        do i = 1, size (instance%term)
            if (instance%term(i)%active) then
                call instance%term(i)%evaluate_expressions (scale_forced)
            end if
        end do
        if (any (instance%term%passed)) then
            instance%evaluation_status = STAT_PASSED_CUTS
        else
            instance%evaluation_status = STAT_FAILED_CUTS
        end if
    end if
end subroutine process_instance_evaluate_expressions

```

Fifth step of process evaluation: fill the parameters for the non-selected channels, that have not been used for seeding. We should do this after evaluating cuts, since we may save some expensive calculations if the phase space point fails the cuts.

If `skip_term` is set, we skip the component that accesses this term. We can assume that the associated data have already been recovered, and we are just computing the rest.

```
(Processes: process instance: TBP) +≡
procedure :: compute_other_channels => &
            process_instance_compute_other_channels
(Processes: procedures) +≡
subroutine process_instance_compute_other_channels (instance, skip_term)
  class(process_instance_t), intent(inout) :: instance
  integer, intent(in), optional :: skip_term
  integer :: channel, skip_component, i
  channel = instance%selected_channel
  if (channel == 0) then
    call msg_bug ("Compute other channels: undefined integration channel")
  end if
  if (present (skip_term)) then
    skip_component = instance%term(skip_term)%config%i_component
  else
    skip_component = 0
  end if
  if (instance%evaluation_status >= STAT_PASSED_CUTS) then
    do i = 1, size (instance%component)
      if (i == skip_component) cycle
      if (instance%component(i)%active) then
        call instance%component(i)%compute_other_channels &
              (instance%mci_work(instance%i_mci), channel)
      end if
    end do
  end if
end subroutine process_instance_compute_other_channels
```

Sixth step of process evaluation: evaluate the matrix elements, and compute the trace (summed over quantum numbers) for all terms. Finally, sum up the terms, iterating over all active process components.

```
(Processes: process instance: TBP) +≡
procedure :: evaluate_trace => process_instance_evaluate_trace
(Processes: procedures) +≡
subroutine process_instance_evaluate_trace (instance)
  class(process_instance_t), intent(inout) :: instance
  integer :: i, i_real
  instance%sqme = 0
  i_real = 0
  if (instance%evaluation_status >= STAT_PASSED_CUTS) then
    do i = 1, size (instance%term)
      associate (term => instance%term(i))
      if (term%active .and. term%passed) then
        select case (term%nlo_type)
          case (NLO_REAL)
```

```

        if (.not. instance%collect_matrix_elements) then
            if (debug_active (D_SUBTRACTION)) &
                call msg_debug (D_SUBTRACTION, "Evaluate real trace")
                call instance%evaluate_trace_real (term, i)
            else
                i_real = i
            end if
        case (BORN, NLO_VIRTUAL, NLO_PDF)
            call term%evaluate_interaction (instance%component)
            call term%evaluate_trace ()
        end select
    end if
end associate
end do
do i = 1, size (instance%component)
    associate (component => instance%component(i))
        if (component%active) then
            select case (component%config%config%get_nlo_type())
            case (BORN, NLO_VIRTUAL, NLO_PDF)
                call component%evaluate_sqme (instance%term)
                instance%sqme = instance%sqme + component%sqme
                instance%evaluation_status = STAT_EVALUATED_TRACE
            end select
        end if
    end associate
end do
if (instance%collect_matrix_elements .and. i_real > 0) &
    call instance%evaluate_trace_real (instance%term(i_real), i_real)
else
    ! failed kinematics, failed cuts: set sqme to zero
    instance%sqme = 0
end if
end subroutine process_instance_evaluate_trace

```

Final step of process evaluation: evaluate the matrix elements, and compute the trace (summed over quantum numbers) for all terms. Finally, sum up the terms, iterating over all active process components.

If `weight` is provided, we already know the kinematical event weight (the MCI weight which depends on the kinematics sampling algorithm, but not on the matrix element), so we do not need to take it from the MCI record.

```

<Processes: process instance: TBP>+≡
procedure :: evaluate_event_data => process_instance_evaluate_event_data
<Processes: procedures>+≡
subroutine process_instance_evaluate_event_data (instance, weight)
    class(process_instance_t), intent(inout) :: instance
    real(default), intent(in), optional :: weight
    integer :: i
    if (instance%evaluation_status >= STAT_EVALUATED_TRACE) then
        do i = 1, size (instance%term)
            associate (term => instance%term(i))
                if (term%active .and. term%passed) then
                    call term%evaluate_event_data ()
                end if
        end do
    end if

```

```

        end associate
    end do
    if (present (weight)) then
        instance%weight = weight
    else
        instance%weight = &
            instance%mc_i_work(instance%i_mci)%mc_i%get_event_weight ()
        instance%excess = &
            instance%mc_i_work(instance%i_mci)%mc_i%get_event_excess ()
    end if
    instance%evaluation_status = STAT_EVENT_COMPLETE
else
    ! failed kinematics etc.: set weight to zero
    instance%weight = 0
end if
end subroutine process_instance_evaluate_event_data

```

For the real part of the process evaluation at NLO, trace evaluation is a bit more intricate because the phase-spaces for different emitters might be treated differently by cuts. A phase-space point is discarded if it fails the cuts for at least one emitter.

```

<Processes: process instance: TBP>+≡
    procedure :: evaluate_trace_real => process_instance_evaluate_trace_real
<Processes: procedures>+≡
    subroutine process_instance_evaluate_trace_real (instance, term, i)
        class(process_instance_t), intent(inout) :: instance
        type(term_instance_t), intent(inout) :: term
        integer, intent(in) :: i
        integer :: j, ireg, i_flv_real, i_flv_born
        integer :: nlegs
        integer :: fixed_emitter
        real(default) :: sqme_born
        call msg_debug (D_SUBTRACTION, "process_instance_evaluate_trace_real")

        nlegs = term%nlo_controller%reg_data%nlegs_real
        ireg = 1
        instance%sqme_real = 0

        fixed_emitter = instance%get_fixed_emitter (i)

        if (debug_active (D_SUBTRACTION)) then

```

This is a convenience routine that performs the computations of the steps 1 to 5 in a single step. The arguments are the input for `set_mpar`. After this, the evaluation status should be either `STAT_FAILED_KINEMATICS`, `STAT_FAILED_CUTS` or `STAT_EVALUATED_TRACE`.

Before calling this, we should call `choose_mci`.

```

⟨Processes: process instance: TBP⟩+≡
procedure :: evaluate_sqme => process_instance_evaluate_sqme
⟨Processes: procedures⟩+≡
subroutine process_instance_evaluate_sqme (instance, channel, x)
  class(process_instance_t), intent(inout) :: instance

  call instance%evaluate_expressions ()
  call instance%compute_other_channels ()
  call instance%evaluate_trace ()
  if (instance%collect_matrix_elements) &
    instance%sqme = instance%sqme_collector%get_sqme_sum ()
end subroutine process_instance_evaluate_sqme
```

This is the inverse. Assuming that the final trace evaluator contains a valid momentum configuration, recover kinematics and recalculate the matrix elements and their trace.

To be precise, we first recover kinematics for the given term and associated component, then recalculate from that all other terms and active components. The `channel` is not really required to obtain the matrix element, but it allows us to reconstruct the exact MC parameter set that corresponds to the given phase space point.

Before calling this, we should call `choose_mci`.

```

⟨Processes: process instance: TBP⟩+≡
procedure :: recover => process_instance_recover
⟨Processes: procedures⟩+≡
subroutine process_instance_recover &
  (instance, channel, i_term, update_sqme, scale_forced)

if (update_sqme) call instance%evaluate_trace ()
end subroutine process_instance_recover

```

The `evaluate` method is required by the `sampler_t` base type of which the process instance is an extension.

The requirement is that after the process instance is evaluated, the integrand, the selected channel, the  $x$  array, and the  $f$  Jacobian array are exposed by the `sampler_t` object.

```

⟨Processes: process instance: TBP⟩+≡
procedure :: evaluate => process_instance_evaluate
⟨Processes: procedures⟩+≡
subroutine process_instance_evaluate (sampler, c, x_in, val, x, f)
  class(process_instance_t), intent(inout) :: sampler
  integer, intent(in) :: c
  real(default), dimension(:), intent(in) :: x_in
  real(default), intent(out) :: val
  real(default), dimension(:, :, :), intent(out) :: x
  real(default), dimension(:, :, :), intent(out) :: f
  call sampler%evaluate_sqme (c, x_in)
  if (sampler%is_valid ()) call sampler%fetch (val, x, f)
  call sampler%record_call ()
end subroutine process_instance_evaluate

```

The phase-space point is valid if the event has valid kinematics and has passed the cuts.

```

⟨Processes: process instance: TBP⟩+≡
procedure :: is_valid => process_instance_is_valid
⟨Processes: procedures⟩+≡
function process_instance_is_valid (sampler) result (valid)
  class(process_instance_t), intent(in) :: sampler
  logical :: valid
  valid = sampler%evaluation_status >= STAT_PASSED_CUTS
end function process_instance_is_valid

```

The `rebuild` method should rebuild the kinematics section out of the `x_in` parameter set. The integrand value `val` should not be computed, but is provided as input.

```

⟨Processes: process instance: TBP⟩+≡
procedure :: rebuild => process_instance_rebuild
⟨Processes: procedures⟩+≡
subroutine process_instance_rebuild (sampler, c, x_in, val, x, f)
  class(process_instance_t), intent(inout) :: sampler

end subroutine process_instance_final_simulation

```

### 28.3.12 Accessing the process instance

Once the seed kinematics is complete, we can retrieve the MC input parameters for all channels, not just the seed channel.

Note: We choose the first active component. This makes sense only if the seed kinematics is identical for all active components.

```

⟨Processes: process instance: TBP⟩+≡
    procedure :: get_mcpar => process_instance_get_mcpar
⟨Processes: procedures⟩+≡
    subroutine process_instance_get_mcpar (instance, channel, x)
        class(process_instance_t), intent(inout) :: instance
        integer, intent(in) :: channel
        real(default), dimension(:), intent(out) :: x
        integer :: i
        if (instance%evaluation_status >= STAT_SEED_KINEMATICS) then
            do i = 1, size (instance%component)
                if (instance%component(i)%active) then
                    call instance%component(i)%k_seed%get_mcpar (channel, x)
                    return
                end if
            end do
            call msg_bug ("Process instance: get_mcpar: no active channels")
        else
            call msg_bug ("Process instance: get_mcpar: no seed kinematics")
        end if
    end subroutine process_instance_get_mcpar

```

Return true if the `sqme` value is known. This also implies that the event is kinematically valid and has passed all cuts.

```

⟨Processes: process instance: TBP⟩+≡
    procedure :: has_evaluated_trace => process_instance_has_evaluated_trace
⟨Processes: procedures⟩+≡
    function process_instance_has_evaluated_trace (instance) result (flag)

### 28.3.13 Particle sets

Here we provide two procedures that convert the process instance from/to a particle set. The conversion applies to the trace evaluator which has no quantum-number information, thus it involves only the momenta and the parent-child relations. We keep virtual particles.

Nevertheless, it is possible to reconstruct the complete structure from a particle set. The reconstruction implies a re-evaluation of the structure function and matrix-element codes.

The `i_term` index is needed for both input and output, to select among different active trace evaluators.

In both cases, the `instance` object must be properly initialized.

NB: The `recover_beams` option should be used only when the particle set originates from an external event file, and the user has asked for it. It should be switched off when reading from raw event file.

```

⟨Processes: process instance: TBP⟩+≡
    procedure :: get_trace => process_instance_get_trace
    procedure :: set_trace => process_instance_set_trace

⟨Processes: procedures⟩+≡
    subroutine process_instance_get_trace (instance, pset, i_term)
        class(process_instance_t), intent(in), target :: instance
        type(particle_set_t), intent(out) :: pset
        integer, intent(in) :: i_term
        type(interaction_t), pointer :: int
        logical :: ok
        int => instance%get_trace_int_ptr (i_term)
        call pset%init (ok, int, int, FM_IGNORE_HELCITY, &

```

```

    [0._default, 0._default], .false., .true.)
end subroutine process_instance_get_trace

    ⟨Processes: execute tests⟩
    end subroutine processes_test

```

### Test process type

For the following tests, we define a simple implementation of the abstract `prc_core_t`, designed such as to complement the `prc_test_t` process definition type.

Note that it is not given that the actual process is defined as `prc_test_t`

type. We enforce this by calling `prc_test_create_library`. The driver component in the process core will then become of type `prc_test_t`.

```
(Processes: public)+≡
    public :: test_t

(Processes: test types)≡
    type, extends (prc_core_t) :: test_t
    contains
        procedure :: write => test_write
        procedure :: needs_mcset => test_needs_mcset
        procedure :: get_n_terms => test_get_n_terms
        procedure :: is_allowed => test_is_allowed
        procedure :: compute_hard_kinematics => test_compute_hard_kinematics
        procedure :: compute_eff_kinematics => test_compute_eff_kinematics
        procedure :: recover_kinematics => test_recover_kinematics
        procedure :: compute_amplitude => test_compute_amplitude
    end type test_t

(Processes: test type procedures)≡
    subroutine test_write (object, unit)
        class(test_t), intent(in) :: object
        integer, intent(in), optional :: unit
        integer :: u
        u = given_output_unit (unit)
        write (u, "(3x,A)") "test type implementing prc_test"
    end subroutine test_write
```

This process type always needs a MC parameter set and a single term. This only state is always allowed.

```
(Processes: test type procedures)+≡
    function test_needs_mcset (object) result (flag)
        class(test_t), intent(in) :: object
        logical :: flag
        flag = .true.
    end function test_needs_mcset

    function test_get_n_terms (object) result (n)
        class(test_t), intent(in) :: object
        integer :: n
        n = 1
    end function test_get_n_terms

    function test_is_allowed (object, i_term, f, h, c) result (flag)
        class(test_t), intent(in) :: object
        integer, intent(in) :: i_term, f, h, c
        logical :: flag
        flag = .true.
    end function test_is_allowed
```

Transfer the generated momenta directly to the hard interaction in the (only) term. We assume that everything has been set up correctly, so the array fits.

```
(Processes: test type procedures)+≡
```

```

subroutine test_compute_hard_kinematics &
    (object, p_seed, i_term, int_hard, core_state)
    class(test_t), intent(in) :: object
    type(vector4_t), dimension(:), intent(in) :: p_seed
    integer, intent(in) :: i_term
    type(interaction_t), intent(inout) :: int_hard
    class(prc_core_state_t), intent(inout), allocatable :: core_state
    call int_hard%set_momenta (p_seed)
end subroutine test_compute_hard_kinematics

```

This procedure is not called for `test_t`, just a placeholder.

*(Processes: test type procedures)*+≡

```

subroutine test_compute_eff_kinematics &
    (object, i_term, int_hard, int_eff, core_state)
    class(test_t), intent(in) :: object
    integer, intent(in) :: i_term
    type(interaction_t), intent(in) :: int_hard
    type(interaction_t), intent(inout) :: int_eff
    class(prc_core_state_t), intent(inout), allocatable :: core_state
end subroutine test_compute_eff_kinematics

```

Transfer the incoming momenta of `p_seed` directly to the effective interaction, and vice versa for the outgoing momenta.

`int_hard` is left untouched since `int_eff` is an alias (via pointer) to it.

*(Processes: test type procedures)*+≡

```

subroutine test_recover_kinematics &
    (object, p_seed, int_hard, int_eff, core_state)
    class(test_t), intent(in) :: object
    type(vector4_t), dimension(:), intent(inout) :: p_seed
    type(interaction_t), intent(inout) :: int_hard
    type(interaction_t), intent(inout) :: int_eff
    class(prc_core_state_t), intent(inout), allocatable :: core_state
    integer :: n_in
    n_in = int_eff%get_n_in ()
    call int_eff%set_momenta (p_seed(1:n_in), outgoing = .false.)
    p_seed(n_in+1:) = int_eff%get_momenta (outgoing = .true.)
end subroutine test_recover_kinematics

```

Compute the amplitude. The driver ignores all quantum numbers and, in fact, returns a constant. Nevertheless, we properly transfer the momentum vectors.

*(Processes: test type procedures)*+≡

```

function test_compute_amplitude &
    (object, j, p, f, h, c, fac_scale, ren_scale, alpha_qcd_forced, core_state) &
    result (amp)
    class(test_t), intent(in) :: object
    integer, intent(in) :: j
    type(vector4_t), dimension(:), intent(in) :: p
    integer, intent(in) :: f, h, c
    real(default), intent(in) :: fac_scale, ren_scale
    real(default), intent(in), allocatable :: alpha_qcd_forced
    class(prc_core_state_t), intent(inout), allocatable, optional :: core_state
    complex(default) :: amp

```

```

## Evaluating a process with structure function

Configure structure functions (single-channel) in a process object, create an instance, compute kinematics and evaluate.

Note the order of operations when setting up structure functions and phase space. The beams are first, they determine the `sqrts` value. We can also set up the chain of structure functions. We then configure the phase space. From this, we can obtain information about special configurations (resonances, etc.), which we need for allocating the possible structure-function channels (parameterizations and mappings). Finally, we match phase-space channels onto structure-function channels.

In the current example, this matching is trivial; we only have one structure-function channel.

```
(Processes: execute tests)+≡
call test (processes_8, "processes_8", &

## 28.4 Process Stacks

For storing and handling multiple processes, we define process stacks. These are ordinary stacks where new process entries are pushed onto the top. We allow for multiple entries with identical process ID, but distinct run ID.

The implementation is essentially identical to the `prclib_stacks` module above. Unfortunately, Fortran supports no generic programming, so we do not make use of this fact.

When searching for a specific process ID, we will get (a pointer to) the top-most process entry with that ID on the stack, which was entered last. Usually, this is the best version of the process (in terms of integral, etc.) Thus the stack terminology makes sense.

```

<process_stacks.f90>≡
  <File header>

  module process_stacks

  <Use strings>
    use io_units
    use format_utils, only: write_separator
    use diagnostics
    use os_interface
    use sm_qcd
    use model_data
    use rng_base
    use variables
    use observables
    use process_libraries
    use processes

  <Standard module head>

  <Process stacks: public>

  <Process stacks: types>

```

```

contains

⟨Process stacks: procedures⟩

end module process_stacks

```

### 28.4.1 The process entry type

A process entry is a process object, augmented by a pointer to the next entry. We do not need specific methods, all relevant methods are inherited.

On higher level, processes should be prepared as process entry objects.

```

⟨Process stacks: public⟩≡
public :: process_entry_t

⟨Process stacks: types⟩≡
type, extends (process_t) :: process_entry_t
type(process_entry_t), pointer :: next => null ()
end type process_entry_t

```

### 28.4.2 The process stack type

For easy conversion and lookup it is useful to store the filling number in the object. The content is stored as a linked list.

The var\_list component stores process-specific results, so they can be retrieved as (pseudo) variables.

The process stack can be linked to another one. This allows us to work with stacks of local scope.

```

⟨Process stacks: public⟩+≡
public :: process_stack_t

⟨Process stacks: types⟩+≡
type :: process_stack_t
integer :: n = 0
type(process_entry_t), pointer :: first => null ()
type(var_list_t), pointer :: var_list => null ()
type(process_stack_t), pointer :: next => null ()
contains
⟨Process stacks: process stack: TBP⟩
end type process_stack_t

```

Finalize partly: deallocate the process stack and variable list entries, but keep the variable list as an empty object. This way, the variable list links are kept.

```

⟨Process stacks: process stack: TBP⟩≡
procedure :: clear => process_stack_clear

⟨Process stacks: procedures⟩≡
subroutine process_stack_clear (stack)
class(process_stack_t), intent(inout) :: stack
type(process_entry_t), pointer :: process
if (associated (stack%var_list)) then
call stack%var_list%final ()

```

```

    end if
    do while (associated (stack%first))
        process => stack%first
        stack%first => process%next
        call process%final ()
        deallocate (process)
    end do
    stack%n = 0
end subroutine process_stack_clear

```

Finalizer. Clear and deallocate the variable list.

```

<Process stacks: process stack: TBP>+≡
    procedure :: final => process_stack_final
<Process stacks: procedures>+≡
    subroutine process_stack_final (object)
        class(process_stack_t), intent(inout) :: object
        call object%clear ()
        if (associated (object%var_list)) then
            deallocate (object%var_list)
        end if
    end subroutine process_stack_final

```

Output. The processes on the stack will be ordered LIFO, i.e., backwards.

```

<Process stacks: process stack: TBP>+≡
    procedure :: write => process_stack_write
<Process stacks: procedures>+≡
    recursive subroutine process_stack_write (object, unit, pacify)
        class(process_stack_t), intent(in) :: object
        integer, intent(in), optional :: unit
        logical, intent(in), optional :: pacify
        type(process_entry_t), pointer :: process
        integer :: u
        u = given_output_unit (unit)
        call write_separator (u, 2)
        select case (object%n)
        case (0)
            write (u, "(1x,A)") "Process stack: [empty]"
            call write_separator (u, 2)
        case default
            write (u, "(1x,A)") "Process stack:"
            process => object%first
            do while (associated (process))
                call process%write (.false., u, pacify = pacify)
                process => process%next
            end do
        end select
        if (associated (object%next)) then
            write (u, "(1x,A)") "[Processes from context environment:]"
            call object%next%write (u, pacify)
        end if
    end subroutine process_stack_write

```

The variable list is printed by a separate routine, since it should be linked to the global variable list, anyway.

```
(Process stacks: process stack: TBP)+≡
    procedure :: write_var_list => process_stack_write_var_list
(Process stacks: procedures)+≡
    subroutine process_stack_write_var_list (object, unit)
        class(process_stack_t), intent(in) :: object
        integer, intent(in), optional :: unit
        if (associated (object%var_list)) then
            call var_list_write (object%var_list, unit)
        end if
    end subroutine process_stack_write_var_list
```

Short output.

```
(Process stacks: process stack: TBP)+≡
    procedure :: show => process_stack_show
(Process stacks: procedures)+≡
    recursive subroutine process_stack_show (object, unit)
        class(process_stack_t), intent(in) :: object
        integer, intent(in), optional :: unit
        type(process_entry_t), pointer :: process
        integer :: u
        u = given_output_unit (unit)
        select case (object%n)
        case (0)
        case default
            process => object%first
            do while (associated (process))
                call process%show (u, verbose=.false.)
                process => process%next
            end do
        end select
        if (associated (object%next)) call object%next%show ()
    end subroutine process_stack_show
```

### 28.4.3 Link

Link the current process stack to a global one.

```
(Process stacks: process stack: TBP)+≡
    procedure :: link => process_stack_link
(Process stacks: procedures)+≡
    subroutine process_stack_link (local_stack, global_stack)
        class(process_stack_t), intent(inout) :: local_stack
        type(process_stack_t), intent(in), target :: global_stack
        local_stack%next => global_stack
    end subroutine process_stack_link
```

Initialize the process variable list and link the main variable list to it.

```
(Process stacks: process stack: TBP)+≡
    procedure :: init_var_list => process_stack_init_var_list
```

```

⟨Process stacks: procedures⟩+≡
    subroutine process_stack_init_var_list (stack, var_list)
        class(process_stack_t), intent(inout) :: stack
        type(var_list_t), intent(inout), optional :: var_list
        allocate (stack%var_list)
        if (present (var_list))  call var_list%link (stack%var_list)
    end subroutine process_stack_init_var_list

```

Link the process variable list to a global variable list.

```

⟨Process stacks: process stack: TBP⟩+≡
    procedure :: link_var_list => process_stack_link_var_list
⟨Process stacks: procedures⟩+≡
    subroutine process_stack_link_var_list (stack, var_list)
        class(process_stack_t), intent(inout) :: stack
        type(var_list_t), intent(in), target :: var_list
        call stack%var_list%link (var_list)
    end subroutine process_stack_link_var_list

```

#### 28.4.4 Push

We take a process pointer and push it onto the stack. The previous pointer is nullified. Subsequently, the process is ‘owned’ by the stack and will be finalized when the stack is deleted.

```

⟨Process stacks: process stack: TBP⟩+≡
    procedure :: push => process_stack_push
⟨Process stacks: procedures⟩+≡
    subroutine process_stack_push (stack, process)
        class(process_stack_t), intent(inout) :: stack
        type(process_entry_t), intent(inout), pointer :: process
        process%next => stack%first
        stack%first => process
        process => null ()
        stack%n = stack%n + 1
    end subroutine process_stack_push

```

Initialize process variables for a given process ID, without setting values.

```

⟨Process stacks: process stack: TBP⟩+≡
    procedure :: init_result_vars => process_stack_init_result_vars
⟨Process stacks: procedures⟩+≡
    subroutine process_stack_init_result_vars (stack, id)
        class(process_stack_t), intent(inout) :: stack
        type(string_t), intent(in) :: id
        call var_list_init_num_id (stack%var_list, id)
        call var_list_init_process_results (stack%var_list, id)
    end subroutine process_stack_init_result_vars

```

Fill process variables with values. This is executed after the integration pass.

Note: We set only integral and error. With multiple MCI records possible, the results for `n_calls`, `chi2` etc. are not necessarily unique. (We might set the efficiency, though.)

```
<Process stacks: process stack: TBP>+≡
    procedure :: fill_result_vars => process_stack_fill_result_vars
<Process stacks: procedures>+≡
    subroutine process_stack_fill_result_vars (stack, id)
        class(process_stack_t), intent(inout) :: stack
        type(string_t), intent(in) :: id
        type(process_t), pointer :: process
        process => stack%get_process_ptr (id)
        if (associated (process)) then
            call var_list_init_num_id (stack%var_list, id, process%get_num_id ())
            if (process%has_integral ()) then
                call var_list_init_process_results (stack%var_list, id, &
                    integral = process%get_integral (), &
                    error = process%get_error ())
            end if
        else
            call msg_bug ("process_stack_fill_result_vars: unknown process ID")
        end if
    end subroutine process_stack_fill_result_vars
```

#### 28.4.5 Data Access

Tell if a process exists.

```
<Process stacks: process stack: TBP>+≡
    procedure :: exists => process_stack_exists
<Process stacks: procedures>+≡
    function process_stack_exists (stack, id) result (flag)
        class(process_stack_t), intent(in) :: stack
        type(string_t), intent(in) :: id
        logical :: flag
        type(process_t), pointer :: process
        process => stack%get_process_ptr (id)
        flag = associated (process)
    end function process_stack_exists
```

Return a pointer to a process with specific ID. Look also at a linked stack, if necessary.

```
<Process stacks: process stack: TBP>+≡
    procedure :: get_process_ptr => process_stack_get_process_ptr
<Process stacks: procedures>+≡
    recursive function process_stack_get_process_ptr (stack, id) result (ptr)
        class(process_stack_t), intent(in) :: stack
        type(string_t), intent(in) :: id
        type(process_t), pointer :: ptr
        type(process_entry_t), pointer :: entry
        ptr => null ()
```

```

entry => stack%first
do while (associated (entry))
    if (entry%get_id () == id) then
        ptr => entry%process_t
        return
    end if
    entry => entry%next
end do
if (associated (stack%next))  ptr => stack%next%get_process_ptr (id)
end function process_stack_get_process_ptr

```

#### 28.4.6 Unit tests

Test module, followed by the corresponding implementation module.

`(process_stacks_ut.f90)≡  
   ⟨File header⟩`

```

module process_stacks_ut
use unit_tests
use process_stacks_uti

```

*⟨Standard module head⟩*

*⟨Process stacks: public test⟩*

`contains`

*⟨Process stacks: test driver⟩*

```
end module process_stacks_ut
```

`(process_stacks_uti.f90)≡  
   ⟨File header⟩`

```

module process_stacks_uti

```

*⟨Use strings⟩*

```

use os_interface
use sm_qcd
use model_data
use process_libraries
use rng_base
use prc_test, only: prc_test_create_library
use processes
use processes_ut, only: prepare_test_process

```

```
use process_stacks
```

```
use rng_base_ut, only: rng_test_factory_t
```

*⟨Standard module head⟩*

*⟨Process stacks: test declarations⟩*

```

contains

⟨Process stacks: tests⟩

end module process_stacks_utl

```

API: driver for the unit tests below.

```

⟨Process stacks: public test⟩≡
    public :: process_stacks_test

⟨Process stacks: test driver⟩≡
    subroutine process_stacks_test (u, results)
        integer, intent(in) :: u
        type(test_results_t), intent(inout) :: results
    ⟨Process stacks: execute tests⟩
    end subroutine process_stacks_test

```

### Write an empty process stack

The most trivial test is to write an uninitialized process stack.

```

⟨Process stacks: execute tests⟩≡
    call test (process_stacks_1, "process_stacks_1", &
               "write an empty process stack", &
               u, results)

⟨Process stacks: test declarations⟩≡
    public :: process_stacks_1

⟨Process stacks: tests⟩≡
    subroutine process_stacks_1 (u)
        integer, intent(in) :: u
        type(process_stack_t) :: stack

        write (u, "(A)")    "* Test output: process_stacks_1"
        write (u, "(A)")    "* Purpose: display an empty process stack"
        write (u, "(A)")

        call stack%write (u)

        write (u, "(A)")
        write (u, "(A)")    "* Test output end: process_stacks_1"

    end subroutine process_stacks_1

```

### Fill a process stack

Fill a process stack with two (identical) processes.

```

⟨Process stacks: execute tests⟩+≡
    call test (process_stacks_2, "process_stacks_2", &
               "fill a process stack", &
               u, results)

```

```

<Process stacks: test declarations>+≡
public :: process_stacks_2

<Process stacks: tests>+≡
subroutine process_stacks_2 (u)
    integer, intent(in) :: u
    type(process_stack_t) :: stack
    type(process_library_t), target :: lib
    type(string_t) :: libname
    type(string_t) :: procname
    type(string_t) :: run_id
    type(os_data_t) :: os_data
    type(qcd_t) :: qcd
    class(rng_factory_t), allocatable :: rng_factory
    class(model_data_t), pointer :: model
    type(process_entry_t), pointer :: process => null ()

    write (u, "(A)")  "* Test output: process_stacks_2"
    write (u, "(A)")  "* Purpose: fill a process stack"
    write (u, "(A)")

    write (u, "(A)")  "* Build, initialize and store two test processes"
    write (u, "(A)")

    libname = "process_stacks2"
    procname = libname
    call os_data_init (os_data)
    allocate (rng_test_factory_t :: rng_factory)
    call prc_test_create_library (libname, lib)

    allocate (model)
    call model%init_test ()

    allocate (process)
    run_id = "run1"
    call process%init &
        (procname, run_id, lib, os_data, qcd, rng_factory, model)
    call stack%push (process)

    allocate (model)
    call model%init_test ()

    allocate (process)
    run_id = "run2"
    call process%init &
        (procname, run_id, lib, os_data, qcd, rng_factory, model)
    call stack%push (process)

    call stack%write (u)

    write (u, "(A)")
    write (u, "(A)")  "* Cleanup"

    call stack%final ()

```

```

    write (u, "(A)")
    write (u, "(A)")  "* Test output end: process_stacks_2"

end subroutine process_stacks_2

```

### Fill a process stack

Fill a process stack with two (identical) processes.

```

<Process stacks: execute tests>+≡
    call test (process_stacks_3, "process_stacks_3", &
               "process variables", &
               u, results)

<Process stacks: test declarations>+≡
    public :: process_stacks_3

<Process stacks: tests>+≡
    subroutine process_stacks_3 (u)
        integer, intent(in) :: u
        type(process_stack_t) :: stack
        type(model_data_t), target :: model
        type(string_t) :: procname
        type(process_entry_t), pointer :: process => null ()
        type(process_instance_t), target :: process_instance

        write (u, "(A)")  "* Test output: process_stacks_3"
        write (u, "(A)")  "* Purpose: setup process variables"
        write (u, "(A)")

        write (u, "(A)")  "* Initialize process variables"
        write (u, "(A)")

        procname = "processes_test"
        call model%init_test ()

        write (u, "(A)")  "* Initialize process variables"
        write (u, "(A)")

        call stack%init_var_list ()
        call stack%init_result_vars (procname)
        call stack%write_var_list (u)

        write (u, "(A)")
        write (u, "(A)")  "* Build and integrate a test process"
        write (u, "(A)")

        allocate (process)
        call prepare_test_process (process%process_t, process_instance, model)
        call process%integrate (process_instance, 1, 1, 1000)
        call process_instance%final ()
        call process%final_integration (1)
        call stack%push (process)

        write (u, "(A)")  "* Fill process variables"

```

```

write (u, "(A)")

```

# Chapter 29

## Matching

```
⟨matching_base.f90⟩≡  
⟨File header⟩  
  
module matching_base  
  
⟨Use strings⟩  
use diagnostics  
use sm_qcd  
use model_data  
use particles  
use variables  
use shower_base  
use processes  
use rng_base  
  
⟨Standard module head⟩  
  
⟨Matching base: public⟩  
  
⟨Matching base: parameters⟩  
  
⟨Matching base: types⟩  
  
⟨Matching base: interfaces⟩  
  
contains  
  
⟨Matching base: procedures⟩  
  
end module matching_base
```

### 29.1 Abstract Matching Type

A matching will need access to the `shower` as well as matrix elements that we currently get over `process_instance`. The `model` is intended for the backup `model_hadrons`.

```

⟨Matching base: public⟩≡
  public :: matching_t

⟨Matching base: types⟩≡
  type, abstract :: matching_t
    logical :: is_hadron_collision = .false.
    type(qcd_t), pointer :: qcd => null ()
    class(shower_base_t), pointer :: shower => null ()
    type(process_instance_t), pointer :: process_instance => null ()
    class(model_data_t), pointer :: model => null ()
    class(rng_t), allocatable :: rng
    type(string_t) :: process_name
    contains
      ⟨Matching base: matching: TBP⟩
end type matching_t

⟨Matching base: matching: TBP⟩≡
  procedure (matching_init), deferred :: init

⟨Matching base: interfaces⟩≡
  abstract interface
    subroutine matching_init (matching, var_list, process_name)
      import
      class(matching_t), intent(out) :: matching
      type(var_list_t), intent(in) :: var_list
      type(string_t), intent(in) :: process_name
    end subroutine matching_init
  end interface

```

If we use a polymorphic settings type, this boilerplate wouldn't be necessary but then we introduce `select type` statements all over the place.

```

⟨default matching init⟩≡
  type(var_list_t), intent(in) :: var_list
  type(string_t), intent(in) :: process_name
  call msg_debug (D_MATCHING, "matching_init")
  call matching%settings%init (var_list)
  matching%process_name = process_name

⟨Matching base: matching: TBP⟩+≡
  procedure (matching_write), deferred :: write

⟨Matching base: interfaces⟩+≡
  abstract interface
    subroutine matching_write (matching, unit)
      import
      class(matching_t), intent(in) :: matching
      integer, intent(in), optional :: unit
    end subroutine matching_write
  end interface

⟨Matching base: matching: TBP⟩+≡
  procedure :: import_rng => matching_import_rng

```

```

⟨Matching base: procedures⟩≡
    pure subroutine matching_import_rng (matching, rng)
        class(matching_t), intent(inout) :: matching
        class(rng_t), allocatable, intent(inout) :: rng
        call move_alloc (from = rng, to = matching%rng)
    end subroutine matching_import_rng

⟨Matching base: matching: TBP⟩+≡
    procedure :: connect => matching_connect
    procedure :: base_connect => matching_connect

⟨Matching base: procedures⟩+≡
    subroutine matching_connect (matching, process_instance, model, shower)
        class(matching_t), intent(inout) :: matching
        type(process_instance_t), intent(in), target :: process_instance
        class(model_data_t), intent(in), target :: model
        class(shower_base_t), intent(in), target :: shower
        call msg_debug (D_MATCHING, "matching_connect")
        matching%process_instance => process_instance

### 29.3 CKKW matching

This module contains the CKKW matching.

The type `ckkw_pseudo_shower_weights_t` gives the (relative) weights for different clusterings of the final particles, as given in Eq. (2.7) of hep-ph/0503281v1. Each particle has a binary labelling (power of 2) (first particle = 1, second particle = 2, third particle = 4, ...). Each recombination therefore corresponds to an integer, that is not a power of 2. For multiple subsequent recombinations, no different weights for different sequences of clustering are stored. It is assumed that the weight of a multiply recombined state is a combination of the states with one fewer recombination and that these states' contributions are proportional to their weights. For a  $2^- \rightarrow n$  event, the weights array thus has the size  $2^{(2+n)-1}$ . The `weights_by_type` array gives the weights depending on the type of the particle, the first index is the same as for weights, the second index gives the type of the new mother particle:

- 0: uncolored ( $\gamma, Z, W, \text{Higgs}$ )
- 1: colored (quark)
- 2: gluon
- 3: squark
- 4: gluino

`alphaS` gives the value for  $\alpha_s$  used in the generation of the matrix element. This is needed for the reweighting using the values for a running  $\alpha_s$  at the scales of the clusterings.

## 29.4 POWHEG

This module generates radiation according to the POWHEG Sudakov form factor

$$\Delta^{f_b}(\Phi_n, p_T) = \prod_{\alpha_r \in \{\alpha_r | f_b\}} \Delta_{\alpha_r}^{f_b}(\Phi_n, p_T), \quad (29.1)$$

with

$$\Delta_{\alpha_r}^{f_b}(\Phi_n, p_T) = \exp \left\{ - \left[ \int d\Phi_{\text{rad}} \frac{R(\Phi_{n+1})}{B^{f_b}(\Phi_n)} \theta(k_T(\Phi_{n+1}) - p_T) \right]_{\alpha_r}^{\Phi_n^{\alpha_r} = \Phi_n} \right\} \quad (29.2)$$

We expect that an underlying Born flavor structure  $f_b$  has been generated with a probability proportional to its contribution to the  $\tilde{B}$  at the given kinematic point.

#### 29.4.1 Base types for settings and data

`lambda` enters for now as the lowest scale  $2\Lambda(5)_{\bar{M}S}$  where the radiation  $\alpha_s^{\text{rad}}$  is still larger than the true  $\alpha_s$ .

```

⟨POWHEG matching: public⟩≡
  public :: powheg_settings_t

⟨POWHEG matching: types⟩≡
  type :: powheg_settings_t
    real(default) :: pt2_min = zero
    real(default) :: lambda = zero
    integer :: n_init = 0
    integer :: size_grid_xi = 0
    integer :: size_grid_y = 0
    integer :: upper_bound_func = UBF_SIMPLE
    logical :: rebuild_grids = .false.
    logical :: test_sudakov = .false.
    logical :: singular_jacobian = .false.
contains
  ⟨POWHEG matching: powheg settings: TBP⟩
end type powheg_settings_t

```

These are the possible values for `upper_bound_func` and will be used to decide which ubf object is allocated.

```

⟨POWHEG matching: parameters⟩≡
  integer, parameter :: UBF_SIMPLE = 1
  integer, parameter :: UBF_EEQQ = 2
  integer, parameter :: UBF_MASSIVE = 3

```

```

end subroutine powheg_settings_write

```

To be able to test the powheg class independently, we set up a type that contains the necessary dummy information:

```

⟨POWHEG matching: public⟩+≡
public :: powheg_testing_t

⟨POWHEG matching: types⟩+≡
type :: powheg_testing_t
  integer :: n_alr, n_in, n_out_born, n_out_real
  real(default) :: sqme_born
  logical :: active = .false.
end type powheg_testing_t

```

```

<POWHEG matching: public>+≡
    public :: radiation_t

<POWHEG matching: types>+≡
    type :: radiation_t
        real(default) :: xi, y, phi, pt2
        integer :: alr
        logical :: valid = .false.
    contains
        <POWHEG matching: radiation: TBP>
    end type radiation_t

<POWHEG matching: radiation: TBP>≡
    procedure :: write => radiation_write

<POWHEG matching: procedures>+≡
    subroutine radiation_write (radiation, unit)
        class(radiation_t), intent(in) :: radiation
        integer, intent(in), optional :: unit
        integer :: u
        u = given_output_unit (unit);  if (u < 0)  return
        write (u, "(1X, A)") "Radiation:"
        write (u, "(3X, A," // FMT_16 // ")") "xi = ", radiation%xi
        write (u, "(3X, A," // FMT_16 // ")") "y = ", radiation%y
        write (u, "(3X, A," // FMT_16 // ")") "phi = ", radiation%phi
        write (u, "(3X, A," // FMT_16 // ")") "pt2 = ", radiation%pt2
        write (u, "(3X, A, I12)") "alr = ", radiation%alr
    end subroutine radiation_write

lambda2_gen ≠ lambda and is used in the upper bounding functions.

<POWHEG matching: public>+≡

  end subroutine sudakov_write

```

To allow for arrays of this class

```

<POWHEG matching: public>+≡
  public :: sudakov_wrapper_t
<POWHEG matching: types>+≡
  type :: sudakov_wrapper_t
    class(sudakov_t), allocatable :: s
  end type sudakov_wrapper_t

<POWHEG matching: sudakov: TBP>+≡
  procedure :: init => sudakov_init
<POWHEG matching: procedures>+≡
  subroutine sudakov_init (sudakov, process_deps, event_deps, &
    powheg_settings, phs_fks_generator, qcd, rng)
    class(sudakov_t), intent(out) :: sudakov
    type(process_deps_t), target, intent(in) :: process_deps
    type(event_deps_t), target, intent(in) :: event_deps
    type(powheg_settings_t), target, intent(in) :: powheg_settings
    type(phs_fks_generator_t), target, intent(in) :: phs_fks_generator
    type(qcd_t), target, intent(in) :: qcd
    class(rng_t), target, intent(in) :: rng
    sudakov%process_deps => process_deps
    sudakov%event_deps => event_deps
    sudakov%powheg_settings => powheg_settings
    sudakov%phs_fks_generator => phs_fks_generator
    sudakov%qcd => qcd
    sudakov%rng => rng

```

```
end subroutine sudakov_init
```

This has to be done after the grids are initialized.

```
(POWHEG matching: sudakov: TBP)+≡
procedure :: set_normalization => sudakov_set_normalization
(POWHEG matching: procedures)+≡
pure subroutine sudakov_set_normalization (sudakov, norm_max)
  class(sudakov_t), intent(inout) :: sudakov
  real(default), intent(in) :: norm_max
  sudakov%norm_max = norm_max
end subroutine sudakov_set_normalization

(POWHEG matching: sudakov: TBP)+≡
procedure :: update => sudakov_update
(POWHEG matching: procedures)+≡
pure subroutine sudakov_update (sudakov, xi2_max)
  class(sudakov_t), intent(inout) :: sudakov
  real(default), intent(in) :: xi2_max
  sudakov%xi2_max = xi2_max
end subroutine sudakov_update
```

`upper_bound_func` does *not* contain the normalization  $N$  which is given by the grids. In the notation of 1002.2581, it is thus  $\frac{1}{N}U(\xi, y)$

```
(POWHEG matching: sudakov: TBP)+≡
procedure (sudakov_upper_bound_func), deferred :: upper_bound_func
(POWHEG matching: interfaces)+≡
abstract interface
  pure function sudakov_upper_bound_func (sudakov, xi, y, alpha_s) result (u)
    import
    real(default) :: u
    class(sudakov_t), intent(in) :: sudakov
    real(default), intent(in) :: xi, y, alpha_s
  end function sudakov_upper_bound_func
end interface
```

Similar to the `upper_bound_func`, this is  $-\frac{1}{N} \log \Delta(p_T^2)$  where

$$\Delta^{(U)}(p_T) = \exp - \int U(\xi, y) \theta(k_T - p_T) d\xi dy d\phi \quad (29.3)$$

```

We have to solve the equation

$$\frac{\log \Delta^{(U)}(p_T)}{\log \Delta^{(U)}(p_T^{\max})} = \log \Delta^{(U)}(p_T) = \log r_1$$

iteratively for  $p_T$ . If the current emission is not accepted, in the next step it is  $\log \Delta^{(U)}(p_T^{\max}) = \log r_1$ , so that we have to solve the equation

$$\log \Delta^{(U)}(p_T) = \log r_1 + \log r_2$$

using the second random number  $r_2$ .

```

## Simple FSR

This corresponds to Appendix C of 1002.2581

```
(POWHEG matching: public) +≡
  public :: sudakov_simple_fsr_t
(POWHEG matching: types) +≡
  type, extends (sudakov_t) :: sudakov_simple_fsr_t
  contains
    (POWHEG matching: sudakov simple fsr: TBP)
  end type sudakov_simple_fsr_t
```

The simplest upper bounding function for final-state radiation is

$$\text{upper_bound_func} = \frac{U(\xi, y)}{N} = \frac{\alpha_s}{\xi(1 - y)} \quad (29.4)$$

```
(POWHEG matching: sudakov simple fsr: TBP) ≡
  procedure :: upper_bound_func => sudakov_simple_fsr_upper_bound_func
(POWHEG matching: procedures) +≡
  pure function sudakov_simple_fsr_upper_bound_func (sudakov, xi, y, alpha_s) result (u)
    real(default) :: u
    class(sudakov_simple_fsr_t), intent(in) :: sudakov
    real(default), intent(in) :: xi, y, alpha_s
    u = alpha_s / (xi * (1 - y))
  end function sudakov_simple_fsr_upper_bound_func
```

The above upper bounding function corresponds to the transverse momentum scale

$$k_T^2 = \frac{s}{2}\xi^2(1 - y). \quad (29.5)$$

```
(POWHEG matching: sudakov simple fsr: TBP) +≡
  procedure :: kt2 => sudakov_simple_fsr_kt2
(POWHEG matching: procedures) +≡
  function sudakov_simple_fsr_kt2 (sudakov, xi, y) result (kt2)

## Massive FSR

```

<POWHEG matching: public>+≡
public :: sudakov_massive_fsr_t

```

```

⟨POWHEG matching: types⟩+≡
  type, extends (sudakov_t) :: sudakov_massive_fsr_t
    real(default) :: z, z1, z2 = 0._default
    real(default) :: xi_1, xi_min, xi_m = 0._default
    real(default) :: xi_max_extended = 1._default
  contains
  ⟨POWHEG matching: sudakov massive fsr: TBP⟩
end type sudakov_massive_fsr_t

```

During the radiation generation, an alternative expression for  $\xi_{\max}$ ,

$$\xi_{\max} = 1 - \frac{(m + m_{\text{rec}})^2}{q^2},$$

is used, which corresponds to an extended Dalitz region. Phase space points outside of the original Dalitz region will be vetoed afterwards.

```

⟨POWHEG matching: sudakov massive fsr: TBP⟩≡
  procedure :: compute_xi_max_extended &
    => sudakov_massive_fsr_compute_xi_max_extended

⟨POWHEG matching: procedures⟩+≡
  subroutine sudakov_massive_fsr_compute_xi_max_extended (sudakov)
    class(sudakov_massive_fsr_t), intent(inout) :: sudakov
    real(default) :: m, mrec
    real(default) :: q0
    q0 = sqrt(sudakov%event_deps%s_hat)
    associate (p => sudakov%event_deps%p_born(sudakov%associated_emitter))
      m = p**1
      mrec = sqrt ((q0-p(0))**2 - p(1)**2 - p(2)**2 - p(3)**2)
    end associate
    sudakov%xi_max_extended = one - (m + mrec)**2 / q0**2
  end subroutine sudakov_massive_fsr_compute_xi_max_extended

```

For massive emitters, the radiation variable  $\xi$  is constructed as follows. First,

$$\xi_{\min}(k_T^2) = \frac{\sqrt{k_T^2(k_T^2z_2^2 + 8\bar{p}^0q(1-z_2)} - k_T^2z_2}{2q^2(1-z_2)} \quad (29.7)$$

is computed. Then  $\xi_1$  is computed according to the same equation with  $z_2 \leftrightarrow z_1$ . Finally,  $\xi$  is generated according to

$$\xi = \frac{1}{q^2} \exp \left[ \log (\xi_{\min} q^2 - k_T^2) + r \log \frac{\xi_m q^2 - k_T^2}{\xi_{\min} q^2 - k_T^2} + k_T^2 \right], \quad (29.8)$$

where  $\xi_m = \min(\xi_{\max}, \xi_1)$ .

```

### Generation algorithm and grid initialization

`compute_sqme_real` is the projected real matrix element  $R_{\alpha_r} = S_{\alpha_r} R$  whereby the current  $\alpha_r$  is implied by the `emitter`. Furthermore, it is multiplied by the Jacobian.

```

For each underlying Born  $f_b$ , there is a number of radiation regions. A radiation region  $rr$  may correspond multiple  $\alpha_r$ s. The phase space only depends upon the radiation region kinematics  $rr$  and not on the specific  $\alpha_r$ .  $\alpha_r$  can be picked in the set  $\{\alpha_r | f_b, rr\}$  proportional to their  $R_{\alpha_r}$ . For now, we simplify things though and just work with the  $\alpha_r$ .

The following is valid for one underlying Born.

```

#### 29.4.4 $\alpha_s$ and its reweighting

The main point to ensure here is that the simple fixed-flavor-1-loop expression  $\alpha_s^{\text{rad}}$  is larger than the more accurate  $\alpha_s$  such that we can use a reweighting veto and use  $\alpha_s^{\text{rad}}$  for the generation of the emission. This can be done by setting

$$\alpha_s^{\text{rad}}(\mu_0) = \alpha_s(\mu_0) \quad (29.13)$$

whereby  $\mu_0^2$  is the `scale_to_relate2` that is taken to be  $p_{T,\min}^2$ .

# Chapter 30

# Event Implementation

With a process object and the associated methods at hand, we can generate events for elementary processes and, by subsequent transformation, for complete physical processes.

We have the following modules:

**event\_transforms** Abstract base type for transforming a physical process with process instance and included evaluators, etc., into a new object. The following modules extend this base type.

**decays** Combine the elementary process with elementary decay processes and thus transform the elementary event into a decayed event, still at the parton level.

**showers** Create QED/QCD showers out of the partons that are emitted by elementary processes. This should be interleaved with showering of radiated particles (structure functions) and multiple interactions.

**hadrons** (not implemented yet) Apply hadronization to the partonic events, interleaved with hadron decays. (The current setup relies on hadronizing partonic events externally.)

**tau\_decays** (not implemented yet) Let  $\tau$  leptons decay taking full spin correlations into account.

**events** Combine all pieces to generate full events.

**eio\_raw** Raw I/O for complete events.

## 30.1 Abstract Event Transforms

⟨Event transforms: public⟩

⟨Event transforms: types⟩

⟨Event transforms: interfaces⟩

contains

⟨Event transforms: procedures⟩

end module event_transforms

```

### 30.1.1 Abstract base type

Essentially, all methods are abstract, but some get minimal base versions. We know that there will be a random-number generator at top level, and that we will relate to an elementary process.

The model is stored separately. It may contain modified setting that differ from the model instance stored in the process object.

Each event transform contains a particle set that it can fill for further use. There is a flag that indicates this.

We will collect event transforms in a list, therefore we include `previous` and `next` pointers.

```

⟨Event transforms: public⟩≡
public :: evt_t

⟨Event transforms: types⟩≡
type, abstract :: evt_t
    type(process_t), pointer :: process => null ()
    type(process_instance_t), pointer :: process_instance => null ()
    class(model_data_t), pointer :: model => null ()
    class(rng_t), allocatable :: rng
    integer :: rejection_count = 0
    logical :: particle_set_exists = .false.
    type(particle_set_t) :: particle_set
    class(evt_t), pointer :: previous => null ()
    class(evt_t), pointer :: next => null ()
    real(default) :: weight = 0._default
    logical :: only_weighted_events = .false.

```

```

contains
<Event transforms: evt: TBP>
end type evt_t

<Event transforms: evt: TBP>≡
procedure :: final => evt_final
procedure :: base_final => evt_final

<Event transforms: procedures>≡
subroutine evt_final (evt)
class(evt_t), intent(inout) :: evt
if (allocated (evt%rng)) call evt%rng%final ()
if (evt%particle_set_exists) &
    call evt%particle_set%final ()
end subroutine evt_final

<Event transforms: evt: TBP>+≡
procedure (evt_write), deferred :: write

<Event transforms: interfaces>≡
abstract interface
subroutine evt_write (evt, unit, verbose, more_verbose, testflag)
import
class(evt_t), intent(in) :: evt
integer, intent(in), optional :: unit
logical, intent(in), optional :: verbose, more_verbose, testflag
end subroutine evt_write
end interface

```

Output. We can print r.n.g. info.

```

<Event transforms: evt: TBP>+≡
procedure :: base_write => evt_base_write

<Event transforms: procedures>+≡
subroutine evt_base_write (evt, unit, testflag, show_set)
class(evt_t), intent(in) :: evt
integer, intent(in), optional :: unit
logical, intent(in), optional :: testflag, show_set
integer :: u
logical :: show
u = given_output_unit (unit)
show = .true.; if (present (show_set)) show = show_set
if (associated (evt%process)) then
    write (u, "(3x,A,A,A)")    "Associated process: '", &
        char (evt%process%get_id (), ","
end if
if (allocated (evt%rng)) then
    call evt%rng%write (u, 1)
    write (u, "(3x,A,I0)")    "Number of tries = ", evt%rejection_count
end if
if (show) then
    if (evt%particle_set_exists) then

```

```

        call write_separator (u)
        call evt%particle_set%write (u, testflag = testflag)
    end if
end if
end subroutine evt_base_write

```

Connect the transform with a process instance (and thus with the associated process). Use this to allocate the master random-number generator.

This is not an initializer; we may initialize the transform by implementation-specific methods.

```

<Event transforms: evt: TBP>+≡
procedure :: connect => evt_connect
procedure :: base_connect => evt_connect

<Event transforms: procedures>+≡
subroutine evt_connect (evt, process_instance, model, process_stack)
    class(evt_t), intent(inout), target :: evt
    type(process_instance_t), intent(in), target :: process_instance
    class(model_data_t), intent(in), target :: model
    type(process_stack_t), intent(in), optional :: process_stack
    evt%process => process_instance%process
    evt%process_instance => process_instance
    evt%model => model
    call evt%process%make_rng (evt%rng)
end subroutine evt_connect

```

Reset internal state.

```

<Event transforms: evt: TBP>+≡
procedure :: reset => evt_reset
procedure :: base_reset => evt_reset

<Event transforms: procedures>+≡
subroutine evt_reset (evt)
    class(evt_t), intent(inout) :: evt
    evt%rejection_count = 0
    evt%particle_set_exists = .false.
end subroutine evt_reset

```

Prepare for a new event: reset internal state, if necessary. We provide MCI and term index of the parent process.

```

<Event transforms: evt: TBP>+≡
procedure (evt_prepare_new_event), deferred :: prepare_new_event

<Event transforms: interfaces>+≡
interface
    subroutine evt_prepare_new_event (evt, i_mci, i_term)
        import
        class(evt_t), intent(inout) :: evt
        integer, intent(in) :: i_mci, i_term
    end subroutine evt_prepare_new_event
end interface

```

Generate a weighted event, using a valid initiator event in the process instance, and the random-number generator. The returned event probability should be a number between zero and one that we can use for rejection.

```
<Event transforms: evt: TBP>+≡
procedure (evt_generate_weighted), deferred :: generate_weighted
<Event transforms: interfaces>+≡
abstract interface
    subroutine evt_generate_weighted (evt, probability)
        import
        class(evt_t), intent(inout) :: evt
        real(default), intent(inout) :: probability
    end subroutine evt_generate_weighted
end interface
```

The unweighted event generation routine is actually implemented. It uses the random-number generator for simple rejection. Of course, the implementation may override this and implement a different way of generating an unweighted event.

```
<Event transforms: evt: TBP>+≡
procedure :: generate_unweighted => evt_generate_unweighted
procedure :: base_generate_unweighted => evt_generate_unweighted
<Event transforms: procedures>+≡
subroutine evt_generate_unweighted (evt)
    class(evt_t), intent(inout) :: evt
    real(default) :: p, x
    evt%rejection_count = 0
    REJECTION: do
        evt%rejection_count = evt%rejection_count + 1
        call evt%generate_weighted (p)
        if (signal_is_pending ()) return
        call evt%rng%generate (x)
        if (x < p) exit REJECTION
    end do REJECTION
end subroutine evt_generate_unweighted
```

Make a particle set. This should take the most recent evaluator (or whatever stores the event), factorize the density matrix if necessary, and store as a particle set.

If applicable, the factorization should make use of the `factorization_mode` and `keep_correlations` settings.

The values `r`, if set, should control the factorization in more detail, e.g., bypassing the random-number generator.

```
<Event transforms: evt: TBP>+≡
procedure (evt_make_particle_set), deferred :: make_particle_set
<Event transforms: interfaces>+≡
interface
    subroutine evt_make_particle_set &
        (evt, factorization_mode, keep_correlations, r)
        import
        class(evt_t), intent(inout) :: evt
```

```

    integer, intent(in) :: factorization_mode
    logical, intent(in) :: keep_correlations
    real(default), dimension(:), intent(in), optional :: r
  end subroutine evt_make_particle_set
end interface

```

Copy an existing particle set into the event record. This bypasses all methods to evaluate the internal state, but may be sufficient for further processing.

```

<Event transforms: evt: TBP>+≡
  procedure :: set_particle_set => evt_set_particle_set
<Event transforms: procedures>+≡
  subroutine evt_set_particle_set (evt, particle_set, i_mci, i_term)
    class(evt_t), intent(inout) :: evt
    type(particle_set_t), intent(in) :: particle_set
    integer, intent(in) :: i_term, i_mci
    call evt%prepare_new_event (i_mci, i_term)
    evt%particle_set = particle_set
    evt%particle_set_exists = .true.
  end subroutine evt_set_particle_set

```

This procedure can help in the previous task, if the particles are available in the form of an interaction object. (We need two interactions, one with color summed over, and one with the probability distributed among flows.)

We use the two values from the random number generator for factorizing the state. For testing purposes, we can provide those numbers explicitly.

```

<Event transforms: evt: TBP>+≡
  procedure :: factorize_interactions => evt_factorize_interactions
<Event transforms: procedures>+≡
  subroutine evt_factorize_interactions &
    (evt, int_matrix, int_flows, factorization_mode, keep_correlations, r)
    class(evt_t), intent(inout) :: evt
    type(interaction_t), intent(in), target :: int_matrix, int_flows
    integer, intent(in) :: factorization_mode
    logical, intent(in) :: keep_correlations
    real(default), dimension(:, ), intent(in), optional :: r
    real(default), dimension(2) :: x
    if (present (r)) then
      if (size (r) == 2) then
        x = r
      else
        call msg_bug ("event factorization: size of r array must be 2")
      end if
    else
      call evt%rng%generate (x)
    end if
    call evt%particle_set%init (evt%particle_set_exists, &
      int_matrix, int_flows, factorization_mode, x, &
      keep_correlations, keep_virtual=.true.)
    evt%particle_set_exists = .true.
  end subroutine evt_factorize_interactions

```

Mark the incoming particles as incoming in the particle set. This is necessary because in the interaction objects they are usually marked as virtual.

In the inquiry functions we set the term index to one; the indices of beams and incoming particles should be identical for all process terms.

We use the initial elementary process for obtaining the indices. Thus, we implicitly assume that the beam and incoming indices stay the same across event transforms. If this is not true for a transform (say, MPI), it should override this method.

```
<Event transforms: evt: TBP>+≡
procedure :: tag_incoming => evt_tag_incoming
<Event transforms: procedures>+≡
subroutine evt_tag_incoming (evt)
  class(evt_t), intent(inout) :: evt
  integer :: i_term, n_in
  integer, dimension(:), allocatable :: beam_index, in_index
  n_in = evt%process%get_n_in ()
  i_term = 1
  allocate (beam_index (n_in))
  call evt%process_instance%get_beam_index (i_term, beam_index)
  call evt%particle_set%reset_status (beam_index, PRT_BEAM)
  allocate (in_index (n_in))
  call evt%process_instance%get_in_index (i_term, in_index)
  call evt%particle_set%reset_status (in_index, PRT_INCOMING)
end subroutine evt_tag_incoming
```

### 30.1.2 Implementation: Trivial transform

This transform contains just a pointer to process and process instance. The `generate` methods do nothing.

```
<Event transforms: public>+≡
public :: evt_trivial_t
<Event transforms: types>+≡
type, extends (evt_t) :: evt_trivial_t
contains
<Event transforms: evt trivial: TBP>
end type evt_trivial_t
```

The finalizer is trivial. Some output:

```
<Event transforms: evt trivial: TBP>≡
procedure :: write => evt_trivial_write
<Event transforms: procedures>+≡
subroutine evt_trivial_write (evt, unit, verbose, more_verbose, testflag)
  class(evt_trivial_t), intent(in) :: evt
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: verbose, more_verbose, testflag
  integer :: u
  u = given_output_unit (unit)
  call write_separator (u, 2)
  write (u, "(1x,A)") "Event transform: trivial (hard process)"
```

```

    call write_separator (u)
    call evt%base_write (u, testflag = testflag)
end subroutine evt_trivial_write

```

Nothing to do here:

```

<Event transforms: evt trivial: TBP>+≡
    procedure :: prepare_new_event => evt_trivial_prepare_new_event
<Event transforms: procedures>+≡
    subroutine evt_trivial_prepare_new_event (evt, i_mci, i_term)
        class(evt_trivial_t), intent(inout) :: evt
        integer, intent(in) :: i_mci, i_term
        call evt%reset ()
    end subroutine evt_trivial_prepare_new_event

```

The weighted generator is, surprisingly, trivial.

```

<Event transforms: evt trivial: TBP>+≡
    procedure :: generate_weighted => evt_trivial_generate_weighted
<Event transforms: procedures>+≡
    subroutine evt_trivial_generate_weighted (evt, probability)
        class(evt_trivial_t), intent(inout) :: evt
        real(default), intent(inout) :: probability
        probability = 1
    end subroutine evt_trivial_generate_weighted

```

This routine makes a particle set, using the associated process instance as-is.

```

<Event transforms: evt trivial: TBP>+≡
    procedure :: make_particle_set => evt_trivial_make_particle_set
<Event transforms: procedures>+≡
    subroutine evt_trivial_make_particle_set &
        (evt, factorization_mode, keep_correlations, r)
        class(evt_trivial_t), intent(inout) :: evt
        integer, intent(in) :: factorization_mode
        logical, intent(in) :: keep_correlations
        real(default), dimension(:), intent(in), optional :: r
        integer :: i_term
        type(interaction_t), pointer :: int_matrix, int_flows
        if (evt%process_instance%is_complete_event ()) then
            call evt%process_instance%select_i_term (i_term)
            int_matrix => evt%process_instance%get_matrix_int_ptr (i_term)
            int_flows  => evt%process_instance%get_flows_int_ptr (i_term)
            call evt%factorize_interactions (int_matrix, int_flows, &
                factorization_mode, keep_correlations, r)
            call evt%tag_incoming ()
        else
            call msg_bug ("Event factorization: event is incomplete")
        end if
    end subroutine evt_trivial_make_particle_set

```

### 30.1.3 Unit tests

Test module, followed by the corresponding implementation module.

`(event_transforms_ut.f90)≡  
  ⟨File header⟩`

```
module event_transforms_ut
  use unit_tests
  use event_transforms_uti

  ⟨Standard module head⟩

  ⟨Event transforms: public test⟩

contains

  ⟨Event transforms: test driver⟩

end module event_transforms_ut

⟨event_transforms_uti.f90)≡
⟨File header⟩

### 30.2.5 Hadronization Event Transform

This is the type for the hadronization event transform. It does not depend on the specific hadronization implementation of `hadrons_t`.

```

⟨Hadrons: public⟩+≡
public :: evt_hadrons_t
⟨Hadrons: types⟩+≡
type, extends (evt_t) :: evt_hadrons_t
    class(hadrons_t), allocatable :: hadrons
    type(model_t), pointer :: model_hadrons => null()
    type(qcd_t), pointer :: qcd_t => null()
    logical :: is_first_event

```

```

contains
<Hadrons: evt hadrons: TBP>
end type evt_hadrons_t
```

Initialize the parameters. The `model_hadrons` is supposed to be the SM variant that contains all hadrons that may be generated in the shower.

```

<Hadrons: evt hadrons: TBP>≡
procedure :: init => evt_hadrons_init
<Hadrons: procedures>+≡
subroutine evt_hadrons_init (evt, settings, model_hadrons, method)
  class(evt_hadrons_t), intent(out) :: evt
  type(shower_settings_t), intent(in) :: settings
  type(model_t), intent(in), target :: model_hadrons
  type(string_t), intent(in) :: method
  evt%model_hadrons => model_hadrons
  !!! TODO: (bcn 2015-03-27) method should be part of hadronization settings
  select case (char (method))
  case ("PYTHIA6")
    allocate (hadrons_pythia6_t :: evt%hadrons)
  case ("PYTHIA8")
    allocate (hadrons_pythia8_t :: evt%hadrons)
  case default

```

### 30.4.1 Final-State Particle Configuration

A final-state particle may be either stable or unstable. Here is an empty abstract type as the parent of both, with holds just the flavor information.

```

⟨Decays: types⟩≡
  type, abstract :: any_config_t
    private
    contains
      ⟨Decays: any config: TBP⟩
  end type any_config_t

```

Finalizer, depends on the implementation.

```

⟨Decays: any config: TBP⟩≡
  procedure (any_config_final), deferred :: final
⟨Decays: interfaces⟩≡
  interface
    subroutine any_config_final (object)
      import
      class(any_config_t), intent(inout) :: object
    end subroutine any_config_final
  end interface

```

The output is also deferred:

```

⟨Decays: any config: TBP⟩+≡
  procedure (any_config_write), deferred :: write
⟨Decays: interfaces⟩+≡
  interface
    subroutine any_config_write (object, unit, indent, verbose)
      import
      class(any_config_t), intent(in) :: object
      integer, intent(in), optional :: unit, indent
      logical, intent(in), optional :: verbose
    end subroutine any_config_write
  end interface

```

This is a container for a stable or unstable particle configurator. We need this wrapper for preparing arrays that mix stable and unstable particles.

```
{Decays: types}+≡
  type :: particle_config_t
    private
      class(any_config_t), allocatable :: c
  end type particle_config_t
```

### 30.4.2 Final-State Particle

In theory, for the particle instance we only need to consider the unstable case. However, it is more straightforward to treat configuration and instance on the same footing, and to introduce a wrapper for particle objects as above. This also works around a compiler bug in gfortran.

```
{Decays: types}+≡
  type, abstract :: any_t
    private
    contains
      {Decays: any: TBP}
  end type any_t
```

Finalizer, depends on the implementation.

```
{Decays: any: TBP}≡
  procedure (any_final), deferred :: final
{Decays: interfaces}+≡
  interface
    subroutine any_final (object)
      import
      class(any_t), intent(inout) :: object
    end subroutine any_final
  end interface
```

The output is also deferred:

```
{Decays: any: TBP}+≡
  procedure (any_write), deferred :: write
{Decays: interfaces}+≡
  interface
    subroutine any_write (object, unit, indent)
      import
      class(any_t), intent(in) :: object
      integer, intent(in), optional :: unit, indent
    end subroutine any_write
  end interface
```

This is a container for a stable or unstable outgoing particle. We need this wrapper for preparing arrays that mix stable and unstable particles.

```
{Decays: types}+≡
  type :: particle_out_t
    private
```

```

    class(any_t), allocatable :: c
end type particle_out_t

```

### 30.4.3 Decay Term Configuration

A decay term is a distinct final state, corresponding to a process term. Each decay process may give rise to several terms with, possibly, differing flavor content.

```

<Decays: types>+≡
  type :: decay_term_config_t
    private
    type(particle_config_t), dimension(:), allocatable :: prt
    contains
      <Decays: decay term config: TBP>
  end type decay_term_config_t

```

Finalizer, recursive.

```

<Decays: decay term config: TBP>≡
  procedure :: final => decay_term_config_final

<Decays: procedures>≡
  recursive subroutine decay_term_config_final (object)
    class(decay_term_config_t), intent(inout) :: object
    integer :: i
    if (allocated (object%prt)) then
      do i = 1, size (object%prt)
        if (allocated (object%prt(i)%c)) call object%prt(i)%c%final ()
      end do
    end if
  end subroutine decay_term_config_final

```

Output, with optional indentation

```

<Decays: decay term config: TBP>+≡
  procedure :: write => decay_term_config_write

<Decays: procedures>+≡
  recursive subroutine decay_term_config_write (object, unit, indent, verbose)
    class(decay_term_config_t), intent(in) :: object
    integer, intent(in), optional :: unit, indent
    logical, intent(in), optional :: verbose
    integer :: i, j, u, ind
    logical :: verb
    u = given_output_unit (unit)
    ind = 0; if (present (indent)) ind = indent
    verb = .true.; if (present (verbose)) verb = verbose
    call write_indent (u, ind)
    write (u, "(1x,A)", advance="no") "Final state:"
    do i = 1, size (object%prt)
      select type (prt_config => object%prt(i)%c)
      type is (stable_config_t)
        write (u, "(1x,A)", advance="no") &
          char (prt_config%flv(1)%get_name ())
    end do
  end subroutine decay_term_config_write

```

```

do j = 2, size (prt_config%flv)
    write (u, "(:',A)", advance="no") &
        char (prt_config%flv(j)%get_name ())
end do
type is (unstable_config_t)
    write (u, "(ix,A)", advance="no") &
        char (prt_config%flv%get_name ())
end select
end do
write (u, *)
if (verb) then
    do i = 1, size (object%prt)
        call object%prt(i)%c%write (u, ind)
    end do
end if
end subroutine decay_term_config_write

```

Initialize, given a set of flavors. For each flavor, we must indicate whether the particle is stable. The second index of the flavor array runs over alternatives for each decay product; alternatives are allowed only if the decay product is itself stable.

```

<Decays: decay term config: TBP>+≡

        end select
    end do
end subroutine decay_term_config_compute

```

#### 30.4.4 Decay Term

A decay term instance is selected when we generate an event for the associated process instance. When evaluated, it triggers further decays down the chain.

Only unstable products are allocated as child particles.

```

⟨Decays: types⟩+≡
type :: decay_term_t
    private
    type(decay_term_config_t), pointer :: config => null ()
    type(particle_out_t), dimension(:), allocatable :: particle_out
contains
    ⟨Decays: decay term: TBP⟩
end type decay_term_t

```

Finalizer.

```

⟨Decays: decay term: TBP⟩≡
procedure :: final => decay_term_final
⟨Decays: procedures⟩+≡
recursive subroutine decay_term_final (object)
    class(decay_term_t), intent(inout) :: object
    integer :: i
    if (allocated (object%particle_out)) then
        do i = 1, size (object%particle_out)
            call object%particle_out(i)%c%final ()
        end do
    end if
end subroutine decay_term_final

```

Output.

```
<Decays: decay term: TBP>+≡
    procedure :: write => decay_term_write
<Decays: procedures>+≡
    recursive subroutine decay_term_write (object, unit, indent)
        class(decay_term_t), intent(in) :: object
        integer, intent(in), optional :: unit, indent
        integer :: i, u, ind
        u = given_output_unit (unit)
        ind = 0; if (present (indent)) ind = indent
        call object%config%write (u, ind, verbose = .false.)
        do i = 1, size (object%particle_out)
            call object%particle_out(i)%c%write (u, ind)
        end do
    end subroutine decay_term_write
```

Recursively write the embedded process instances.

```
<Decays: decay term: TBP>+≡
    procedure :: write_process_instances => decay_term_write_process_instances
<Decays: procedures>+≡
    recursive subroutine decay_term_write_process_instances (term, unit, verbose)
        class(decay_term_t), intent(in) :: term
        integer, intent(in), optional :: unit
        logical, intent(in), optional :: verbose
        integer :: i
        do i = 1, size (term%particle_out)
            select type (unstable => term%particle_out(i)%c)
            type is (unstable_t)
                call unstable%write_process_instances (unit, verbose)
            end select
        end do
    end subroutine decay_term_write_process_instances
```

Initialization, using the configuration object. We allocate particle objects in parallel to the particle configuration objects which we use to initialize them, one at a time.

```
<Decays: decay term: TBP>+≡
    procedure :: init => decay_term_init
<Decays: procedures>+≡
    recursive subroutine decay_term_init (term, config)
        class(decay_term_t), intent(out) :: term
        type(decay_term_config_t), intent(in), target :: config
        integer :: i
        term%config => config
        allocate (term%particle_out (size (config%prt)))
        do i = 1, size (config%prt)
            select type (prt_config => config%prt(i)%c)
            type is (stable_config_t)

            end select
        end do
    end subroutine decay_term_generate

```

### 30.4.5 Decay Root Configuration

At the root of a decay chain, there is a parent process. The decay root stores a pointer to the parent process and the set of decay configurations.

```

⟨Decays: public⟩≡
    public :: decay_root_config_t

⟨Decays: types⟩+≡
    type :: decay_root_config_t
        private
        type(string_t) :: process_id
        type(process_t), pointer :: process => null ()
        class(model_data_t), pointer :: model => null ()
        type(decay_term_config_t), dimension(:), allocatable :: term_config
        contains
            ⟨Decays: decay root config: TBP⟩
    end type decay_root_config_t

```

The finalizer is recursive since there may be cascade decays.

```

⟨Decays: decay root config: TBP⟩≡
    procedure :: final => decay_root_config_final

```

```

⟨Decays: procedures⟩+≡
recursive subroutine decay_root_config_final (object)
  class(decay_root_config_t), intent(inout) :: object
  integer :: i
  if (allocated (object%term_config)) then
    do i = 1, size (object%term_config)
      call object%term_config(i)%final ()
    end do
  end if
end subroutine decay_root_config_final

```

The output routine is also recursive, and it contains an adjustable indentation.

```

⟨Decays: decay root config: TBP⟩+≡
procedure :: write => decay_root_config_write
procedure :: write_header => decay_root_config_write_header
procedure :: write_terms => decay_root_config_write_terms

⟨Decays: procedures⟩+≡
recursive subroutine decay_root_config_write (object, unit, indent, verbose)

  logical, intent(in), optional :: verbose
  integer :: i, u, ind
  logical :: verb
  u = given_output_unit (unit)

```

```

ind = 0; if (present (indent)) ind = indent
verb = .true.; if (present (verbose)) verb = verbose
if (verb .and. allocated (object%term_config)) then
    do i = 1, size (object%term_config)
        call object%term_config(i)%write (u, ind + 1)
    end do
end if
end subroutine decay_root_config_write_terms

```

Initialize for a named process and (optionally) a pre-determined number of terms.

```

<Decays: decay root config: TBP>+≡
procedure :: init => decay_root_config_init
<Decays: procedures>+≡
subroutine decay_root_config_init (decay, model, process_id, n_terms)
    class(decay_root_config_t), intent(out) :: decay
    class(model_data_t), intent(in), target :: model
    type(string_t), intent(in) :: process_id
    integer, intent(in), optional :: n_terms
    decay%model => model
    decay%process_id = process_id
    if (present (n_terms)) then
        allocate (decay%term_config (n_terms))
    end if
end subroutine decay_root_config_init

```

Declare a decay term, given an array of flavors.

```

<Decays: decay root config: TBP>+≡
procedure :: init_term => decay_root_config_init_term
<Decays: procedures>+≡
recursive subroutine decay_root_config_init_term &
    (decay, i, flv, stable, model, process_stack)
    class(decay_root_config_t), intent(inout) :: decay
    integer, intent(in) :: i
    type(flvor_t), dimension(:, :), intent(in) :: flv
    logical, dimension(:, :), intent(in) :: stable
    class(model_data_t), intent(in), target :: model
    type(process_stack_t), intent(in), optional :: process_stack
    call decay%term_config(i)%init (flv, stable, model, process_stack)
end subroutine decay_root_config_init_term

```

Connect the decay root configuration with a process object (which should represent the parent process). This includes initialization, therefore intent(out).

The flavor state is retrieved from the process term object. However, we have to be careful: the flavor object points to the model instance that is stored in the process object. This model instance may not contain the current setting for unstable particles and decay. Therefore, we assign the model directly.

If the `process_instance` argument is provided, we use this for the flavor state. This applies to the decay root only, where the process can be entangled with a beam setup, and the latter contains beam remnants as further outgoing

particles. These must be included in the set of outgoing flavors, since the decay application is also done on the connected state.

Infer stability from the particle properties, using the first row in the set of flavor states. For unstable particles, we look for decays, recursively, available from the process stack (if present).

For the unstable particles, we have to check whether their masses match between the production and the decay. Fortunately, both versions are available for comparison.

```

<Decays: decay root config: TBP>+≡
procedure :: connect => decay_root_config_connect
<Decays: procedures>+≡
recursive subroutine decay_root_config_connect &
    (decay, process, model, process_stack, process_instance)

    end do
end subroutine decay_root_config_compute

```

### 30.4.6 Decay Root Instance

This is the common parent type for decay and decay root. The process instance points to the parent process. The model pointer is separate because particle settings may be updated w.r.t. the parent process object.

*(Decays: types)*+≡

```

type, abstract :: decay_gen_t
    private
    type(decay_term_t), dimension(:), allocatable :: term
    type(process_instance_t), pointer :: process_instance => null ()
    integer :: selected_mci = 0
    integer :: selected_term = 0
contains
    <i>(Decays: decay gen: TBP)</i>
end type decay_gen_t

```

The decay root represents the parent process. When an event is generated, the generator selects the term to which the decay chain applies (if possible).

The process instance is just a pointer.

*(Decays: public)*+≡

```

public :: decay_root_t

```

```

⟨Decays: types⟩+≡
    type, extends (decay_gen_t) :: decay_root_t
        private
        type(decay_root_config_t), pointer :: config => null ()
    contains
    ⟨Decays: decay root: TBP⟩
end type decay_root_t

```

The finalizer has to recursively finalize the terms, but we can skip the process instance which is not explicitly allocated.

```

⟨Decays: decay gen: TBP⟩≡
    procedure :: base_final => decay_gen_final
⟨Decays: procedures⟩+≡
    recursive subroutine decay_gen_final (object)
        class(decay_gen_t), intent(inout) :: object

    end function decay_gen_get_mci

    function decay_gen_get_term (decay) result (i)
        class(decay_gen_t), intent(inout) :: decay
        integer :: i
        i = decay%selected_term
    end function decay_gen_get_term

```

Implement random-number generators for unstable decay selection in all terms.  
This is not recursive.

We also make use of the fact that `process` is a pointer; the (state of the RNG factory inside the) target process will be modified by the rng-spawning method, but not the pointer.

```

⟨Decays: decay gen: TBP⟩+≡
    procedure :: make_term_rng => decay_gen_make_term_rng

⟨Decays: procedures⟩+≡

```

```

subroutine decay_gen_make_term_rng (decay, process)
    class(decay_gen_t), intent(inout) :: decay
    type(process_t), intent(in), pointer :: process
    integer :: i
    do i = 1, size (decay%term)
        call decay%term(i)%make_rng (process)
    end do
end subroutine decay_gen_make_term_rng

```

Recursively link interactions of the enclosed decay terms to the corresponding terms in the current process instance.

Note: A bug in nagfor requires the extra `i_term` variable.

```

⟨Decays: decay gen: TBP⟩+≡
    procedure :: link_term_interactions => decay_gen_link_term_interactions
⟨Decays: procedures⟩+≡
    recursive subroutine decay_gen_link_term_interactions (decay)
        class(decay_gen_t), intent(inout) :: decay
        integer :: i, i_term
        type(interaction_t), pointer :: trace
        associate (instance => decay%process_instance)
            do i = 1, size (decay%term)
                i_term = i
                trace => instance%get_trace_int_ptr (i_term)
                call decay%term(i_term)%link_interactions (trace)
            end do
        end associate
    end subroutine decay_gen_link_term_interactions

```

Select a decay chain: decay modes and process components.

```

⟨Decays: decay root: TBP⟩+≡
    procedure :: select_chain => decay_root_select_chain
⟨Decays: procedures⟩+≡
    subroutine decay_root_select_chain (decay_root)
        class(decay_root_t), intent(inout) :: decay_root
        if (decay_root%selected_term > 0) then
            call decay_root%term(decay_root%selected_term)%select_chain ()
        else
            call msg_bug ("Decays: no term selected for parent process")
        end if
    end subroutine decay_root_select_chain

```

Generate a decay tree, i.e., for the selected term in the parent process, recursively generate a decay event for all unstable particles.

Factor out the trace of the connected state of the parent process. This trace should not be taken into account for unweighting the decay chain, since it was already used for unweighting the parent event, or it determines the overall event weight.

```

⟨Decays: decay root: TBP⟩+≡
    procedure :: generate => decay_root_generate

```

```

⟨Decays: procedures⟩+≡
    subroutine decay_root_generate (decay_root)
        class(decay_root_t), intent(inout) :: decay_root
        type(connected_state_t), pointer :: connected_state
        if (decay_root%selected_term > 0) then
            connected_state => decay_root%process_instance%get_connected_state_ptr &
                (decay_root%selected_term)
            call connected_state%normalize_matrix_by_trace ()
            call decay_root%term(decay_root%selected_term)%generate ()
        else
            call msg_bug ("Decays: no term selected for parent process")
        end if
    end subroutine decay_root_generate

```

### 30.4.7 Decay Configuration

A decay configuration describes a distinct decay mode of a particle. Each decay mode may include several terms, which correspond to the terms in the associated process. In addition to the base type, the decay configuration object contains the integral of the parent process and the selector for the MCI group inside this process.

The flavor component should be identical to the flavor component of the parent particle (`unstable` object).

```

⟨Decays: types⟩+≡
    type, extends (decay_root_config_t) :: decay_config_t
        private
        type(flv_t) :: flv
        real(default) :: weight = 0
        real(default) :: integral = 0
        real(default) :: abs_error = 0
        real(default) :: rel_error = 0
        type(selector_t) :: mci_selector
        contains
            ⟨Decays: decay config: TBP⟩
    end type decay_config_t

```

The output routine extends the decay-root writer by listing numerical component values.

```

⟨Decays: decay config: TBP⟩≡
    procedure :: write => decay_config_write
⟨Decays: procedures⟩+≡
    recursive subroutine decay_config_write (object, unit, indent, verbose)
        class(decay_config_t), intent(in) :: object
        integer, intent(in), optional :: unit, indent
        logical, intent(in), optional :: verbose
        integer :: u, ind
        u = given_output_unit (unit)
        ind = 0; if (present (indent)) ind = indent
        call write_indent (u, ind)
        write (u, "(1x,A)") "Decay:"
        call object%write_header (unit, indent)

```

```

call write_indent (u, ind)
write (u, 2) "branching ratio =", object%weight * 100
call write_indent (u, ind)
write (u, 1) "partial width   =", object%integral
call write_indent (u, ind)
write (u, 1) "error (abs)     =", object%abs_error
call write_indent (u, ind)
write (u, 1) "error (rel)     =", object%rel_error
1 format (3x,A,ES19.12)
2 format (3x,A,F11.6,1x,'')
call object%write_terms (unit, indent, verbose)
end subroutine decay_config_write

```

Connect a decay configuration with a process object (which should represent the decay). This includes initialization, therefore intent(out). We first connect the process itself, then do initializations that are specific for this decay.

Infer stability from the particle properties, using the first row in the set of flavor states. Once we can deal with predetermined decay chains, they should be used instead.

```

⟨Decays: decay config: TBP⟩+≡
procedure :: connect => decay_config_connect
⟨Decays: procedures⟩+≡
recursive subroutine decay_config_connect &
  (decay, process, model, process_stack, process_instance)
  class(decay_config_t), intent(out) :: decay
  type(process_t), intent(in), target :: process
  class(model_data_t), intent(in), target :: model
  type(process_stack_t), intent(in), optional :: process_stack
  type(process_instance_t), intent(in), optional, target :: process_instance
  real(default), dimension(:), allocatable :: integral_mci
  integer :: i, n_mci
  call decay%decay_root_config_t%connect (process, model, process_stack)
  decay%integral = process%get_integral ()
  decay%abs_error = process%get_error ()
  if (process%cm_frame ()) then
    call msg_fatal ("Decay process " // char (process%get_id ()) &
                  // ": unusable because rest frame is fixed.")
  end if
  n_mci = process%get_n_mci ()
  allocate (integral_mci (n_mci))
  do i = 1, n_mci
    integral_mci(i) = process%get_integral_mci (i)
  end do
  call decay%mci_selector%init (integral_mci)
end subroutine decay_config_connect

```

Set the flavor entry, which repeats the flavor of the parent unstable particle.

```

⟨Decays: decay config: TBP⟩+≡
procedure :: set_flv => decay_config_set_flv
⟨Decays: procedures⟩+≡
subroutine decay_config_set_flv (decay, flv)

```

```

    class(decay_config_t), intent(inout) :: decay
    type(flavor_t), intent(in) :: flv
    decay%flv = flv
end subroutine decay_config_set_flv

```

Compute embedded branchings and the relative error. This method does not apply to the decay root.

```

⟨Decays: decay config: TBP⟩+≡
procedure :: compute => decay_config_compute
⟨Decays: procedures⟩+≡
recursive subroutine decay_config_compute (decay)
    class(decay_config_t), intent(inout) :: decay
    call decay%decay_root_config_t%compute ()
    if (.not. vanishes (decay%integral)) then
        decay%rel_error = decay%abs_error / decay%integral
    else
        decay%rel_error = 0
    end if
end subroutine decay_config_compute

```

### 30.4.8 Decay Instance

The decay contains a collection of terms. One of them is selected when the decay is evaluated. This is similar to the decay root, but we implement it independently.

The process instance object is allocated via a pointer, so it automatically behaves as a target.

```

⟨Decays: types⟩+≡
type, extends (decay_gen_t) :: decay_t
    private
    type(decay_config_t), pointer :: config => null ()
    class(rng_t), allocatable :: rng
contains
⟨Decays: decay: TBP⟩
end type decay_t

```

The finalizer is recursive.

```

⟨Decays: decay: TBP⟩≡
procedure :: final => decay_final
⟨Decays: procedures⟩+≡
recursive subroutine decay_final (object)
    class(decay_t), intent(inout) :: object
    integer :: i
    call object%base_final ()
    do i = 1, object%config%process%get_n_mci ()
        call object%process_instance%final_simulation (i)
    end do
    call object%process_instance%final ()
    deallocate (object%process_instance)
end subroutine decay_final

```

Output.

```
<Decays: decay: TBP>+≡
    procedure :: write => decay_write
<Decays: procedures>+≡
    recursive subroutine decay_write (object, unit, indent, recursive)
        class(decay_t), intent(in) :: object
        integer, intent(in), optional :: unit, indent, recursive
        integer :: u, ind
        u = given_output_unit (unit)
        ind = 0; if (present (indent)) ind = indent
        call object%config%write (unit, indent, verbose = .false.)
        if (allocated (object%rng)) then
            call object%rng%write (u, ind + 1)
        end if
        call write_indent (u, ind)
        if (object%selected_mci > 0) then
            write (u, "(3x,A,I0)") "Selected MCI      = ", object%selected_mci
        else
            write (u, "(3x,A)")   "Selected MCI      = [undefined]"
        end if
        call write_indent (u, ind)
        if (object%selected_term > 0) then
            write (u, "(3x,A,I0)") "Selected term     = ", object%selected_term
            call object%term(object%selected_term)%write (u, ind + 1)
        else
            write (u, "(3x,A)")   "Selected term     = [undefined]"
        end if
    end subroutine decay_write
```

Initializer. Base initialization is done recursively. Then, we prepare the current process instance and allocate a random-number generator for term selection. For all unstable particles, we also allocate a r.n.g. as spawned by the current process.

```
<Decays: decay: TBP>+≡
    procedure :: init => decay_init
<Decays: procedures>+≡
    recursive subroutine decay_init (decay, config)
        class(decay_t), intent(out) :: decay
        type(decay_config_t), intent(in), target :: config
        integer :: i
        call decay%base_init (config%term_config)
        decay%config => config
        allocate (decay%process_instance)
        call decay%process_instance%init (decay%config%process)
        call decay%process_instance%setup_event_data (decay%config%model)
        do i = 1, decay%config%process%get_n_mci ()
            call decay%process_instance%init_simulation (i)
        end do
        call decay%config%process%make_rng (decay%rng)
        call decay%make_term_rng (decay%config%process)
    end subroutine decay_init
```

Link interactions to the parent process. `i_prt` is the index of the current outgoing particle in the parent interaction, for which we take the trace evaluator. We link it to the beam particle in the beam interaction of the decay process instance. Then, repeat the procedure for the outgoing particles.

```
(Decays: decay: TBP) +≡
procedure :: link_interactions => decay_link_interactions
(Decays: procedures) +≡
recursive subroutine decay_link_interactions (decay, i_prt, trace)
  class(decay_t), intent(inout) :: decay
  integer, intent(in) :: i_prt
  type(interaction_t), intent(in), target :: trace
  type(interaction_t), pointer :: beam_int
  integer :: n_in, n_vir
  beam_int => decay%process_instance%get_beam_int_ptr ()
  n_in = trace%get_n_in ()
  n_vir = trace%get_n_vir ()
  call beam_int%set_source_link (1, trace, &
    n_in + n_vir + i_prt)
  call decay%link_term_interactions ()
end subroutine decay_link_interactions
```

Determine a decay chain. For each unstable particle we select one of the possible decay modes, and for each decay process we select one of the possible decay MCI components, calling the random-number generators. We do not generate momenta, yet.

```
(Decays: decay: TBP) +≡
procedure :: select_chain => decay_select_chain
(Decays: procedures) +≡
recursive subroutine decay_select_chain (decay)
  class(decay_t), intent(inout) :: decay
  real(default) :: x
  integer :: i
  call decay%rng%generate (x)
  decay%selected_mci = decay%config%mci_selector%select (x)
  call decay%process_instance%choose_mci (decay%selected_mci)
  call decay%process_instance%select_i_term (decay%selected_term)
  do i = 1, size (decay%term)
    call decay%term(i)%select_chain ()
  end do
end subroutine decay_select_chain
```

Generate a decay. We first receive the beam momenta from the parent process (assuming that this is properly linked), then call the associated process object for a new event.

Factor out the trace of the helicity density matrix of the isolated state (the one that will be used for the decay chain). The trace is taken into account for unweighting the individual decay event and should therefore be ignored for unweighting the correlated decay chain afterwards.

```
(Decays: decay: TBP) +≡
procedure :: generate => decay_generate
```

```

⟨Decays: procedures⟩+≡
recursive subroutine decay_generate (decay)
    class(decay_t), intent(inout) :: decay
    type(isolated_state_t), pointer :: isolated_state
    integer :: i
    call decay%process_instance%receive_beam_momenta ()
    call decay%config%process%generate_unweighted_event &
        (decay%process_instance, decay%selected_mci)
    if (signal_is_pending ()) return
    call decay%process_instance%evaluate_event_data ()
    isolated_state => &
        decay%process_instance%get_isolated_state_ptr (decay%selected_term)
    call isolated_state%normalize_matrix_by_trace ()
    do i = 1, size (decay%term)
        call decay%term(i)%generate ()
        if (signal_is_pending ()) return
    end do
end subroutine decay_generate

```

### 30.4.9 Stable Particles

This is a stable particle. The flavor can be ambiguous (e.g., partons).

```

⟨Decays: types⟩+≡
type, extends (any_config_t) :: stable_config_t
    private
    type(flavor_t), dimension(:), allocatable :: flv
contains
⟨Decays: stable config: TBP⟩
end type stable_config_t

```

The finalizer is empty:

```

⟨Decays: stable config: TBP⟩≡
procedure :: final => stable_config_final
⟨Decays: procedures⟩+≡
subroutine stable_config_final (object)
    class(stable_config_t), intent(inout) :: object
end subroutine stable_config_final

```

Output.

```

⟨Decays: stable config: TBP⟩+≡
procedure :: write => stable_config_write
⟨Decays: procedures⟩+≡
recursive subroutine stable_config_write (object, unit, indent, verbose)
    class(stable_config_t), intent(in) :: object
    integer, intent(in), optional :: unit, indent
    logical, intent(in), optional :: verbose
    integer :: u, i, ind
    u = given_output_unit (unit)
    ind = 0; if (present (indent)) ind = indent
    call write_indent (u, ind)

```

```

    write (u, "(1x,'+',1x,A)", advance = "no")  "Stable:"
    write (u, "(1x,A)", advance = "no")  char (object%flv(1)%get_name ())
    do i = 2, size (object%flv)
        write (u, ("(:',A)", advance = "no")) &
            char (object%flv(i)%get_name ())
    end do
    write (u, *)
end subroutine stable_config_write

```

Initializer. We are presented with an array of flavors, but there may be double entries which we remove, so we store only the distinct flavors.

```

⟨Decays: stable config: TBP⟩+≡
procedure :: init => stable_config_init
⟨Decays: procedures⟩+≡
subroutine stable_config_init (config, flv)
    class(stable_config_t), intent(out) :: config
    type(flavor_t), dimension(:, ), intent(in) :: flv
    integer, dimension (size (flv)) :: pdg
    logical, dimension (size (flv)) :: mask
    integer :: i
    pdg = flv%get_pdg ()
    mask(1) = .true.
    forall (i = 2 : size (pdg))
        mask(i) = all (pdg(i) /= pdg(1:i-1))
    end forall
    allocate (config%flv (count (mask)))
    config%flv = pack (flv, mask)
end subroutine stable_config_init

```

Here is the corresponding object instance. Except for the pointer to the configuration, there is no content.

```

⟨Decays: types⟩+≡
type, extends (any_t) :: stable_t
    private
    type(stable_config_t), pointer :: config => null ()
contains
    ⟨Decays: stable: TBP⟩
end type stable_t

```

The finalizer does nothing.

```

⟨Decays: stable: TBP⟩≡
procedure :: final => stable_final
⟨Decays: procedures⟩+≡
subroutine stable_final (object)
    class(stable_t), intent(inout) :: object
end subroutine stable_final

```

We can delegate output to the configuration object.

```

⟨Decays: stable: TBP⟩+≡
procedure :: write => stable_write

```

```

⟨Decays: procedures⟩+≡
    subroutine stable_write (object, unit, indent)
        class(stable_t), intent(in) :: object
        integer, intent(in), optional :: unit, indent
        call object%config%write (unit, indent)
    end subroutine stable_write

```

Initializer: just assign the configuration.

```

⟨Decays: stable: TBP⟩+≡
    procedure :: init => stable_init
⟨Decays: procedures⟩+≡
    subroutine stable_init (stable, config)
        class(stable_t), intent(out) :: stable
        type(stable_config_t), intent(in), target :: config
        stable%config => config
    end subroutine stable_init

```

### 30.4.10 Unstable Particles

A branching configuration enables us to select among distinct decay modes of a particle. We store the particle flavor (with its implicit link to a model), an array of decay configurations, and a selector object.

The total width, absolute and relative error are stored as `integral`, `abs_error`, and `rel_error`, respectively.

The flavor must be unique in this case.

```

⟨Decays: public⟩+≡
    public :: unstable_config_t
⟨Decays: types⟩+≡
    type, extends (any_config_t) :: unstable_config_t
        private
        type(flavor_t) :: flv
        real(default) :: integral = 0
        real(default) :: abs_error = 0
        real(default) :: rel_error = 0
        type(selector_t) :: selector
        type(decay_config_t), dimension(:), allocatable :: decay_config
contains
⟨Decays: unstable config: TBP⟩
end type unstable_config_t

```

Finalizer. The branching configuration can be a recursive structure.

```

⟨Decays: unstable config: TBP⟩≡
    procedure :: final => unstable_config_final
⟨Decays: procedures⟩+≡
    recursive subroutine unstable_config_final (object)
        class(unstable_config_t), intent(inout) :: object
        integer :: i
        if (allocated (object%decay_config)) then
            do i = 1, size (object%decay_config)

```

```

        call object%decay_config(i)%final ()
    end do
end if
end subroutine unstable_config_final

```

Output. Since this may be recursive, we include indentation.

```

<Decays: unstable config: TBP>+≡
procedure :: write => unstable_config_write
<Decays: procedures>+≡
recursive subroutine unstable_config_write (object, unit, indent, verbose)
class(unstable_config_t), intent(in) :: object
integer, intent(in), optional :: unit, indent
logical, intent(in), optional :: verbose
integer :: u, i, ind
logical :: verb
u = given_output_unit (unit)
ind = 0; if (present (indent)) ind = indent
verb = .true.; if (present (verbose)) verb = verbose
call write_indent (u, ind)
write (u, "(1x,'+',1x,A,1x,A)") "Unstable:", &
     char (object%flv%get_name ())
call write_indent (u, ind)
write (u, 1) "total width =", object%integral
call write_indent (u, ind)
write (u, 1) "error (abs) =", object%abs_error
call write_indent (u, ind)
write (u, 1) "error (rel) =", object%rel_error
1 format (5x,A,ES19.12)
if (verb .and. allocated (object%decay_config)) then
    do i = 1, size (object%decay_config)
        call object%decay_config(i)%write (u, ind + 1)
    end do
end if
end subroutine unstable_config_write

```

Initializer. For the unstable particle, the flavor is unique.

```

<Decays: unstable config: TBP>+≡
procedure :: init => unstable_config_init
<Decays: procedures>+≡
subroutine unstable_config_init (unstable, flv, set_decays, model)
class(unstable_config_t), intent(out) :: unstable
type(flvor_t), intent(in) :: flv
logical, intent(in), optional :: set_decays
class(model_data_t), intent(in), optional, target :: model
type(string_t), dimension(:), allocatable :: decay
unstable%flv = flv
if (present (set_decays)) then
    call unstable%flv%get_decays (decay)
    call unstable%init_decays (decay, model)
end if
end subroutine unstable_config_init

```

Further initialization: determine the number of decay modes. We can assume that the flavor of the particle has been set already.

If the process stack is given, we can delve recursively into actually assigning decay processes. Otherwise, we just initialize with decay process names.

```
<Decays: unstable config: TBP>+≡
procedure :: init_decays => unstable_config_init_decays
<Decays: procedures>+≡
recursive subroutine unstable_config_init_decays &
    (unstable, decay_id, model, process_stack)
    class(unstable_config_t), intent(inout) :: unstable
    type(string_t), dimension(:), intent(in) :: decay_id
    class(model_data_t), intent(in), target :: model
    type(process_stack_t), intent(in), optional :: process_stack
    integer :: i
    allocate (unstable%decay_config (size (decay_id)))
    do i = 1, size (decay_id)
        associate (decay => unstable%decay_config(i))
        if (present (process_stack)) then
            call decay%connect (process_stack%get_process_ptr (decay_id(i)), &
                model, process_stack)
        else
            call decay%init (model, decay_id(i))
        end if
        call decay%set_flv (unstable%flv)
        end associate
    end do
end subroutine unstable_config_init_decays
```

Explicitly connect a specific decay with a process. This is used only in unit tests.

```
<Decays: unstable config: TBP>+≡
procedure :: connect_decay => unstable_config_connect_decay
<Decays: procedures>+≡
subroutine unstable_config_connect_decay (unstable, i, process, model)

```

### 30.4.11 Decay Chain

While the decay configuration tree and the decay tree are static entities (during a simulation run), the decay chain is dynamically generated for each event. The reason is that with the possibility of several decay modes for each particle, and

several terms for each process, the total number of distinct decay chains is not under control.

Each entry in the decay chain is a connected parton state. The origin of the chain is a connected state in the parent process (not part of the chain itself). For each decay, mode and term chosen, we convolute this with the isolated (!) state of the current decay, to generate a new connected state. We accumulate this chain by recursively traversing the allocated decay tree. Whenever a particle decays, it becomes virtual and is replaced by its decay product, while all other particles stay in the parton state as spectators.

Technically, we implement the decay chain as a stack structure and include information from the associated decay object for easier debugging. This is a decay chain entry:

```
<Decays: types>+≡
    type, extends (connected_state_t) :: decay_chain_entry_t
        private
        integer :: index = 0
        type(decay_config_t), pointer :: config => null ()
        integer :: selected_mci = 0
        integer :: selected_term = 0
        type(decay_chain_entry_t), pointer :: previous => null ()
    end type decay_chain_entry_t
```

This is the complete chain; we need just a pointer to the last entry. We also include a pointer to the master process instance, which serves as the seed for the decay chain.

The evaluator `correlated_trace` traces over all quantum numbers for the final spin-correlated (but color-summed) evaluator of the decay chain. This allows us to compute the probability for a momentum configuration, given that all individual density matrices (of the initial process and the subsequent decays) have been normalized to one.

Note: This trace is summed over color, so color is treated exactly when computing spin correlations. However, we do not keep non-diagonal color correlations. When an event is accepted, we compute probabilities for all color states and can choose one of them.

```
<Decays: public>+≡
    public :: decay_chain_t

<Decays: types>+≡
    type :: decay_chain_t
        private
        type(process_instance_t), pointer :: process_instance => null ()
        integer :: selected_term = 0
        type(evaluator_t) :: correlated_trace
        type(decay_chain_entry_t), pointer :: last => null ()
    contains
        <Decays: decay chain: TBP>
    end type decay_chain_t
```

The finalizer recursively deletes and deallocates the entries.

```
<Decays: decay chain: TBP>≡
    procedure :: final => decay_chain_final
```

```

⟨Decays: procedures⟩+≡
    subroutine decay_chain_final (object)
        class(decay_chain_t), intent(inout) :: object
        type(decay_chain_entry_t), pointer :: entry
        do while (associated (object%last))
            entry => object%last
            object%last => entry%previous
            call entry%final ()
            deallocate (entry)
        end do
        call object%correlated_trace%final ()
    end subroutine decay_chain_final

```

Doing output recursively allows us to display the chain in chronological order.

```

⟨Decays: decay chain: TBP⟩+≡
    procedure :: write => decay_chain_write
⟨Decays: procedures⟩+≡
    subroutine decay_chain_write (object, unit)
        class(decay_chain_t), intent(in) :: object
        integer, intent(in), optional :: unit

call chain%correlated_trace%init_qn_sum (int_last_decay, qn_mask)
end subroutine decay_chain_build

```

Build the entries that correspond to a decay term. We have to scan all unstable particles.

```

⟨Decays: decay chain: TBP⟩+≡
procedure :: build_term_entries => decay_chain_build_term_entries

⟨Decays: procedures⟩+≡
recursive subroutine decay_chain_build_term_entries (chain, term)
    class(decay_chain_t), intent(inout) :: chain
    type(decay_term_t), intent(in) :: term
    integer :: i
    do i = 1, size (term%particle_out)
        select type (unstable => term%particle_out(i)%c)
        type is (unstable_t)
            if (unstable%selected_decay > 0) then
                call chain%build_decay_entries &
                    (unstable%decay(unstable%selected_decay))
            end if
        end select
    end do
end subroutine decay_chain_build_term_entries

```

Build the entries that correspond to a specific decay. The decay term should have been determined, so we allocate a decay chain entry and fill it, then proceed to child decays.

For the first entry, we convolute the connected state of the parent process instance with the isolated state of the current decay (which does not contain an extra beam entry for the parent). For subsequent entries, we take the previous entry as first factor.

In principle, each chain entry (as a parton state) is capable of holding a subevent object and associated expressions. We currently do not make use of that feature.

Before generating the decays, factor out the trace of the helicity density matrix of the parent parton state. This trace has been used for unweighting the original event (unweighted case) or it determines the overall weight, so it should not be taken into account in the decay chain generation.

```

⟨Decays: decay chain: TBP⟩+≡

```

```

procedure :: build_decay_entries => decay_chain_build_decay_entries
(Decays: procedures)+≡
  recursive subroutine decay_chain_build_decay_entries (chain, decay)
    class(decay_chain_t), intent(inout) :: chain

    end if
    chain%last => entry
    call chain%build_term_entries (decay%term(decay%selected_term))
  end subroutine decay_chain_build_decay_entries

```

Recursively fill the decay chain with momenta and evaluate the matrix elements. Since all evaluators should have correct source entries at this point, momenta are automatically retrieved from the appropriate process instance.

Like we did above for the parent process, factor out the trace for each subsequent decay (the helicity density matrix in the isolated state, which is taken

for the convolution).

```

⟨Decays: decay chain: TBP⟩+≡
    procedure :: evaluate => decay_chain_evaluate
⟨Decays: procedures⟩+≡
    subroutine decay_chain_evaluate (chain)
        class(decay_chain_t), intent(inout) :: chain
        call evaluate (chain%last)
        call chain%correlated_trace%receive_momenta ()
        call chain%correlated_trace%evaluate ()
    contains
        recursive subroutine evaluate (entry)
            type(decay_chain_entry_t), intent(inout), pointer :: entry
            if (associated (entry)) then
                call evaluate (entry%previous)
                call entry%receive_kinematics ()
                call entry%evaluate_trace ()
                call entry%evaluate_event_data ()
            end if
            end subroutine evaluate
    end subroutine decay_chain_evaluate

```

Return the probability of a decay chain. This is given as the trace of the density matrix with intermediate helicity correlations, normalized by the product of the uncorrelated density matrix traces. This works only if an event has been evaluated and the `correlated_trace` evaluator is filled. By definition, this evaluator has only one matrix element, and this must be real.

```

⟨Decays: decay chain: TBP⟩+≡
    procedure :: get_probability => decay_chain_get_probability
⟨Decays: procedures⟩+≡
    function decay_chain_get_probability (chain) result (x)
        class(decay_chain_t), intent(in) :: chain
        real(default) :: x
        x = real (chain%correlated_trace%get_matrix_element (1))
    end function decay_chain_get_probability

```

### 30.4.12 Decay as Event Transform

The `evt_decay` object combines decay configuration, decay tree, and chain in a single object, as an implementation of the `evt` (event transform) abstract type.

```

⟨Decays: public⟩+≡
    public :: evt_decay_t
⟨Decays: types⟩+≡
    type, extends (evt_t) :: evt_decay_t
        private
        type(decay_root_config_t) :: decay_root_config
        type(decay_root_t) :: decay_root
        type(decay_chain_t) :: decay_chain
    contains
⟨Decays: evt decay: TBP⟩

```

```
end type evt_decay_t
```

Output. We display the currently selected decay tree, which includes configuration data, and the decay chain, i.e., the evaluators.

```
<Decays: evt decay: TBP>≡
procedure :: write => evt_decay_write
<Decays: procedures>+≡
subroutine evt_decay_write (evt, unit, verbose, more_verbose, testflag)
  class(evt_decay_t), intent(in) :: evt
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: verbose, more_verbose, testflag
  logical :: verb, verb2
  integer :: u
  u = given_output_unit (unit)
  verb = .true.; if (present (verbose)) verb = verbose
  verb2 = .false.; if (present (more_verbose)) verb2 = more_verbose
  call write_separator (u, 2)
  write (u, "(1x,A)") "Event transform: partonic decays"
  call write_separator (u, 2)
  call evt%base_write (u, testflag = testflag)
  if (verb) then
    call write_separator (u)
    call evt%decay_root%write (u)
    if (verb2) then
      call evt%decay_chain%write (u)
      call evt%decay_root%write_process_instances (u, verb)
    end if
  else
    call write_separator (u, 2)
  end if
end subroutine evt_decay_write
```

Connect with a process instance and process. This initializes the decay configuration. The process stack is used to look for process objects that implement daughter decays.

When all processes are assigned, configure the decay tree instance, using the decay tree configuration. First obtain the branching ratios, then allocate the decay tree. This is done once for all events.

```
<Decays: evt decay: TBP>+≡
procedure :: connect => evt_decay_connect
<Decays: procedures>+≡
subroutine evt_decay_connect (evt, process_instance, model, process_stack)
  class(evt_decay_t), intent(inout), target :: evt
  type(process_instance_t), intent(in), target :: process_instance
  class(model_data_t), intent(in), target :: model
  type(process_stack_t), intent(in), optional :: process_stack
  call evt%base_connect (process_instance, model)
  call evt%decay_root_config%connect (process_instance%process, &
    model, process_stack, process_instance)
  call evt%decay_root_config%compute ()
  call evt%decay_root%init (evt%decay_root_config, evt%process_instance)
```

```
end subroutine evt_decay_connect
```

Prepare a new event: Select a decay chain and build the corresponding chain object.

```
(Decays: evt decay: TBP)+≡
procedure :: prepare_new_event => evt_decay_prepare_new_event
(Decays: procedures)+≡
subroutine evt_decay_prepare_new_event (evt, i_mci, i_term)
  class(evt_decay_t), intent(inout) :: evt
  integer, intent(in) :: i_mci, i_term
  call evt%reset ()
  evt%decay_root%selected_mci = i_mci
  evt%decay_root%selected_term = i_term
  call evt%decay_root%select_chain ()
  call evt%decay_chain%build (evt%decay_root)
end subroutine evt_decay_prepare_new_event
```

Generate a weighted event and assign the resulting weight (probability). We use a chain initialized by the preceding subroutine, fill it with momenta and evaluate.

```
(Decays: evt decay: TBP)+≡
procedure :: generate_weighted => evt_decay_generate_weighted
(Decays: procedures)+≡
subroutine evt_decay_generate_weighted (evt, probability)
  class(evt_decay_t), intent(inout) :: evt
  real(default), intent(inout) :: probability
  call evt%decay_root%generate ()
  if (signal_is_pending ()) return
  call evt%decay_chain%evaluate ()
  probability = evt%decay_chain%get_probability ()
end subroutine evt_decay_generate_weighted
```

To create a usable event, we have to transform the interaction into a particle set; this requires factorization for the correlated density matrix, according to the factorization mode.

```
(Decays: evt decay: TBP)+≡
procedure :: make_particle_set => evt_decay_make_particle_set
(Decays: procedures)+≡
subroutine evt_decay_make_particle_set &
  (evt, factorization_mode, keep_correlations, r)
  class(evt_decay_t), intent(inout) :: evt
  integer, intent(in) :: factorization_mode
  logical, intent(in) :: keep_correlations
  real(default), dimension(:, ), intent(in), optional :: r
  type(interaction_t), pointer :: int_matrix, int_flows
  type(decay_chain_entry_t), pointer :: last_entry
  last_entry => evt%decay_chain%last
  int_matrix => last_entry%get_matrix_int_ptr ()
  int_flows  => last_entry%get_flows_int_ptr ()
  call evt%factorize_interactions (int_matrix, int_flows, &
```

```

        factorization_mode, keep_correlations, r)
call evt%tag_incoming ()
end subroutine evt_decay_make_particle_set

```

```

### 30.5.1 Configuration Parameters

POWHEG\_TESTING allows to disable the parton shower for validation and testing of the POWHEG procedure.

```
(Shower: parameters)≡  
    logical, parameter :: POWHEG_TESTING = .false.
```

### 30.5.2 Event Transform

The event transforms can do more than mere showering. Especially, it may reweight showered events to fixed-order matrix elements. The `model_hadrons` is supposed to be the SM variant that contains all hadrons that can be generated in the shower.

```
(Shower: public)≡  
    public :: evt_shower_t  
  
(Shower: types)≡  
    type, extends (evt_t) :: evt_shower_t  
        class(shower_base_t), allocatable :: shower  
        class(matching_t), allocatable :: matching  
        type(model_t), pointer :: model_hadrons => null()  
        type(qcd_t), pointer :: qcd => null()  
        type(pdf_data_t) :: pdf_data  
        type(os_data_t) :: os_data  
        logical :: is_first_event  
    contains  
        (Shower: evt shower: TBP)  
    end type evt_shower_t
```

Output.

```
(Shower: evt shower: TBP)≡  
    procedure :: write => evt_shower_write

    end subroutine evt_shower_first_event

```

Here we take the particle set from the previous event transform (assuming that there is always one) and apply the shower algorithm. The result is stored in

the event transform of the current object. We always return a probability of unity as we don't have the analytic weight of the combination of shower, MLM matching and hadronization. A subdivision into multiple event transformations is under construction. Invalid or vetoed events have to be discarded by the caller which is why we mark the particle set as invalid. This procedure directly takes the (MLM) matching into account.

```

## 30.6 Fixed Order NLO Events

This section deals with the generation of weighted event samples which take into account next-to-leading order corrections. An approach generating unweighted events is not possible here, because negative weights might occur due to subtraction. Note that the events produced this way are not physical in the sense that they will not keep NLO-accuracy when interfaced to a parton shower. They are rather useful for theoretical consistency checks and a fast estimate of NLO effects.

We generate NLO events in the following way: First, the integration is carried out using the complete divergence-subtracted NLO matrix element. In the subsequent simulation,  $N$ -particle kinematics are generated using  $\mathcal{B} + \mathcal{V} + \mathcal{C}$  as weight. After that, the program loops over all singular regions and for each of them generates an event with  $N + 1$ -particle kinematics. The weight for those events corresponds to the real matrix element  $\mathcal{R}^\alpha$  evaluated at the  $\alpha$ -region's emitter's phase space point, multiplied with  $S_\alpha$ . This procedure is implemented using the `evt_nlo` transform.

`(evt_nlo.f90)≡`

```

This event transformation is for the generation of fixed-order NLO events. It takes an event with Born kinematics and creates  $N_\alpha + 1$  modified weighted events. The first one has Born kinematics and its weight is the sum of Born, Real and subtraction matrix elements. The other  $N_\alpha$  events have a weight which is equal to the real matrix element, evaluated with the phase space corresponding to the emitter of the  $\alpha$ -region. All NLO event objects share the same event transformation. For this reason, we save the particle set of the current  $\alpha$ -region in the array `particle_set_radiated`. Otherwise it would be unretrievable if the usual particle set of the event object was used. @

        call evt%base_connect (process_instance, model, process_stack)
        associate (generator => evt%phs_fks_generator, &
                   nlo_controller => process_instance%nlo_controller)
            sqrts = process_instance%get_sqrts ()
            call nlo_controller%setup_generator (generator, sqrts)
        end associate
    end subroutine evt_nlo_connect

<Evt Nlo: evt nlo: TBP>+≡
    procedure :: prepare_new_event => evt_nlo_prepare_new_event
<Evt Nlo: procedures>+≡
    subroutine evt_nlo_prepare_new_event (evt, i_mci, i_term)
        class(evt_nlo_t), intent(inout) :: evt
        integer, intent(in) :: i_mci, i_term
    end subroutine evt_nlo_prepare_new_event

The event transform has a variable which counts the number of times it has
already been called for one generation point. If i_evaluation is zero, this means
that evt_nlo_generate is called for the first time, so that the generation of an
 $N$ -particle event is required. In all other cases, emission events are generated.
Note that for the first event, the computed weights are added to probability,
which at this point is equal to  $\mathcal{B} + \mathcal{V}$ , whereas for all other runs probability is
replaced. To keep  $\langle \sum w_i \rangle = N \times \sigma$  as it is for weighted LO events, we have
to multiply by  $N_{\alpha_r} + 1$  since the cross section is distributed over the real and
Born subevents.

### 30.7.1 Event configuration

The parameters govern the transformation of an event to a particle set.

The **safety\_factor** reduces the acceptance probability for unweighting. If greater than one, excess events become less likely, but the reweighting efficiency also drops.

The **sigma** and **n** values, if nontrivial, allow for reweighting the events according to the requested **norm\_mode**.

Various **parse\_node\_t** objects are taken from the SINDARIN input. They encode expressions that apply to the current event. The workspaces for evaluating those expressions are set up in the **event\_expr\_t** objects. Note that these are really pointers, so the actual nodes are not stored inside the event object.

*⟨Events: types⟩≡*

```

### 30.7.2 The event type

This is the concrete implementation of the `generic_event_t` core that is defined above in the `event_base` module. The core manages the main (dressed) particle set pointer and the current values for weights and sqme. The implementation adds configuration data, expressions, process references, and event transforms.

Each event refers to a single elementary process. This process may be dressed by a shower, a decay chain etc. We maintain pointers to a process instance.

A list of event transforms (class `evt_t`) transform the connected interactions of the process instance into the final particle set. In this list, the first transform is always the trivial one, which just factorizes the process instance. Subsequent transforms may apply decays, etc. The `particle_set` pointer identifies the particle set that we want to be analyzed and returned by the event, usually the last one.

Squared matrix element and weight values: when reading events from file, the `ref` value is the number in the file, while the `prc` value is the number that we calculate from the momenta in the file, possibly with different parameters. When generating events the first time, or if we do not recalculate, the numbers should coincide. Furthermore, the array of `alt` values is copied from an array of alternative event records. These values should represent calculated values.

The `sqme` and `weight` values mirror corresponding values in the `expr` subobject. The idea is that when generating or reading events, the event record is filled first, then the `expr` object acquires copies. These copies are used for writing events and as targets for pointer variables in the analysis expression.

All data that involve user-provided expressions (selection, reweighting, analysis) are handled by the `expr` subobject. In particular, evaluating the event-selection expression sets the `passed` flag. Furthermore, the `expr` subobject collects data that can be used in the analysis and should be written to file, including copies of `sqme` and `weight`.

```

<Events: public>≡
public :: event_t

<Events: types>+≡
type, extends (generic_event_t) :: event_t
    type(event_config_t) :: config
    type(process_t), pointer :: process => null ()
    type(process_instance_t), pointer :: instance => null ()
    class(rng_t), allocatable :: rng
    integer :: selected_i_mci = 0
    integer :: selected_i_term = 0
    integer :: selected_channel = 0
    logical :: is_complete = .false.
    class(evt_t), pointer :: transform_first => null ()
    class(evt_t), pointer :: transform_last => null ()
    type(event_expr_t) :: expr

```

```

logical :: selection_evaluated = .false.
logical :: passed = .false.
real(default), allocatable :: alpha_qcd_forced
real(default), allocatable :: scale_forced
real(default) :: reweight = 1
logical :: analysis_flag = .false.
integer :: i_event = 0
contains
<Events: event: TBP>
end type event_t

```

Finalizer: the list of event transforms is deleted iteratively.

```

<Events: event: TBP>≡
procedure :: final => event_final
<Events: procedures>+≡
subroutine event_final (object)
  class(event_t), intent(inout) :: object
  class(evt_t), pointer :: evt
  if (allocated (object%rng))  call object%rng%final ()
  call object%expr%final ()
  do while (associated (object%transform_first))
    evt => object%transform_first
    object%transform_first => evt%next
    call evt%final ()
    deallocate (evt)
  end do
end subroutine event_final

```

Output.

Particle set: this is a pointer to one of the event transforms, so it should suffice to print the latter.

```

```

### 30.7.3 Initialization

Initialize: set configuration parameters, using a variable list. We do not call this `init`, because this method name will be used by a type extension.

The default normalization is `NORM_SIGMA`, since the default generation mode is weighted.

For unweighted events, we may want to apply a safety factor to event rejection. (By default, this factor is unity and can be ignored.)

We also allocate the trivial event transform, which is always the first one.

```

⟨Events: event: TBP⟩+≡
procedure :: basic_init => event_init
⟨Events: procedures⟩+≡
subroutine event_init (event, var_list, n_alt)
    class(event_t), intent(out) :: event
    type(var_list_t), intent(in), optional :: var_list
    integer, intent(in), optional :: n_alt
    type(string_t) :: norm_string
    logical :: polarized_events
    if (present (n_alt)) then
        call event%base_init (n_alt)
        call event%expr%init (n_alt)
    else
        call event%base_init (0)
    end if

```

```

if (present (var_list)) then
    event%config%unweighted = var_list%get_lval (&
        var_str ("?unweighted"))
    norm_string = var_list%get_sval (&
        var_str ("$sample_normalization"))
    event%config%norm_mode = &
        event_normalization_mode (norm_string, event%config%unweighted)
    polarized_events = &
        var_list%get_lval (var_str ("?polarized_events"))
    if (polarized_events) then
        event%config%factorization_mode = FM_SELECT_HELCITY
    else
        event%config%factorization_mode = FM_IGNORE_HELCITY
    end if
    if (event%config%unweighted) then
        event%config%safety_factor = var_list%get_rval (&
            var_str ("safety_factor"))
    end if
else
    event%config%norm_mode = NORM_SIGMA
end if
allocate (evt_trivial_t :: event%transform_first)
event%transform_last => event%transform_first
end subroutine event_init

```

Set the `sigma` and `n` values in the configuration record that determine non-standard event normalizations. If these numbers are not set explicitly, the default value for both is unity, and event renormalization has no effect.

```

⟨Events: event: TBP⟩+≡
procedure :: set_sigma => event_set_sigma
procedure :: set_n => event_set_n

⟨Events: procedures⟩+≡
elemental subroutine event_set_sigma (event, sigma)
    class(event_t), intent(inout) :: event
    real(default), intent(in) :: sigma
    event%config%sigma = sigma
end subroutine event_set_sigma

elemental subroutine event_set_n (event, n)
    class(event_t), intent(inout) :: event
    integer, intent(in) :: n
    event%config%n = n
end subroutine event_set_n

```

Append an event transform (decays, etc.). The transform is not yet connected to a process. The transform is then considered to belong to the event object, and will be finalized together with it. The original pointer is removed.

We can assume that the trivial transform is already present in the event object, at least.

```

⟨Events: event: TBP⟩+≡
procedure :: import_transform => event_import_transform

```

```

⟨Events: procedures⟩+≡
    subroutine event_import_transform (event, evt)
        class(event_t), intent(inout) :: event
        class(evt_t), intent(inout), pointer :: evt
        event%transform_last%next => evt
        evt%previous => event%transform_last
        event%transform_last => evt
        evt => null ()
    end subroutine event_import_transform

```

We link the event to an existing process instance. This includes the variable list, which is linked to the process variable list. Note that this is not necessarily identical to the variable list used for event initialization.

The variable list will contain pointers to `event` subobjects, therefore the `target` attribute.

Once we have a process connected, we can use it to obtain an event generator instance.

The model and process stack may be needed by event transforms. The current model setting may be different from the model in the process (regarding unstable particles, etc.). The process stack can be used for assigning extra processes that we need for the event transforms.

```

⟨Events: event: TBP⟩+≡
    procedure :: connect => event_connect
⟨Events: procedures⟩+≡
    subroutine event_connect (event, process_instance, model, process_stack)
        class(event_t), intent(inout), target :: event
        type(process_instance_t), intent(in), target :: process_instance
        class(model_data_t), intent(in), target :: model
        type(process_stack_t), intent(in), optional :: process_stack
        type(string_t) :: id
        integer :: num_id
        class(evt_t), pointer :: evt
        event%process => process_instance%process
        event%instance => process_instance
        id = event%process%get_id ()
        if (id /= "") call event%expr%set_process_id (id)
        num_id = event%process%get_num_id ()
        if (num_id /= 0) call event%expr%set_process_num_id (num_id)
        call event%expr%setup_vars (event%process%get_sqrt ())
        call event%expr%link_var_list (event%process%get_var_list_ptr ())
        call event%process%make_rng (event%rng)
        evt => event%transform_first
        do while (associated (evt))
            call evt%connect (process_instance, model, process_stack)
            evt => evt%next
        end do
    end subroutine event_connect

```

Set the parse nodes for the associated expressions, individually. The parse-node pointers may be null.

```

⟨Events: event: TBP⟩+≡

```

```

procedure :: set_selection => event_set_selection
procedure :: set_reweight => event_set_reweight
procedure :: set_analysis => event_set_analysis

⟨Events: procedures⟩+≡
    subroutine event_set_selection (event, ef_selection)
        class(event_t), intent(inout) :: event
        class(expr_factory_t), intent(in) :: ef_selection
        allocate (event%config%ef_selection, source = ef_selection)
    end subroutine event_set_selection

    subroutine event_set_reweight (event, ef_reweight)
        class(event_t), intent(inout) :: event
        class(expr_factory_t), intent(in) :: ef_reweight
        allocate (event%config%ef_reweight, source = ef_reweight)
    end subroutine event_set_reweight

    subroutine event_set_analysis (event, ef_analysis)
        class(event_t), intent(inout) :: event
        class(expr_factory_t), intent(in) :: ef_analysis
        allocate (event%config%ef_analysis, source = ef_analysis)
    end subroutine event_set_analysis

```

Create evaluation trees from the parse trees. The `target` attribute is required because the expressions contain pointers to event subobjects.

```

⟨Events: event: TBP⟩+≡
    procedure :: setup_expressions => event_setup_expressions

⟨Events: procedures⟩+≡
    subroutine event_setup_expressions (event)
        class(event_t), intent(inout), target :: event
        call event%expr%setup_selection (event%config%ef_selection)
        call event%expr%setup_analysis (event%config%ef_analysis)
        call event%expr%setup_reweight (event%config%ef_reweight)
    end subroutine event_setup_expressions

```

### 30.7.4 Evaluation

To fill the `particle_set`, i.e., the event record proper, we have to apply all event transforms in order. The last transform should fill its associated particle set, factorizing the state matrix according to the current settings. There are several parameters in the event configuration that control this.

We always fill the particle set for the first transform (the hard process) and the last transform, if different from the first (the fully dressed process).

Each event transform is an event generator of its own. We choose to generate an *unweighted* event for each of them, even if the master event is assumed to be weighted. Thus, the overall event weight is the one of the hard process only. (There may be more options in future extensions.)

We can generate the two random numbers that the factorization needs. For testing purpose, we allow for providing them explicitly, as an option.

```

⟨Events: event: TBP⟩+≡
    procedure :: evaluate_transforms => event_evaluate_transforms

```

```

<Events: procedures>+≡
subroutine event_evaluate_transforms (event, r)
    class(event_t), intent(inout) :: event

        call msg_debug (D_TRANSFORMS, "event%weight_prc", event%weight_prc)
        call msg_debug (D_TRANSFORMS, "event%sqme_prc", event%sqme_prc)

```

```

    end if
end subroutine event_evaluate_transforms
```

Evaluate the event-related expressions, given a valid `particle_set`. If `update_sqme` is set, we use the process instance for the `sqme_prc` value. The `sqme_ref` value is always taken from the event record.

Note: without the explicit `particle_set` pointer, some gfortran 4.8 version corrupts its memory.

```

⟨Events: event: TBP⟩+≡
procedure :: evaluate_expressions => event_evaluate_expressions
⟨Events: procedures⟩+≡
subroutine event_evaluate_expressions (event)
  class(event_t), intent(inout) :: event
  type(particle_set_t), pointer :: particle_set
  if (event%has_valid_particle_set ()) then
    particle_set => event%get_particle_set_ptr ()
    call event%expr%fill_subevt (particle_set)
  end if
  if (event%weight_ref_is_known ()) then
    call event%expr%set (weight_ref = event%get_weight_ref ())
  end if
  if (event%weight_prc_is_known ()) then
    call event%expr%set (weight_prc = event%get_weight_prc ())
  end if
  if (event%excess_prc_is_known ()) then
    call event%expr%set (excess_prc = event%get_excess_prc ())
  end if
  if (event%sqme_ref_is_known ()) then
    call event%expr%set (sqme_ref = event%get_sqme_ref ())
  end if
  if (event%sqme_prc_is_known ()) then
    call event%expr%set (sqme_prc = event%get_sqme_prc ())
  end if
  if (event%has_valid_particle_set ()) then
    call event%expr%evaluate &
      (event%passed, event%reweight, event%analysis_flag)
    event%selection_evaluated = .true.
  end if
end subroutine event_evaluate_expressions
```

Report the result of the `selection` evaluation.

```

⟨Events: event: TBP⟩+≡
procedure :: passed_selection => event_passed_selection
⟨Events: procedures⟩+≡
function event_passed_selection (event) result (flag)
  class(event_t), intent(in) :: event
  logical :: flag
  flag = event%passed
end function event_passed_selection
```

Set alternate sqme and weight arrays. This should be merged with the previous routine, if the expressions are allowed to refer to these values.

```
<Events: event: TBP>+≡
procedure :: store_alt_values => event_store_alt_values
<Events: procedures>+≡
subroutine event_store_alt_values (event)
  class(event_t), intent(inout) :: event
  if (event%weight_alt_is_known ()) then
    call event%expr%set (weight_alt = event%get_weight_alt ())
  end if
  if (event%sqme_alt_is_known ()) then
    call event%expr%set (sqme_alt = event%get_sqme_alt ())
  end if
end subroutine event_store_alt_values
```

### 30.7.5 Reset to empty state

Applying this, current event contents are marked as incomplete but are not deleted. In particular, the initialization is kept.

```
<Events: event: TBP>+≡
procedure :: reset => event_reset
<Events: procedures>+≡
subroutine event_reset (event)
  class(event_t), intent(inout) :: event
  class(evt_t), pointer :: evt
  call event%base_reset ()
  event%selected_i_mci = 0
  event%selected_i_term = 0
  event%selected_channel = 0
  event%is_complete = .false.
  call event%expr%reset ()
  event%selection_evaluated = .false.
  event%passed = .false.
  event%analysis_flag = .false.
  if (associated (event%instance)) then
    call event%instance%reset (reset_mci = .true.)
  end if
  if (allocated (event%alpha_qcd_forced)) deallocate (event%alpha_qcd_forced)
  if (allocated (event%scale_forced)) deallocate (event%scale_forced)
  evt => event%transform_first
  do while (associated (evt))
    call evt%reset ()
    evt => evt%next
  end do
end subroutine event_reset
```

### 30.7.6 Squared Matrix Element and Weight

Transfer the result of the process instance calculation to the event record header.

```
<Events: event: TBP>+≡
```

```

procedure :: import_instance_results => event_import_instance_results
⟨Events: procedures⟩+≡
    subroutine event_import_instance_results (event)
        class(event_t), intent(inout) :: event
        if (associated (event%instance)) then
            if (event%instance%has_evaluated_trace ()) then
                call event%set ( &
                    sqme_prc = event%instance%get_sqme (), &
                    weight_prc = event%instance%get_weight (), &

```

### 30.7.7 Generation

Assuming that we have a valid process associated to the event, we generate an event. We complete the event data, then factorize the spin density matrix and transfer it to the particle set.

When done, we retrieve squared matrix element and weight. In case of explicit generation, the reference values coincide with the process values, so we `accept` the latter.

The explicit random number argument `r` should be generated by a random-number generator. It is taken for the factorization algorithm, bypassing the event-specific random-number generator. This is useful for deterministic testing.

```
<Events: event: TBP>+≡
procedure :: generate => event_generate
<Events: procedures>+≡
subroutine event_generate (event, i_mci, r, i_nlo)
  class(event_t), intent(inout) :: event
  integer, intent(in) :: i_mci
  real(default), dimension(:), intent(in), optional :: r
  integer, intent(in), optional :: i_nlo
  logical :: generate_new = .true.
  if (present (i_nlo)) generate_new = (i_nlo == 1)
  if (generate_new) call event%reset ()
  event%selected_i_mci = i_mci
  if (event%config%unweighted) then
    call event%process%generate_unweighted_event (event%instance, i_mci)
    if (signal_is_pending ()) return
    call event%instance%evaluate_event_data ()
    call event%instance%normalize_weight ()
  else
    if (event%nlo_event) &
      call event%process%deactivate_real_component ()
    if (generate_new) call event%process%generate_weighted_event (event%instance, i_mci)
    if (signal_is_pending ()) return
    call event%instance%evaluate_event_data ()
  end if
  event%selected_channel = event%instance%get_channel ()
  call event%import_instance_results ()
  call event%accept_sqme_prc ()
  call event%update_normalization ()
  call event%accept_weight_prc ()
  call event%evaluate_transforms (r)
  if (signal_is_pending ()) return
  call event%check ()
end subroutine event_generate
```

Get a copy of the particle set belonging to the hard process.

```
<Events: event: TBP>+≡
procedure :: get_hard_particle_set => event_get_hard_particle_set
<Events: procedures>+≡
subroutine event_get_hard_particle_set (event, pset)
  class(event_t), intent(in) :: event
  type(particle_set_t), intent(out) :: pset
```

```

    class(evt_t), pointer :: evt
    evt => event%transform_first
    pset = evt%particle_set
end subroutine event_get_hard_particle_set

```

### 30.7.8 Recovering an event

Select MC group, term, and integration channel.

```

⟨Events: event: TBP⟩+≡
procedure :: select => event_select
⟨Events: procedures⟩+≡
subroutine event_select (event, i_mci, i_term, channel)
    class(event_t), intent(inout) :: event
    integer, intent(in) :: i_mci, i_term, channel
    if (associated (event%instance)) then
        event%selected_i_mci = i_mci
        event%selected_i_term = i_term
        event%selected_channel = channel
    else
        call msg_bug ("Event: select term: process instance undefined")
    end if
end subroutine event_select

```

Copy a particle set into the event record.

We deliberately use the first (the trivial) transform for this, i.e., the hard process. The event reader may either read in the transformed event separately, or apply all event transforms to the hard particle set to (re)generate a fully dressed event.

Since this makes all subsequent event transforms invalid, we call `reset` on them.

```

⟨Events: event: TBP⟩+≡
procedure :: set_hard_particle_set => event_set_hard_particle_set
⟨Events: procedures⟩+≡
subroutine event_set_hard_particle_set (event, particle_set)
    class(event_t), intent(inout) :: event
    type(particle_set_t), intent(in) :: particle_set
    class(evt_t), pointer :: evt
    evt => event%transform_first
    call evt%set_particle_set (particle_set, &
        event%selected_i_mci, event%selected_i_term)
    call event%link_particle_set (evt%particle_set)
    evt => evt%next
    do while (associated (evt))
        call evt%reset ()
        evt => evt%next
    end do
end subroutine event_set_hard_particle_set

```

Set the  $\alpha_s$  value that should be used in a recalculation. This should be called only if we explicitly want to override the QCD setting of the process core.

```
<Events: event: TBP>+≡
procedure :: set_alpha_qcd_forced => event_set_alpha_qcd_forced
<Events: procedures>+≡
subroutine event_set_alpha_qcd_forced (event, alpha_qcd)
  class(event_t), intent(inout) :: event
  real(default), intent(in) :: alpha_qcd
  if (allocated (event%alpha_qcd_forced)) then
    event%alpha_qcd_forced = alpha_qcd
  else
    allocate (event%alpha_qcd_forced, source = alpha_qcd)
  end if
end subroutine event_set_alpha_qcd_forced
```

Analogously, for the common scale. This forces also renormalization and factorization scale.

```
<Events: event: TBP>+≡
procedure :: set_scale_forced => event_set_scale_forced
<Events: procedures>+≡
subroutine event_set_scale_forced (event, scale)
  class(event_t), intent(inout) :: event
  real(default), intent(in) :: scale
  if (allocated (event%scale_forced)) then
    event%scale_forced = scale
  else
    allocate (event%scale_forced, source = scale)
  end if
end subroutine event_set_scale_forced
```

Here we try to recover an event from the `particle_set` subobject and recalculate the structure functions and matrix elements. We have the appropriate `process` object and an initialized `process_instance` at hand, so beam and configuration data are known. From the `particle_set`, we get the momenta.

The quantum-number information may be incomplete, e.g., helicity information may be partial or absent. We recover the event just from the momentum configuration.

We do not transfer the matrix element from the process instance to the event record, as we do when generating an event. The event record may contain the matrix element as read from file, and the current calculation may use different parameters. We thus can compare old and new values.

The event `weight` may also be known already. If yes, we pass it to the `evaluate_event_data` procedure. It should already be normalized. If we have an `weight_factor` value, we obtain the event weight by multiplying the computed `sqme` by this factor. Otherwise, we make use of the MCI setup (which should be valid then) to compute the event weight, and we should normalize the result just as when generating events.

Evaluating event expressions must also be done separately.

```
<Events: event: TBP>+≡
procedure :: recalculate => event_recalculate
```

```

<Events: procedures>+≡
subroutine event_recalculate &
    (event, update_sqme, weight_factor, recover_beams)
    class(event_t), intent(inout) :: event
    logical, intent(in) :: update_sqme

## Recovering an event

Generate an event and store the particle set. Then reset the event record, recall the particle set, and recover the event from that.

Note: The extra `particle_set_ptr` auxiliary is a workaround for memory corruption in gfortran 4.7.

```

<Events: execute tests>+≡

## 30.8 Raw Event I/O

The raw format is for internal use only. All data are stored unformatted, so they can be efficiently be re-read on the same machine, but not necessarily on another machine.

This module explicitly depends on the `events` module which provides the concrete implementation of `event_base`. The other I/O formats access only the methods that are defined in `event_base`.

```

<eio_raw.f90>≡
  <File header>

  module eio_raw

    <Use kinds>
    <Use strings>
    use io_units
    use diagnostics
    use model_data
    use particles
    use event_base
    use eio_data
    use eio_base
    use events

    <Standard module head>

  <EIO raw: public>

```

```

⟨EIO raw: parameters⟩

⟨EIO raw: types⟩

contains

⟨EIO raw: procedures⟩

end module eio_raw

```

### 30.8.1 File Format Version

This is the current default file version.

```

⟨EIO raw: parameters⟩≡
    integer, parameter :: CURRENT_FILE_VERSION = 2

```

The user may change this number; this should force some compatibility mode for reading and writing. In any case, the file version stored in a event file that we read has to match the expected file version.

History of version numbers:

1. Format for WHIZARD 2.2.0 to 2.2.3. No version number stored in the raw file.
2. Format from 2.2.4 on. File contains version number. The file contains the transformed particle set (if applicable) after the hard-process particle set.

### 30.8.2 Type

Note the file version number. The default may be reset during initialization, which should enforce some compatibility mode.

```

⟨EIO raw: public⟩≡

      action = "write", position = "append", status = "old")
eio%writing = .true.
if (present (success)) success = .true.
end subroutine eio_raw_switch_inout

```

Output an event. Write first the event indices, then weight and squared matrix element, then the particle set.

We always write the particle set of the hard process. (Note: this should be reconsidered.) We do make a physical copy.

On output, we write the `prc` values for weight and `sqme`, since these are the values just computed. On input, we store the values as `ref` values. The caller can then decide whether to recompute values and thus obtain distinct `prc` values, or just accept them.

The `passed` flag is not written. This allow us to apply different selection criteria upon rereading.

```

## 30.9 User-controlled File I/O

The SINDARIN language includes commands that write output to file (input may be added later). We identify files by their name, and manage the unit internally. We need procedures for opening, closing, and printing files.

```

<user_files.f90>≡
  <File header>

  module user_files

    <Use strings>
    use io_units
    use diagnostics
    use ifiles

```

```

use analysis

⟨Standard module head⟩

⟨User files: public⟩

⟨User files: types⟩

⟨User files: interfaces⟩

contains

⟨User files: procedures⟩

end module user_files

```

### 30.9.1 The file type

This is a type that describes an open user file and its properties. The entry is part of a doubly-linked list.

```

⟨User files: types⟩≡
type :: file_t
  private
  type(string_t) :: name
  integer :: unit = -1
  logical :: reading = .false.
  logical :: writing = .false.
  type(file_t), pointer :: prev => null()
  type(file_t), pointer :: next => null()
end type file_t

```

The initializer opens the file.

```

⟨User files: procedures⟩≡
subroutine file_init (file, name, action, status, position)
  type(file_t), intent(out) :: file
  type(string_t), intent(in) :: name
  character(len=*), intent(in) :: action, status, position
  file%unit = free_unit()
  file%name = name
  open (unit = file%unit, file = char (file%name), &
        action = action, status = status, position = position)
  select case (action)
  case ("read")
    file%reading = .true.
  case ("write")
    file%writing = .true.
  case ("readwrite")
    file%reading = .true.
    file%writing = .true.
  end select
end subroutine file_init

```

The finalizer closes it.

```
(User files: procedures)+≡
subroutine file_final (file)
    type(file_t), intent(inout) :: file
    close (unit = file%unit)
    file%unit = -1
end subroutine file_final
```

Check if a file is open with correct status.

```
(User files: procedures)+≡
function file_is_open (file, action) result (flag)
    logical :: flag
    type(file_t), intent(in) :: file
    character(*), intent(in) :: action
    select case (action)
    case ("read")
        flag = file%reading
    case ("write")
        flag = file%writing
    case ("readwrite")
        flag = file%reading .and. file%writing
    case default
        call msg_bug ("Checking file '" // char (file%name) &
                     // "'": illegal action specifier")
    end select
end function file_is_open
```

Write to the file. Error if in wrong mode. If there is no string, just write an empty record. If there is a string, respect the advancing option.

```
(User files: procedures)+≡
subroutine file_write_string (file, string, advancing)
    type(file_t), intent(in) :: file
    type(string_t), intent(in), optional :: string
    logical, intent(in), optional :: advancing
    if (file%writing) then
        if (present (string)) then
            if (present (advancing)) then
                if (advancing) then
                    write (file%unit, "(A)")  char (string)
                else
                    write (file%unit, "(A)", advance="no")  char (string)
                end if
            else
                write (file%unit, "(A)")  char (string)
            end if
        else
            write (file%unit, *)
        end if
    else
        call msg_error ("Writing to file: File '" // char (file%name) &
                       // "' is not open for writing.")
    end if
end subroutine file_write_string
```

Write a whole ifile, line by line.

```
User files: procedures+≡
subroutine file_write_ifile (file, ifile)
    type(file_t), intent(in) :: file
    type(ifile_t), intent(in) :: ifile
    type(line_p) :: line
    call line_init (line, ifile)
    do while (line_is_associated (line))
        call file_write_string (file, line_get_string_advance (line))
    end do
end subroutine file_write_ifile
```

Write an analysis object (or all objects) to an open file.

```
User files: procedures+≡
subroutine file_write_analysis (file, tag)
    type(file_t), intent(in) :: file
    type(string_t), intent(in), optional :: tag
    if (file%writing) then
        if (present (tag)) then
            call analysis_write (tag, unit = file%unit)
        else
            call analysis_write (unit = file%unit)
        end if
    else
        call msg_error ("Writing analysis to file: File '" // char (file%name) &
                       // "' is not open for writing.")
    end if
end subroutine file_write_analysis
```

### 30.9.2 The file list

We maintain a list of all open files and their attributes. The list must be doubly-linked because we may delete entries.

```
User files: public≡
public :: file_list_t

User files: types+≡
type :: file_list_t
    type(file_t), pointer :: first => null ()
    type(file_t), pointer :: last => null ()
end type file_list_t
```

There is no initialization routine, but a finalizer which deletes all:

```
User files: public+≡
public :: file_list_final

User files: procedures+≡
subroutine file_list_final (file_list)
    type(file_list_t), intent(inout) :: file_list
    type(file_t), pointer :: current
```

```

do while (associated (file_list%first))
    current => file_list%first
    file_list%first => current%next
    call file_final (current)
    deallocate (current)
end do
file_list%last => null ()
end subroutine file_list_final

```

Find an entry in the list. Return null pointer on failure.

*(User files: procedures)*+≡

```

function file_list_get_file_ptr (file_list, name) result (current)
    type(file_t), pointer :: current
    type(file_list_t), intent(in) :: file_list
    type(string_t), intent(in) :: name
    current => file_list%first
    do while (associated (current))
        if (current%name == name) return
        current => current%next
    end do
end function file_list_get_file_ptr

```

Check if a file is open, public version:

*(User files: public)*+≡

```
public :: file_list_is_open
```

*(User files: procedures)*+≡

```

function file_list_is_open (file_list, name, action) result (flag)
    logical :: flag
    type(file_list_t), intent(in) :: file_list
    type(string_t), intent(in) :: name
    character(len=*), intent(in) :: action
    type(file_t), pointer :: current
    current => file_list_get_file_ptr (file_list, name)
    if (associated (current)) then
        flag = file_is_open (current, action)
    else
        flag = .false.
    end if
end function file_list_is_open

```

Append a new file entry, i.e., open this file. Error if it is already open.

*(User files: public)*+≡

```
public :: file_list_open
```

*(User files: procedures)*+≡

```

subroutine file_list_open (file_list, name, action, status, position)
    type(file_list_t), intent(inout) :: file_list
    type(string_t), intent(in) :: name
    character(len=*), intent(in) :: action, status, position
    type(file_t), pointer :: current
    if (.not. associated (file_list_get_file_ptr (file_list, name))) then
        allocate (current)

```

```

call msg_message ("Opening file '" // char (name) // "' for output")
call file_init (current, name, action, status, position)
if (associated (file_list%last)) then
    file_list%last%next => current
    current%prev => file_list%last
else
    file_list%first => current
end if
file_list%last => current
else
    call msg_error ("Opening file: File '" // char (name) &
                   // "' is already open.")
end if
end subroutine file_list_open

```

Delete a file entry, i.e., close this file. Error if it is not open.

```

<User files: public>+≡
public :: file_list_close

<User files: procedures>+≡

### 30.10.1 Strategy for models and variables

The program manages its data via a main `rt_data_t` object. During program flow, various commands create and use local `rt_data_t` objects. Those transient blocks contain either pointers to global object or local copies which are deleted after use.

Each `rt_data_t` object contains a variable list component. This lists holds (local copies of) all kinds of intrinsic or user-defined variables. The variable list is linked to the variable list contained in the local process library. This, in turn, is linked to the variable list of the `rt_data_t` context, and so on.

A variable lookup will thus be recursively delegated to the linked variable lists, until a match is found. When modifying a variable which is not yet local, the program creates a local copy and uses this afterwards. Thus, when the local `rt_data_t` object is deleted, the context value is recovered.

Models are kept in a model list which is separate from the variable list. Otherwise, they are treated in a similar manner: the local list is linked to the context model list. Model lookup is thus recursively delegated. When a model or any part of it is modified, the model is copied to the local `rt_data_t` object, so the context model is not modified. Commands such as `integrate` will create their own copy of the current model (and of the current variable list) at the point where they are executed.

When a model is encountered for the first time, it is read from file. The reading is automatically delegated to the global context. Thus, this master copy survives until the main `rt_data_t` object is deleted, at program completion.

If there is a currently active model, its variable list is linked to the main variable list. Variable lookups will then start from the model variable list. When the current model is switched, the new active model will get this link instead. Consequently, a change to the current model is kept as long as this model has a local copy; it survives local model switches. On the other hand, a parameter change in the current model doesn't affect any other model, even if the parameter name is identical.

### 30.10.2 Container for parse nodes

The runtime data set contains a bunch of parse nodes (chunks of code that have not been compiled into evaluation trees but saved for later use). We collect them here.

This implementation has the useful effect that an assignment between two objects of this type will establish a pointer-target relationship for all components.

```
(RT data: types)≡
  type :: rt_parse_nodes_t
    type(parse_node_t), pointer :: cuts_expr => null ()
    type(parse_node_t), pointer :: scale_expr => null ()
    type(parse_node_t), pointer :: fac_scale_expr => null ()
    type(parse_node_t), pointer :: ren_scale_expr => null ()
    type(parse_node_t), pointer :: weight_expr => null ()
    type(parse_node_t), pointer :: selection_expr => null ()
    type(parse_node_t), pointer :: reweight_expr => null ()
    type(parse_node_t), pointer :: analysis_expr => null ()
    type(parse_node_p), dimension(:), allocatable :: alt_setup
  contains
(RT data: rt parse nodes: TBP)
end type rt_parse_nodes_t
```

Clear individual components. The parse nodes are nullified. No finalization needed since the pointer targets are part of the global parse tree.

```
(RT data: rt parse nodes: TBP)≡
  procedure :: clear => rt_parse_nodes_clear
```

```

⟨RT data: procedures⟩≡
  subroutine rt_parse_nodes_clear (rt_pn, name)
    class(rt_parse_nodes_t), intent(inout) :: rt_pn
    type(string_t), intent(in) :: name
    select case (char (name))
    case ("cuts")
      rt_pn%cuts_expr => null ()
    case ("scale")
      rt_pn%scale_expr => null ()
    case ("factorization_scale")
      rt_pn%fac_scale_expr => null ()
    case ("renormalization_scale")
      rt_pn%ren_scale_expr => null ()
    case ("weight")
      rt_pn%weight_expr => null ()
    case ("selection")
      rt_pn%selection_expr => null ()
    case ("reweight")
      rt_pn%reweight_expr => null ()
    case ("analysis")
      rt_pn%analysis_expr => null ()
    end select
  end subroutine rt_parse_nodes_clear

```

Output for the parse nodes.

```

⟨RT data: rt parse nodes: TBP⟩+≡
  procedure :: write => rt_parse_nodes_write
⟨RT data: procedures⟩+≡

```

### 30.10.5 Clear

The **clear** command can remove the contents of various subobjects. The objects themselves should stay.

```

⟨RT data: rt data: TBP⟩+≡
procedure :: clear_beams => rt_data_clear_beams
⟨RT data: procedures⟩+≡
subroutine rt_data_clear_beams (global)
  class(rt_data_t), intent(inout) :: global
  call global%beam_structure%final_sf ()
  call global%beam_structure%final_pol ()
  call global%beam_structure%final_mom ()
end subroutine rt_data_clear_beams

```

### 30.10.6 Initialization

Initialize runtime data. This defines special variables such as `sqrts`, and should be done only for the instance that is actually global. Local copies will inherit the special variables.

We link the global variable list to the process stack variable list, so the latter is always available (and kept global).

```

⟨RT data: rt data: TBP⟩+≡
procedure :: global_init => rt_data_global_init
⟨RT data: procedures⟩+≡
subroutine rt_data_global_init (global, paths, logfile)
    class(rt_data_t), intent(out), target :: global

### 30.10.7 Local copies

This is done at compile time when a local copy of runtime data is needed: Link the variable list and initialize all derived parameters. This allows for synchronizing them with local variable changes without affecting global data.

Also re-initialize pointer variables, so they point to local copies of their targets.

```

⟨RT data: rt data: TBP⟩+≡
procedure :: local_init => rt_data_local_init
⟨RT data: procedures⟩+≡
subroutine rt_data_local_init (local, global, env)
  class(rt_data_t), intent(inout), target :: local
  type(rt_data_t), intent(in), target :: global
  integer, intent(in), optional :: env
  local%context => global
  call local%process_stack%link (global%process_stack)
  call local%process_stack%init_var_list (local%var_list)
  call local%process_stack%link_var_list (global%var_list)
  call var_list_append_string &
    (local%var_list, var_str ("$model_name"), var_str (""), &
     intrinsic=.true.)
  call local%init_pointer_variables ()
  local%fallback_model => global%fallback_model
  local%radiation_model => global%radiation_model
  local%os_data = global%os_data
  local%logfile = global%logfile
  call local%model_list%link (global%model_list)
  local%model => global%model
  if (associated (local%model)) then
    call local%model%link_var_list (local%var_list)
  end if
end subroutine rt_data_local_init

```

These variables point to objects which get local copies:

```

⟨RT data: rt data: TBP⟩+≡
procedure :: init_pointer_variables => rt_data_init_pointer_variables
⟨RT data: procedures⟩+≡
subroutine rt_data_init_pointer_variables (local)
  class(rt_data_t), intent(inout), target :: local
  logical, target, save :: known = .true.
  call var_list_append_string_ptr &
    (local%var_list, var_str ("$fc"), local%os_data%fc, known, &
     intrinsic=.true.)
  call var_list_append_string_ptr &
    (local%var_list, var_str ("$fcflags"), local%os_data%fcflags, known, &
     intrinsic=.true.)

```

```

    intrinsic=.true.)
end subroutine rt_data_init_pointer_variables

```

This is done at execution time: Copy data, transfer pointers. `local` has `intent(inout)` because its local variable list has already been prepared by the previous routine.

To be pedantic, the local pointers to model and library should point to the entries in the local copies. (However, as long as these are just shallow copies with identical content, this is actually irrelevant.)

The process library and process stacks behave as global objects. The copies of the process library and process stacks should be shallow copies, so the contents stay identical. Since objects may be pushed on the stack in the local environment, upon restoring the global environment, we should reverse the assignment. Then the added stack elements will end up on the global stack. (This should be reconsidered in a parallel environment.)

```

<RT data: rt data: TBP>+≡
procedure :: activate => rt_data_activate
<RT data: procedures>+≡
subroutine rt_data_activate (local)
  class(rt_data_t), intent(inout), target :: local
  class(rt_data_t), pointer :: global
  global => local%context

  end if
end subroutine rt_data_activate

```

```

    else
        call local%var_list%set_string (var_str ("$model_name"), &
            var_str (""), is_known = .false.)
    end if
end subroutine rt_data_activate

```

Restore the previous state of data, without actually finalizing the local environment. We also clear the local process stack. Some local modifications (model list and process library stack) are communicated to the global context, if there is any.

If the `keep_local` flag is set, we want to retain current settings in the local environment. In particular, we create an instance of the currently selected model (which thus becomes separated from the model library!). The local variables are also kept.

```

<RT data: rt data: TBP>+≡
procedure :: deactivate => rt_data_deactivate
<RT data: procedures>+≡
subroutine rt_data_deactivate (local, global, keep_local)
    class(rt_data_t), intent(inout), target :: local
    class(rt_data_t), intent(inout), optional, target :: global
    logical, intent(in), optional :: keep_local
    type(string_t) :: global_model, local_model
    logical :: same_model, delete
    delete = .true.; if (present (keep_local)) delete = .not. keep_local
    if (present (global)) then
        if (associated (global%model) .and. associated (local%model)) then
            global_model = global%model%get_name ()
            local_model = local%model%get_name ()
            same_model = global_model == local_model
        else
            same_model = .false.
        end if
        if (delete) then
            call local%process_stack%clear ()
            call local%unselect_model ()
            call local%unset_values ()
        else if (associated (local%model)) then
            call local%ensure_model_copy ()
        end if
        if (.not. same_model .and. global_model /= "") then
            call msg_message ("Restoring model '" // char (global_model) // "'")
        end if
        if (associated (global%model)) then
            call global%model%link_var_list (global%var_list)
        end if
        call global%restore_globals (local)
    else
        call local%unselect_model ()
    end if
end subroutine rt_data_deactivate

```

This imports the global objects for which local modifications should be kept. Currently, this is only the process library stack.

```
(RT data: rt data: TBP)+≡
    procedure :: copy_globals => rt_data_copy_globals
(RT data: procedures)+≡
    subroutine rt_data_copy_globals (global, local)
        class(rt_data_t), intent(in) :: global
        class(rt_data_t), intent(inout) :: local
        local%prclib_stack = global%prclib_stack
    end subroutine rt_data_copy_globals
```

This restores global objects, for which local modifications should be kept.

```
(RT data: rt data: TBP)+≡
    procedure :: restore_globals => rt_data_restore_globals
(RT data: procedures)+≡
    subroutine rt_data_restore_globals (global, local)
        class(rt_data_t), intent(inout) :: global
        class(rt_data_t), intent(in) :: local
        global%prclib_stack = local%prclib_stack
    end subroutine rt_data_restore_globals
```

### 30.10.8 Finalization

Finalizer for the variable list and the structure-function list. This is done only for the global RT dataset; local copies contain pointers to this and do not need a finalizer.

```
(RT data: rt data: TBP)+≡
    procedure :: final => rt_data_global_final
(RT data: procedures)+≡
    subroutine rt_data_global_final (global)
        class(rt_data_t), intent(inout) :: global
        call global%process_stack%final ()
        call global%prclib_stack%final ()
        call global%model_list%final ()
        call global%var_list%final (follow_link=.false.)
        if (associated (global%out_files)) then
            call file_list_final (global%out_files)
            deallocate (global%out_files)
        end if
    end subroutine rt_data_global_final
```

The local copy needs a finalizer for the variable list, which consists of local copies. This finalizer is called only when the local environment is finally discarded. (Note that the process stack should already have been cleared after execution, which can occur many times for the same local environment.)

```
(RT data: rt data: TBP)+≡
    procedure :: local_final => rt_data_local_final
```

```

<RT data: procedures>+≡
    subroutine rt_data_local_final (local)
        class(rt_data_t), intent(inout) :: local
        call local%process_stack%clear ()
        call local%model_list%final ()
        call local%var_list%final (follow_link=.false.)
    end subroutine rt_data_local_final

```

### 30.10.9 Model Management

Read a model, so it becomes available for activation. No variables or model copies, this is just initialization.

If this is a local environment, the model will be automatically read into the global context.

```

<RT data: rt data: TBP>+≡
    procedure :: read_model => rt_data_read_model

<RT data: procedures>+≡
    subroutine rt_data_read_model (global, name, model)
        class(rt_data_t), intent(inout) :: global
        type(string_t), intent(in) :: name
        type(model_t), pointer, intent(out) :: model
        type(string_t) :: filename
        filename = name // ".mdl"
        call global%model_list%read_model &
            (name, filename, global%os_data, model)
    end subroutine rt_data_read_model

```

Initialize the fallback model. This model is used whenever the current model does not describe all physical particles (hadrons, mainly). It is not supposed to be modified, and the pointer should remain linked to this model.

```

<RT data: rt data: TBP>+≡
    procedure :: initFallback_model => rt_data_initFallback_model

<RT data: procedures>+≡
    subroutine rt_data_initFallback_model (global, name, filename)
        class(rt_data_t), intent(inout) :: global
        type(string_t), intent(in) :: name, filename
        call global%model_list%read_model &
            (name, filename, global%os_data, global%fallback_model)
    end subroutine rt_data_initFallback_model

```

Initialize the radiation model. This model is used by a radiation-generator algorithm which is part of the NLO machinery. It is not supposed to be modified, and the pointer should remain linked to this model.

```

<RT data: rt data: TBP>+≡
    procedure :: initRadiation_model => rt_data_initRadiation_model

<RT data: procedures>+≡
    subroutine rt_data_initRadiation_model (global, name, filename)
        class(rt_data_t), intent(inout) :: global
        type(string_t), intent(in) :: name, filename

```

```

    call global%model_list%read_model &
        (name, filename, global%os_data, global%radiation_model)
end subroutine rt_data_init_radiation_model

```

Activate a model: assign the current-model pointer and set the model name in the variable list. If necessary, read the model from file. Link the global variable list to the model variable list.

```

<RT data: rt data: TBP>+≡
procedure :: select_model => rt_data_select_model
<RT data: procedures>+≡
subroutine rt_data_select_model (global, name)
    class(rt_data_t), intent(inout), target :: global
    type(string_t), intent(in) :: name
    logical :: same_model
    if (associated (global%model)) then
        same_model = global%model%get_name () == name
    else
        same_model = .false.
    end if
    if (.not. same_model) then
        global%model => global%model_list%get_model_ptr (name)
        if (.not. associated (global%model)) then

            global%model_is_copy = .false.
        else if (associated (global%context)) then
            global%model_is_copy = &
                global%model_list%model_exists (name, follow_link=.false.)
        else
            global%model_is_copy = .false.
        end if
    end if
    if (associated (global%model)) then
        call global%model%link_var_list (global%var_list)
        call global%var_list%set_string (var_str ("$model_name"), &
            name, is_known = .true.)
        call msg_message ("Switching to model '" // char (name) // "'")
    else
        call global%var_list%set_string (var_str ("$model_name"), &
            var_str (""), is_known = .false.)
    end if
end subroutine rt_data_select_model

```

Remove the model link and unset the model name variable.

```

<RT data: rt data: TBP>+≡
procedure :: unselect_model => rt_data_unselect_model
<RT data: procedures>+≡
subroutine rt_data_unselect_model (global)
    class(rt_data_t), intent(inout), target :: global
    if (associated (global%model)) then
        global%model => null ()
        global%model_is_copy = .false.
        call global%var_list%set_string (var_str ("$model_name"), &

```

```

        var_str (""), is_known = .false.)
    end if
end subroutine rt_data_unselect_model

```

Create a copy of the currently selected model and append it to the local model list. The model pointer is redirected to the copy. (Not applicable for the global model list, those models will be modified in-place.)

```

⟨RT data: rt data: TBP⟩+≡
procedure :: ensure_model_copy => rt_data_ensure_model_copy
⟨RT data: procedures⟩+≡
subroutine rt_data_ensure_model_copy (global)
    class(rt_data_t), intent(inout), target :: global
    if (associated (global%context)) then
        if (.not. global%model_is_copy) then
            call global%model_list%append_copy (global%model, global%model)
            global%model_is_copy = .true.
            call global%model%link_var_list (global%var_list)
        end if
    end if
end subroutine rt_data_ensure_model_copy

```

Modify a model variable. The update mechanism will ensure that the model parameter set remains consistent. This has to take place in a local copy of the current model. If there is none yet, create one.

```

⟨RT data: rt data: TBP⟩+≡
procedure :: model_set_real => rt_data_model_set_real
⟨RT data: procedures⟩+≡
subroutine rt_data_model_set_real (global, name, rval, verbose, pacified)
    class(rt_data_t), intent(inout), target :: global

### Initial content

Force system-dependent objects to well-defined values. Some of the variables are locked and therefore must be addressed directly.

This is, of course, only required for testing purposes. In principle, the `real_specimen` variables could be set to their values in `rt_data_t`, but this depends on the precision again, so we set them to some dummy values.

```

 〈RT data: test auxiliary〉≡

## 30.11 Select implementations

For abstract types (process core, integrator, phase space, etc.), we need a way to dynamically select a concrete type, using either data given by the user or a previous selection of a concrete type. This is done by subroutines in the current module.

This module provides no new types, just procedures.

```

end subroutine dispatch_core_def

```

### 30.11.2 Process core allocation

Here we allocate an object of abstract type prc\_core\_t with a concrete type that matches a process definition. The prc\_omega\_t extension will require the current parameter set, so we take the opportunity to grab it from the model.

```

<Dispatch: public>+≡
    public :: dispatch_core

<Dispatch: procedures>+≡
    subroutine dispatch_core (core, core_def, model, &
        helicity_selection, qcd, use_color_factors)

        class(prc_core_t), allocatable, intent(inout) :: core
        class(prc_core_def_t), intent(in) :: core_def
        class(model_data_t), intent(in), target, optional :: model
        type(helicity_selection_t), intent(in), optional :: helicity_selection
        type(qcd_t), intent(in), optional :: qcd
        logical, intent(in), optional :: use_color_factors

        select type (core_def)
        type is (prc_test_def_t)
            allocate (test_t :: core)
        type is (template_me_def_t)
            allocate (prc_template_me_t :: core)
            select type (core)
            type is (prc_template_me_t)
                call core%set_parameters (model)
            end select
        class is (omega_def_t)
            if (.not. allocated (core)) allocate (prc_omega_t :: core)

```

```

    select type (core)
    type is (prc_omega_t)
        call core%set_parameters (model, &
            helicity_selection, qcd, use_color_factors)
    end select
    type is (gosam_def_t)
        if (.not. allocated (core)) allocate (prc_gosam_t :: core)
        select type (core)
        type is (prc_gosam_t)
            call core%set_parameters (qcd, use_color_factors)
        end select
        type is (openloops_def_t)
            if (.not. allocated (core)) allocate (prc_openloops_t :: core)
            select type (core)
            type is (prc_openloops_t)
                call core%set_parameters (qcd, use_color_factors)
            end select
        class default
            call msg_bug ("Process core: unexpected process definition type")
        end select
    end subroutine dispatch_core

```

### 30.11.3 Process core update and restoration

Here we take an existing object of abstract type `prc_core_t` and update the parameters as given by the current state of `model`. Optionally, we can save the previous state as `saved_core`. The second routine restores the original from the save.

(In the test case, there is no possible update.)

```

⟨Dispatch: public⟩+≡
    public :: dispatch_core_update
    public :: dispatch_core_restore

⟨Dispatch: procedures⟩+≡
    subroutine dispatch_core_update (core, model, helicity_selection, qcd, &
        saved_core)

        class(prc_core_t), allocatable, intent(inout) :: core
        class(model_data_t), intent(in), optional, target :: model
        type(helicity_selection_t), intent(in), optional :: helicity_selection
        type(qcd_t), intent(in), optional :: qcd
        class(prc_core_t), allocatable, intent(inout), optional :: saved_core

        if (present (saved_core)) then
            allocate (saved_core, source = core)
        end if
        select type (core)
        type is (test_t)
        type is (prc_omega_t)
            call core%set_parameters (model, helicity_selection, qcd)
            call core%activate_parameters ()
        type is (prc_gosam_t)

```

```

    call msg_message ("dispatch core restore: Gosam implementation not present yet!")
class default
    call msg_bug ("Process core update: unexpected process definition type")
end select
end subroutine dispatch_core_update

subroutine dispatch_core_restore (core, saved_core)

    class(prc_core_t), allocatable, intent(inout) :: core
    class(prc_core_t), allocatable, intent(inout) :: saved_core

    call move_alloc (from = saved_core, to = core)
    select type (core)
    type is (test_t)
    type is (prc_omega_t)
        call core%activate_parameters ()
    class default
        call msg_bug ("Process core restore: unexpected process definition type")
    end select
end subroutine dispatch_core_restore

```

### 30.11.4 Integrator allocation

Allocate an integrator according to the variable \$integration\_method.

```

<Dispatch: public>+≡
    public :: dispatch_mci

<Dispatch: procedures>+≡
    subroutine dispatch_mci (mci, global, process_id, is_nlo)

        class(mci_t), allocatable, intent(inout) :: mci

```

### 30.11.6 FKS parameter

Initialize parameters used to optimize FKS calculations.

```

<Dispatch: public>+≡
public :: dispatch_fks

<Dispatch: procedures>+≡
subroutine dispatch_fks (fks_template, global)

type(fks_template_t), intent(inout) :: fks_template
type(rt_data_t), intent(in) :: global
real(default) :: fks_dij_exp1, fks_dij_exp2
integer :: fks_mapping_type
logical :: kinematics_counter_active

fks_dij_exp1 = &
    global%var_list%get_rval (var_str ("fks_dij_exp1"))
fks_dij_exp2 = &
    global%var_list%get_rval (var_str ("fks_dij_exp2"))
fks_mapping_type = &
    global%var_list%get_ival (var_str ("fks_mapping_type"))
kinematics_counter_active = &

```

```

global%var_list%get_lval (var_str ("?fks_count_kinematics"))

call fks_template%set_dij_exp (fks_dij_exp1, fks_dij_exp2)
call fks_template%set_mapping_type (fks_mapping_type)

end subroutine dispatch_fks

```

### 30.11.7 Random-number generator

Allocate a random-number generator factory according to the variable `$rng_method`, using the current seed in the global record. We take only the lower 15 bits of the seed, so the actual value fits into a positive 16-bit signed integer.

Since we want to guarantee that all random-number generators in a run are independent, we increment the global seed by one after creating the rng factory. If the user wants to have identical sequences, he can always set the seed manually, before it is used.

```

⟨Dispatch: public⟩+≡
public :: dispatch_rng_factory

⟨Dispatch: procedures⟩+≡
subroutine dispatch_rng_factory (rng_factory, global, local_input)
  class(rng_factory_t), allocatable, intent(inout) :: rng_factory
  type(rt_data_t), intent(inout), target :: global
  type(rt_data_t), intent(in), target, optional :: local_input
  type(rt_data_t), pointer :: local
  type(string_t) :: rng_method
  integer :: seed
  character(30) :: buffer
  integer(i16) :: s
  if (present (local_input)) then
    local => local_input
  else
    local => global
  end if
  rng_method = &
    local%var_list%get_sval (var_str ("$rng_method"))
  seed = &
    local%var_list%get_ival (var_str ("seed"))
  s = int (mod (seed, 32768), i16)
  select case (char (rng_method))
  case ("tao")
    allocate (rng_tao_factory_t :: rng_factory)
    call msg_message ("RNG: Initializing TAO random-number generator")
  case default
    if (associated (dispatch_rng_factory_extra)) then
      call dispatch_rng_factory_extra (rng_factory, global, local_input)
    end if
    if (.not. allocated (rng_factory)) then
      call msg_fatal ("Random-number generator '" &
                     // char (rng_method) // "' not implemented")
    end if
  end select

```

```

    write (buffer, "(IO)")  s
    call msg_message ("RNG: Setting seed for random-number generator to " &
                      // trim (buffer))
    call rng_factory%init (s)
    call global%set_int (var_str ("seed"), seed + 1, &
                         is_known = .true.)
end subroutine dispatch_rng_factory

```

This is a hook that allows us to inject further handlers for RNG factory objects, in particular a test RNG.

```

<Dispatch: public>+≡
    public :: dispatch_rng_factory_extra
<Dispatch: variables>≡
    procedure (dispatch_rng_factory), pointer :: &
        dispatch_rng_factory_extra => null ()

```

### 30.11.8 Structure function configuration data

This data type is a container for transferring structure-function specific data from the `dispatch_sf_data` to the `dispatch_sf_channels` subroutine.

```

<Dispatch: public>+≡
    public :: sf_prop_t
<Dispatch: types>≡
    type :: sf_prop_t
        real(default), dimension(2) :: isr_eps = 1
    end type sf_prop_t

```

Allocate a structure-function configuration object according to the `sf_method` string.

The `sf_prop` object can be used to transfer structure-function specific data up and to the `dispatch_sf_channels` subroutine below, so they can be used for particular mappings.

The `global` object is intent(inout) because the RNG generator seed may change during initialization.

The `pdg_in` array is the array of incoming flavors, corresponding to the upstream structure function or the beam array. This will be checked for the structure function in question and replaced by the outgoing flavors. The `pdg_prc` array is the array of incoming flavors (beam index, component index) for the hard process.

```

<Dispatch: public>+≡
    public :: dispatch_sf_data
<Dispatch: procedures>+≡
    subroutine dispatch_sf_data (data, sf_method, i_beam, sf_prop, global, &
                                pdg_in, pdg_prc, polarized)

        class(sf_data_t), allocatable, intent(inout) :: data
        type(string_t), intent(in) :: sf_method
        integer, dimension(:, ), intent(in) :: i_beam

```

This is a hook that allows us to inject further handlers for structure-function objects, in particular a test structure function.

```

<Dispatch: public>+≡
public :: dispatch_sf_data_extra
<Dispatch: variables>+≡
procedure (dispatch_sf_data), pointer :: &
    dispatch_sf_data_extra => null ()

```

This is an auxiliary procedure, used by the beam-structure expansion: tell for a given structure function name, whether it corresponds to a pair spectrum ( $n = 2$ ), a single-particle structure function ( $n = 1$ ), or nothing ( $n = 0$ ). Though `energy_scan` can in principle also be a pair spectrum, it always has only one parameter.

```

<Dispatch: procedures>+≡
function strfun_mode (name) result (n)
    type(string_t), intent(in) :: name
    integer :: n
    select case (char (name))
    case ("none")
        n = 0

        "lhapdf", "lhapdf_photon")
        n = 1
    case ("isr", "epa", "ewa")
        n = 1
    case ("circe1", "circe2")
        n = 2
    end select
end function

```

```

    case ("gaussian")
        n = 2
    case ("beam_events")
        n = 2
    case ("energy_scan")
        n = 2
    case default
        n = -1
        call msg_bug ("Structure function '" // char (name) &
                      // "' not supported yet")
    end select
end function strfun_mode

```

Dispatch a whole structure-function chain, given beam data and beam structure data.

This could be done generically, but we should look at the specific combination of structure functions in order to select appropriate mappings.

The `beam_structure` argument gets copied because we want to expand it to canonical form (one valid structure-function entry per record) before proceeding further.

The `pdg_prc` argument is the array of incoming flavors. The first index is the beam index, the second one the process component index. Each element is itself a PDG array, not trivial if there is a flavor sum for the incoming state of this component.

The dispatcher is divided in two parts. The first part configures the structure function data themselves. After this, we can configure the phase space for the elementary process.

```

<Dispatch: public>+≡
public :: dispatch_sf_config

<Dispatch: procedures>+≡
subroutine dispatch_sf_config (sf_config, sf_prop, global, pdg_prc)

    type(sf_config_t), dimension(:), allocatable, intent(out) :: sf_config
    type(sf_prop_t), intent(out) :: sf_prop
    type(rt_data_t), intent(inout) :: global
    type(beam_structure_t) :: beam_structure
    class(sf_data_t), allocatable :: sf_data
    type(pdg_array_t), dimension(:, :, ), intent(in) :: pdg_prc
    type(string_t), dimension(:), allocatable :: prt_in
    type(pdg_array_t), dimension(:, ), allocatable :: pdg_in
    type(flavor_t) :: flv_in
    integer :: n_beam, n_record, i

    beam_structure = global%beam_structure
    call beam_structure%expand (strfun_mode)
    n_record = beam_structure%get_n_record ()
    allocate (sf_config (n_record))
    n_beam = beam_structure%get_n_beam ()
    if (n_beam > 0) then
        allocate (prt_in (n_beam), pdg_in (n_beam))
        prt_in = beam_structure%get_prts ()
        do i = 1, n_beam

```

```

        call flv_in%init (prt_in(i), global%model)
        pdg_in(i) = flv_in%get_pdg ()
    end do
else
    n_beam = size (pdg_prc, 1)
    allocate (pdg_in (n_beam))
    pdg_in = pdg_prc(:,1)
end if
do i = 1, n_record
    call dispatch_sf_data (sf_data, &
        beam_structure%get_name (i), &
        beam_structure%get_i_entry (i), &
        sf_prop, global, pdg_in, pdg_prc, &
        beam_structure%polarized ())
    call sf_config(i)%init (beam_structure%get_i_entry (i), sf_data)
    deallocate (sf_data)
end do
end subroutine dispatch_sf_config

```

The second part configures channel mappings, using some conditions from the phase space configuration. If there are no structure functions, we enable a default setup with a single (dummy) structure-function channel. Otherwise, we look at the channel collection that we got from the phase-space configuration step. Each entry should be translated into an independent structure-function channel, where typically there is one default entry, which could be mapped using a standard s-channel mapping if the structure function setup recommends this, and other entries with s-channel resonances. The latter need to be translated into global mappings from the structure-function chain.

```

<Dispatch: public>+≡

### 30.11.10 QCD coupling

Allocate the `alpha` (running coupling) component of the `qcd` block with a concrete implementation, depending on the variable settings in the `global` record.

If a fixed  $\alpha_s$  is requested, we do not allocate the `qcd%alpha` object. In this case, the matrix element code will just take the model parameter as-is, which implies fixed  $\alpha_s$ . If the object is allocated, the  $\alpha_s$  value is computed and updated for each matrix-element call.

```

### 30.12.1 Data Type

```
<Process configurations: public>≡
  public :: process_configuration_t

<Process configurations: types>≡
  type :: process_configuration_t
    type(process_def_entry_t), pointer :: entry => null ()
    type(string_t) :: id
    integer :: num_id = 0
  contains
    <Process configurations: process configuration: TBP>
  end type process_configuration_t
```

Initialize a process. We only need the name, the number of incoming particles, and the number of components.

```
<Process configurations: process configuration: TBP>≡
  procedure :: init => process_configuration_init
```

```

⟨Process configurations: procedures⟩≡
    subroutine process_configuration_init &
        (config, prc_name, n_in, n_components, global)
        class(process_configuration_t), intent(out) :: config
        type(string_t), intent(in) :: prc_name
        integer, intent(in) :: n_in
        integer, intent(in) :: n_components
        type(rt_data_t), intent(in) :: global
        type(model_t), pointer :: model
        model => global%model
        config%id = prc_name
        allocate (config%entry)
        if (global%var_list%is_known (var_str ("process_num_id"))) then
            config%num_id = &

                nlo_process = global%nlo_calculation)
        end if
    end subroutine process_configuration_init

```

Initialize a process component. The details depend on the process method, which determines the type of the process component core. We set the incoming and outgoing particles (as strings, to be interpreted by the process driver). All other information is taken from the variable list.

The dispatcher gets only the names of the particles. The process component definition gets the complete specifiers which contains a polarization flag and names of decay processes, where applicable.

```

    ⟨Process configurations: execute tests⟩
    end subroutine process_configurations_test

```

### Minimal setup

The workflow for setting up a minimal process configuration with the test matrix element method.

We wrap this in a public procedure, so we can reuse it in later modules. The procedure prepares a process definition list for two processes (one `prc_test` and one `omega` type) and appends this to the process library stack in the global data set.

The `mode` argument determines which processes to build.

The `procname` argument replaces the predefined procname(s).

This is re-exported by the UT module.

```

⟨Process configurations: public test auxiliary⟩≡
    public :: prepare_test_library

⟨Process configurations: test auxiliary⟩≡

## 30.13 Compilation

This module manages compilation and loading of process libraries. It is needed as a separate module because integration depends on it.

```
(compilations.f90)≡
  ⟨File header⟩

  module compilations

    ⟨Use strings⟩
    use io_units
    use system_defs, only: TAB
    use diagnostics
    use os_interface
    use variables
    use model_data
    use process_libraries
    use prclib_stacks
    use rt_data

    ⟨Standard module head⟩

    ⟨Compilations: public⟩

    ⟨Compilations: types⟩

    contains

    ⟨Compilations: procedures⟩

  end module compilations
```

### 30.13.1 The data type

The compilation item handles the compilation and loading of a single process library.

```
(Compilations: public)≡
  public :: compilation_item_t

⟨Compilations: types⟩≡
  type :: compilation_item_t
    private
    type(string_t) :: libname
    type(string_t) :: static_external_tag
    type(process_library_t), pointer :: lib => null ()
    logical :: recompile_library = .false.
  contains
  ⟨Compilations: compilation item: TBP⟩
end type compilation_item_t
```

Initialize:

```
(Compilations: compilation item: TBP)≡
  procedure :: init => compilation_item_init
```

```

⟨Compilations: procedures⟩≡
    subroutine compilation_item_init (comp, libname, stack, var_list)

        end if
    end subroutine compilation_item_success

```

### 30.13.2 API for library compilation and loading

This is a shorthand for compiling and loading a single library. The `compilation_item` object is used only internally.

The `global` data set may actually be local to the caller. The compilation affects the library specified by its name if it is on the stack, but it does not reset the currently selected library.

```

⟨Compilations: public⟩+≡
    public :: compile_library
⟨Compilations: procedures⟩+≡
    subroutine compile_library (libname, global)
        type(string_t), intent(in) :: libname
        type(rt_data_t), intent(inout), target :: global
        type(compilation_item_t) :: comp
        logical :: force, recompile
        force = &
            global%var_list%get_lval (var_str ("?rebuild_library"))
        recompile = &
            global%var_list%get_lval (var_str ("?recompile_library"))
        if (associated (global%model)) then
            call comp%init (libname, global%prclib_stack, global%var_list)
            call comp%compile (global%model, global%os_data, force, recompile)
            if (signal_is_pending ()) return
            call comp%load (global%os_data)
            if (signal_is_pending ()) return
        else

```

```

call msg_fatal ("Process library compilation: " &
               // " model is undefined.")
end if
call comp%success ()
end subroutine compile_library

```

### 30.13.3 Compiling static executable

This object handles the creation of a static executable which should contain a set of static process libraries.

```

⟨Compilations: public⟩+≡
  public :: compilation_t

⟨Compilations: types⟩+≡
  type :: compilation_t
    private
    type(string_t) :: exe_name
    type(string_t), dimension(:), allocatable :: lib_name
    contains
      ⟨Compilations: compilation: TBP⟩
  end type compilation_t

```

Output.

```

⟨Compilations: compilation: TBP⟩≡
  procedure :: write => compilation_write

⟨Compilations: procedures⟩+≡
  subroutine compilation_write (object, unit)
    class(compilation_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u, i
    u = given_output_unit (unit)
    write (u, "(1x,A)") "Compilation object:"
    write (u, "(3x,3A)") "executable           = '", &
      char (object%exe_name), "'"
    write (u, "(3x,A)", advance="no") "process libraries ="

### 30.13.6 Test static build

The tests for building a static executable are separate, since they should be skipped if the WHIZARD build itself has static libraries disabled.

```

⟨Compilations: public test⟩+≡
public :: compilations_static_test

⟨Compilations: test driver⟩+≡
subroutine compilations_static_test (u, results)
integer, intent(in) :: u
type(test_results_t), intent(inout) :: results
⟨Compilations: static tests⟩
end subroutine compilations_static_test

```

### External Matrix Element

Compile an external test matrix element (omega type) and incorporate this in a new static WHIZARD executable.

```

⟨Compilations: static tests⟩≡
call test (compilations_static_1, "compilations_static_1", &
"static executable: compilation", &
u, results)

⟨Compilations: test declarations⟩+≡

```

### External Matrix Element

Compile an external test matrix element (`omega` type) and incorporate this in a new static WHIZARD executable. In this version, we use the wrapper `compile_executable` procedure.

```

<Compilations: static tests>+≡
    call test (compilations_static_2, "compilations_static_2", &
               "static executable: shortcut", &
               u, results)

<Compilations: test declarations>+≡
    public :: compilations_static_2

<Compilations: tests>+≡
    subroutine compilations_static_2 (u)
        integer, intent(in) :: u
        type(string_t) :: libname, procname, exename
        type(rt_data_t), target :: global
        logical :: exist
        integer :: u_file

        write (u, "(A)")  "* Test output: compilations_static_2"
        write (u, "(A)")  "* Purpose: make static executable"
        write (u, "(A)")

        write (u, "(A)")  "* Initialize library and compile"
        write (u, "(A)")

        call syntax_model_file_init ()

        call global%global_init ()
        call global%set_log (var_str ("?omega_openmp"), &
                           .false., is_known = .true.)

        libname = "compilations_static_2_lib"
        procname = "prc_comp_stat_2"
        exename = "compilations_static_2"

        call prepare_test_library (global, libname, 2, [procname,procname])

        call compile_executable (exename, [libname], global)

        write (u, "(A)")  "* Check executable (should be present)"
        write (u, "(A)")

        inquire (file = char (exename), exist = exist)
        write (u, "(A,A,L1)")  char (exename), " exists = ", exist

```

```
write (u, "(A)")
write (u, "(A)")  "* Cleanup"

u_file = free_unit ()
open (u_file, file = char (exename), status = "old", action = "write")
close (u_file, status = "delete")

⟨Integrations: procedures⟩

end module integrations

```

### 30.14.1 The integration type

This type holds all relevant data, the integration methods operates on this. In contrast to the `simulation_t` introduced later, the `integration_t` applies to a single process.

```

⟨Integrations: public⟩≡
    public :: integration_t

⟨Integrations: types⟩≡
    type :: integration_t
        private
        type(string_t) :: process_id
        type(string_t) :: run_id
        type(process_t), pointer :: process => null ()
        type(var_list_t), pointer :: model_vars => null ()
        type(qcd_t) :: qcd
        logical :: rebuild_phs = .false.
        logical :: ignore_phs_mismatch = .false.
        logical :: phs_only = .false.
        logical :: process_has_me = .true.
        integer :: n_calls_test = 0
        logical :: vis_history = .true.
        type(string_t) :: history_filename
        type(string_t) :: log_filename
        logical :: combined_integration = .false.
contains
    ⟨Integrations: integration: TBP⟩
end type integration_t

```

### 30.14.2 Initialization

Initialization, first part: Create a process entry. Push it on the stack if the `global` environment is supplied.

```

⟨Integrations: integration: TBP⟩≡
    procedure :: create_process => integration_create_process

⟨Integrations: procedures⟩≡
    subroutine integration_create_process (intg, process_id, global)
        class(integration_t), intent(out) :: intg
        type(rt_data_t), intent(inout), optional, target :: global
        type(string_t), intent(in) :: process_id
        type(process_entry_t), pointer :: process_entry
        intg%process_id = process_id

```

```

if (present (global)) then
    allocate (process_entry)
    intg%process => process_entry%process_t
    call global%process_stack%push (process_entry)
else
    allocate (process_t :: intg%process)
end if
intg%model_vars => null ()
end subroutine integration_create_process

```

Initialization, second part: Initialize the process object, using the local environment. We allocate a RNG factory and a QCD object. We also fetch a pointer to the model that the process uses. The process initializer will create a snapshot of that model.

This procedure does not modify the `local` stack directly. The intent(`inout`) attribute for the `local` data set is due to the random generator seed which may be incremented during initialization.

NOTE: Changes to model parameters within the current context are respected only if the process model coincides with the current model. This is the usual case. If not, we read the model from the global model library, which has default parameters. To become more flexible, we should implement a local model library which records local changes to currently inactive models.

```

<Integrations: integration: TBP>+≡
procedure :: init_process => integration_init_process
<Integrations: procedures>+≡
subroutine integration_init_process (intg, local)
    class(integration_t), intent(inout) :: intg
    type(rt_data_t), intent(inout), target :: local
    type(string_t) :: model_name
    type(model_t), pointer :: model
    class(model_data_t), pointer :: model_instance
    class(rng_factory_t), allocatable :: rng_factory
    if (.not. local%prclib%contains (intg%process_id)) then
        call msg_fatal ("Process '" // char (intg%process_id) // "' not found" &
                       // " in library '" // char (local%prclib%get_name ()) // "'")
        return
    end if
    intg%run_id = &
        local%var_list%get_sval (var_str ("$run_id"))
    call dispatch_qcd (intg%qcd, local)
    call dispatch_rng_factory (rng_factory, local)

### 30.14.3 Integration

Integrate: do the final integration. Here, we do a multi-iteration integration. Again, we skip iterations that are already on file. Record the results in the global variable list.

```

⟨Integrations: integration: TBP⟩+≡
procedure :: evaluate => integration_evaluate

⟨Integrations: procedures⟩+≡
subroutine integration_evaluate &
    (intg, process_instance, i_mci, pass, it_list, pacify)
class(integration_t), intent(inout) :: intg
type(process_instance_t), intent(inout), target :: process_instance
integer, intent(in) :: i_mci
integer, intent(in) :: pass

```

```

type(iterations_list_t), intent(in) :: it_list
logical, intent(in), optional :: pacify
integer :: n_calls, n_it
logical :: adapt_grids, adapt_weights, final

n_it = it_list%get_n_it (pass)
n_calls = it_list%get_n_calls (pass)
adapt_grids = it_list%adapt_grids (pass)
adapt_weights = it_list%adapt_weights (pass)
final = pass == it_list%get_n_pass ()

call intg%process%integrate (process_instance, &
    i_mci, n_it, n_calls, adapt_grids, adapt_weights, &
    final, pacify)

end subroutine integration_evaluate

```

In case the user has not provided a list of iterations, make a reasonable default. This can depend on the process. The usual approach is to define two distinct passes, one for adaptation and one for integration.

```

<Integrations: integration: TBP>+≡
procedure :: make_iterations_list => integration_make_iterations_list
<Integrations: procedures>+≡
subroutine integration_make_iterations_list (intg, it_list)
    class(integration_t), intent(in) :: intg
    type(iterations_list_t), intent(out) :: it_list
    integer :: pass, n_pass
    integer, dimension(:), allocatable :: n_it, n_calls
    logical, dimension(:), allocatable :: adapt_grids, adapt_weights
    n_pass = intg%process%get_n_pass_default ()
    allocate (n_it (n_pass), n_calls (n_pass))
    allocate (adapt_grids (n_pass), adapt_weights (n_pass))
    do pass = 1, n_pass
        n_it(pass)          = intg%process%get_n_it_default (pass)
        n_calls(pass)       = intg%process%get_n_calls_default (pass)
        adapt_grids(pass)   = intg%process%adapt_grids_default (pass)
        adapt_weights(pass) = intg%process%adapt_weights_default (pass)
    end do

        adapt_grids = adapt_grids, adapt_weights = adapt_weights)
end subroutine integration_make_iterations_list

```

### 30.14.4 API for integration objects

This initializer does everything except assigning cuts/scale/weight expressions.

```

<Integrations: integration: TBP>+≡
procedure :: init => integration_init
<Integrations: procedures>+≡
subroutine integration_init (intg, process_id, local, global, local_stack)
    class(integration_t), intent(out) :: intg

```

```

type(string_t), intent(in) :: process_id
type(rt_data_t), intent(inout), target :: local
type(rt_data_t), intent(inout), optional, target :: global
logical, intent(in), optional :: local_stack
logical :: use_local
use_local = .false.; if (present (local_stack)) use_local = local_stack
if (present (global)) then
    call intg%create_process (process_id, global)
else if (use_local) then
    call intg%create_process (process_id, local)
else
    call intg%create_process (process_id)
end if
call intg%init_process (local)
call intg%setup_process (local)
end subroutine integration_init

```

Do the integration for a single process, both warmup and final evaluation. The `eff_reset` flag is to suppress numerical noise in the graphical output of the integration history.

```

<Integrations: integration: TBP>+≡
procedure :: integrate => integration_integrate

        call process_instance%final ()
    end subroutine integration_sampler_test

```

Return the process pointer (needed by simulate):

```

⟨Integrations: integration: TBP⟩+≡
    procedure :: get_process_ptr => integration_get_process_ptr
⟨Integrations: procedures⟩+≡
    function integration_get_process_ptr (intg) result (ptr)

```

```

class(integration_t), intent(in) :: intg
type(process_t), pointer :: ptr
ptr => intg%process
end function integration_get_process_ptr

```

Simply integrate, do a dummy integration if necessary. The `integration` object exists only internally.

If the `global` environment is provided, the process object is appended to the global stack. Otherwise, if `local_stack` is set, we append to the local process stack. If this is unset, the `process` object is not recorded permanently.

The `init_only` flag can be used to skip the actual integration part. We will end up with a process object that is completely initialized, including phase space configuration.

The `eff_reset` flag is to suppress numerical noise in the visualization of the integration history.

```

<Integrations: public>+≡
    public :: integrate_process

<Integrations: procedures>+≡

```

### Integration of test process

Compile and integrate an intrinsic test matrix element (`prc_test` type). The phase-space implementation is `phs_single` (single-particle phase space), the integrator is `mci_midpoint`.

The cross section for the  $2 \rightarrow 2$  process  $ss \rightarrow ss$  with its constant matrix element is given by

$$\sigma = c \times f \times \Phi_2 \times |M|^2. \quad (30.1)$$

$c$  is the conversion constant

$$c = 0.3894 \times 10^{12} \text{ fb GeV}^2. \quad (30.2)$$

$f$  is the flux of the incoming particles with mass  $m = 125 \text{ GeV}$  and energy  $\sqrt{s} = 1000 \text{ GeV}$

$$f = \frac{(2\pi)^4}{2\lambda^{1/2}(s, m^2, m^2)} = \frac{(2\pi)^4}{2\sqrt{s}\sqrt{s-4m^2}} = 8.048 \times 10^{-4} \text{ GeV}^{-2} \quad (30.3)$$

$\Phi_2$  is the volume of the two-particle phase space

$$\Phi_2 = \frac{1}{4(2\pi)^5} = 2.5529 \times 10^{-5}. \quad (30.4)$$

The squared matrix element  $|M|^2$  is unity. Combining everything, we obtain

$$\sigma = 8000 \text{ fb} \quad (30.5)$$

This number should appear as the final result.

Note: In this and the following test, we reset the Fortran compiler and flag variables immediately before they are printed, so the test is portable.

```

### Structure functions

Compile and integrate an intrinsic test matrix element (`prc_test` type) using the default (`phs_wood`) phase-space implementation. The integration method is `vamp`. There is a structure function of type `unit_test`.

We use a test structure function  $f(x) = x$  for both beams. Together with the

$1/x_1x_2$  factor from the phase-space flux and a unit matrix element, we should get the same result as previously for the process without structure functions. There is a slight correction due to the  $m_s$  mass which we set to zero here.

```

⟨Integrations: execute tests⟩+≡
    call test (integrations_8, "integrations_8", &
               "integration with structure function", &

## 30.15 Event Streams

This module manages I/O from/to multiple concurrent event streams. Usually, there is at most one input stream, but several output streams. For the latter, we set up an array which can hold `eio_t` (event I/O) objects of different dynamic types simultaneously. One of them may be marked as an input channel.

```
<event_streams.f90>≡
<File header>

module event_streams

<Use strings>
use io_units
use diagnostics
use events
use eio_data
use eio_base
use rt_data

use dispatch, only: dispatch_eio

<Standard module head>

<Event streams: public>

<Event streams: types>

contains

<Event streams: procedures>

end module event_streams
```

### 30.15.1 Event Stream Array

Each entry is an `eio_t` object. Since the type is dynamic, we need a wrapper:

```
<Event streams: types>≡
type :: event_stream_entry_t
    class(eio_t), allocatable :: eio
end type event_stream_entry_t
```

An array of event-stream entry objects. If one of the entries is an input channel, `i_in` is the corresponding index.

```
<Event streams: public>≡
public :: event_stream_array_t

<Event streams: types>+≡
type :: event_stream_array_t
    type(event_stream_entry_t), dimension(:), allocatable :: entry
    integer :: i_in = 0
contains
<Event streams: event stream array: TBP>
end type event_stream_array_t
```

Output.

```
(Event streams: event stream array: TBP)≡
    procedure :: write => event_stream_array_write
(Event streams: procedures)≡
    subroutine event_stream_array_write (object, unit)
        class(event_stream_array_t), intent(in) :: object
        integer, intent(in), optional :: unit
        integer :: u, i
        u = given_output_unit (unit)
        write (u, "(1x,A)") "Event stream array:"
        if (allocated (object%entry)) then
            select case (size (object%entry))
            case (0)
                write (u, "(3x,A)") "[empty]"
            case default
                do i = 1, size (object%entry)
                    if (i == object%i_in) write (u, "(1x,A)") "Input stream:"
                    call object%entry(i)%eio%write (u)
                end do
            end select
        else
            write (u, "(3x,A)") "[undefined]"
        end if
    end subroutine event_stream_array_write
```

Finalize all streams.

```
(Event streams: event stream array: TBP)+≡
    procedure :: final => event_stream_array_final
(Event streams: procedures)+≡
    subroutine event_stream_array_final (es_array)
        class(event_stream_array_t), intent(inout) :: es_array
        integer :: i
        do i = 1, size (es_array%entry)
            call es_array%entry(i)%eio%final ()
        end do
    end subroutine event_stream_array_final
```

Initialization. We use a generic `sample` name, open event I/O objects for all provided stream types (using the `dispatch_eio` routine), and initialize for the given list of process pointers. If there is an `input` argument, this channel is initialized as an input channel and appended to the array.

The `input_data` or, if not present, `data` may be modified. This happens if we open a stream for reading and get new information there.

```
(Event streams: event stream array: TBP)+≡
    procedure :: init => event_stream_array_init
(Event streams: procedures)+≡
    subroutine event_stream_array_init &
        (es_array, sample, stream_fmt, global, &
         data, input, input_sample, input_data, allow_switch, checkpoint, &
```

```

    object%has_integral = .true.
  end if
end subroutine mci_set_init
```

### 30.16.3 Process-core Safe

This is an object that temporarily holds a process core object. We need this while rescanning a process with modified parameters. After the rescan, we want to restore the original state.

```
(Simulations: types)+≡
type :: core_safe_t
  class(prc_core_t), allocatable :: core
end type core_safe_t
```

### 30.16.4 Process Object

The simulation works on process objects. This subroutine makes a process object available for simulation. The process is in the process stack. If integration is not yet done, do it. Any generated process object should be put on the global stack, if it is separate from the local one.

```
(Simulations: procedures)+≡
subroutine prepare_process &
  (process, process_id, integrate, local, global)
  type(process_t), pointer, intent(out) :: process
  type(string_t), intent(in) :: process_id
  logical, intent(in) :: integrate
  type(rt_data_t), intent(inout), target :: local
```

```

type(rt_data_t), intent(inout), optional, target :: global
if (present (global)) then
    process => global%process_stack%get_process_ptr (process_id)
else
    process => local%process_stack%get_process_ptr (process_id)
end if
if (.not. associated (process)) then
    if (integrate) then
        call msg_message ("Simulate: process '" &
                          // char (process_id) // "' needs integration")
    else
        call msg_message ("Simulate: process '" &
                          // char (process_id) // "' needs initialization")
    end if
    if (present (global)) then
        call integrate_process (process_id, local, global, &
                               init_only = .not. integrate)
    else
        call integrate_process (process_id, local, local_stack=.true., &
                               init_only = .not. integrate)
    end if
    if (signal_is_pending ()) return
    process => global%process_stack%get_process_ptr (process_id)
    if (associated (process)) then
        if (integrate) then
            call msg_message ("Simulate: integration done")
            call global%process_stack%fill_result_vars (process_id)
        else
            call msg_message ("Simulate: process initialization done")
        end if
    else
        call msg_fatal ("Simulate: process '" &
                        // char (process_id) // "' could not be initialized: aborting")
    end if
end if
end subroutine prepare_process

```

### 30.16.5 Simulation entry

For each process that we consider for event generation, we need a separate entry. The entry separately records the process ID and run ID. The `weight_mci` array is used for selecting a component set (which shares a MCI record inside the process container) when generating an event for the current process.

The simulation entry is an extension of the `event_t` event record. This core object contains configuration data, pointers to the process and process instance, the expressions, flags and values that are evaluated at runtime, and the resulting particle set.

The entry explicitly allocate the `process_instance`, which becomes the process-specific workspace for the event record.

If entries with differing environments are present simultaneously, we may need to switch QCD parameters and/or the model event by event. In this case, the `qcd` and/or `model` components are present.

For the purpose of NLO events, `entry_t` contains a pointer list to other simulation-entries. This is due to the fact that we have to associate an event for each component of the fixed order simulation, i.e. one  $N$ -particle event and  $N_\alpha N + 1$ -particle events. However, all entries share the same event transforms.

```
<Simulations: types>+≡

Finalizer. The `instance` pointer component of the `event_t` base type points to a target which we did explicitly allocate in the `entry_init` procedure. Therefore, we finalize and explicitly deallocate it here. Then we call the finalizer of the base type.

```

```

Initialization. Search for a process entry and allocate a process instance as an anonymous object, temporarily accessible via the `process_instance` pointer. Assign data by looking at the process object and at the environment.

If `n_alt` is set, we prepare for additional alternate sqme and weight entries.

If the process object is not found initially: if `integrate` is set, attempt an integration pass and try again. Otherwise, just initialize the object.

If `generate` is set, prepare the MCI objects for generating new events. For pure rescanning, this is not necessary.

When done, we assign the `instance` and `process` pointers of the base type by the `connect` method, so we can reference them later.

### 30.16.6 Entries for alternative environment

Entries for alternate environments. [No additional components anymore, so somewhat redundant.]

```

⟨Simulations: types⟩+≡
    type, extends (entry_t) :: alt_entry_t
    contains
        ⟨Simulations: alt entry: TBP⟩
    end type alt_entry_t

```

The alternative entries are there to re-evaluate the event, given momenta, in a different context.

Therefore, we allocate a local process object and use this as the reference for the local process instance, when initializing the entry. We temporarily import the `process` object into an `integration_t` wrapper, to take advantage of the associated methods. The local process object is built in the context of the current environment, here called `global`. Then, we initialize the process instance.

The `master_process` object contains the integration results to which we refer when recalculating an event. Therefore, we use this object instead of the locally built `process` when we extract the integration results.

The locally built `process` object should be finalized when done. It remains accessible via the `event_t` base object of `entry`, which contains pointers to the process and instance.

```

### 30.16.7 The simulation type

Each simulation object corresponds to an event sample, identified by the `sample_id`.

The simulation may cover several processes simultaneously. All process-specific data, including the event records, are stored in the `entry` subobjects. The current index indicates which record was selected last. `version` is foreseen to contain a tag on the WHIZARD event file version. It can be

```

⟨Simulations: public⟩≡

Initialization. We can deduce all data from the given list of process IDs and the global data set. The process objects are taken from the stack. Once the individual integrals are known, we add them (and the errors), to get the sample integral.

If there are alternative environments, we suspend initialization for setting up alternative process objects, then restore the master process and its parameters. The generator or rescanner can then switch rapidly between processes.

If `integrate` is set, we make sure that all affected processes are integrated before simulation. This is necessary if we want to actually generate events. If `integrate` is unset, we don't need the integral because we just rescan existing events. In that case, we just need compiled matrix elements.

If `generate` is set, we prepare for actually generating events. Otherwise, we may only read and rescan events.

```

The number of events that we want to simulate is determined by the settings of `n_events`, `luminosity`, and `?unweighted`. For weighted events, we take `n_events` at face value as the number of matrix element calls. For unweighted events, if the process is a decay, `n_events` is the number of unweighted events. In these cases, the luminosity setting is ignored.

For unweighted events with a scattering process, we calculate the event number that corresponds to the luminosity, given the current value of the integral. We then compare this with `n_events` and choose the larger number.

Compute the checksum of the process set. We retrieve the MD5 sums of all processes. This depends only on the process definitions, while parameters are not considered. The configuration checksum is retrieved from the MCI records in the process objects and furthermore includes beams, parameters, integration results, etc., so matching the latter should guarantee identical physics.

Generate a predefined number of events. First select a process and a component set, then generate an event for that process and factorize the quantum state. The pair of random numbers can be used for factorization.

When generating events, we drop all configurations where the event is marked as incomplete. This happens if the event fails cuts. In fact, such events are dropped already by the sampler if unweighting is in effect, so this can happen only for weighted events. By setting a limit given by `sample_max_tries` (user parameter), we can avoid an endless loop.

NB: When reading from file, event transforms can't be applied because the process instance will not be complete. This should be fixed.

Compute the event matrix element and weight for all alternative environments, given the current event and selected process. We first copy the particle set, then temporarily update the process core with local parameters, recalculate everything, and restore the process core.

The event weight is obtained by rescaling the original event weight with the ratio of the new and old `sqme` values. (In particular, if the old value was zero, the weight will stay zero.)

Note: this may turn out to be inefficient because we always replace all parameters and recalculate everything, once for each event and environment. However, a more fine-grained control requires more code. In any case, while we may keep multiple process cores (which stay constant for a simulation run), we still have to update the external matrix element parameters event by event. The matrix element “object” is present only once.

Rescan an undefined number of events.

If `update_event` or `update_sqme` is set, we have to recalculate the event, starting from the particle set. If the latter is set, this includes the squared matrix element (i.e., the amplitude is evaluated). Otherwise, only kinematics and observables derived from it are recovered.

If any of the update flags is set, we will come up with separate `sqme_prc` and `weight_prc` values. (The latter is only distinct if `update_weight` is set.) Otherwise, we accept the reference values.

These routines take care of temporary parameter redefinitions that we want to take effect while recalculating the matrix elements. We extract the core(s) of the processes that we are simulating, apply the changes, and make sure that the changes are actually used. This is the duty of `dispatch_core_update`. When done, we restore the original versions using `dispatch_core_restore`.

end subroutine simulation_write_event_eio

```

Read an event from a generic `eio` event stream. The event stream element must specify the process within the sample (`i_prc`), the MC group for this process (`i_mci`), the selected term (`i_term`), the selected MC integration channel, and the particle set of the event.

We may encounter EOF, which we indicate by storing 0 for the process index `i_prc`. An I/O error will be reported, and we also abort reading.

```

⟨Simulations: simulation: TBP⟩+≡
generic :: read_event => read_event_eio
procedure :: read_event_eio => simulation_read_event_eio

```

```

⟨Simulations: procedures⟩+≡
    subroutine simulation_read_event_eio (object, eio)
        class(simulation_t), intent(inout) :: object
        class(eio_t), intent(inout) :: eio
        integer :: iostat, current
        call eio%input_i_prc (current, iostat)

            object%i_mci = object%entry(current)%get_i_mci ()
        end select
    end subroutine simulation_read_event_eio

```

### 30.16.9 Event Stream Array

Write an event using an array of event I/O streams. The process index must be selected, or the current index must be available.

```

⟨Simulations: simulation: TBP⟩+≡
    generic :: write_event => write_event_es_array
    procedure :: write_event_es_array => simulation_write_event_es_array

⟨Simulations: procedures⟩+≡
    subroutine simulation_write_event_es_array (object, es_array, passed)
        class(simulation_t), intent(in), target :: object
        class(event_stream_array_t), intent(inout) :: es_array
        logical, intent(in), optional :: passed
        integer :: i_prc, event_index
        integer :: i
        type(entry_t), pointer :: current_entry
        i_prc = object%i_prc
        if (i_prc > 0) then
            event_index = object%counter%total
            current_entry => object%entry(i_prc)%get_first ()
            do i = 1, current_entry%count_nlo_entries ()
                if (i > 1) current_entry => current_entry%get_next ()
                call es_array%output (current_entry%event_t, i_prc, &
                    event_index, passed = passed, pacify = object%pacify)
            end do
        else
            call msg_fatal ("Simulation: write event: no process selected")
        end if
    end subroutine simulation_write_event_es_array

```

Read an event using an array of event I/O streams. Reading is successful if there is an input stream within the array, and if a valid event can be read from that stream. If there is a stream, but EOF is passed when reading the first item, we switch the channel to output and return failure but no error message, such that new events can be appended to that stream.

```

⟨Simulations: simulation: TBP⟩+≡
    generic :: read_event => read_event_es_array
    procedure :: read_event_es_array => simulation_read_event_es_array

⟨Simulations: procedures⟩+≡
    subroutine simulation_read_event_es_array (object, es_array, enable_switch, &

# Chapter 31

## More Unit Tests

This chapter collects some procedures for testing that can't be provided at the point where the corresponding modules are defined, because they use other modules of a different level.

(We should move them back, collecting the high-level functionality in init/final hooks that we can set at runtime.)

### 31.1 Expression Testing

Expression objects are part of process and event objects, but the process and event object modules should not depend on the implementation of expressions. Here, we collect unit tests that depend on expression implementation.

```
(expr_tests_ut.f90)≡
  ⟨File header⟩
  module expr_tests_ut

    use unit_tests
    use expr_tests_uti

  ⟨Standard module head⟩

  ⟨Expr tests: public test⟩

  contains

    ⟨Expr tests: test driver⟩

  end module expr_tests_ut

(expr_tests_uti.f90)≡
  ⟨File header⟩

  module expr_tests_uti

    ⟨Use kinds⟩
    ⟨Use strings⟩
      use format_defs, only: FMT_12
      use format_utils, only: write_separator
```

```

⟨Expr tests: tests⟩

end module expr_tests_uti

```

### 31.1.1 Test

This is the master for calling self-test procedures.

```

⟨Expr tests: public test⟩≡
    public :: subevt_expr_test

⟨Expr tests: test driver⟩≡
    subroutine subevt_expr_test (u, results)
        integer, intent(in) :: u
        type(test_results_t), intent(inout) :: results
    ⟨Expr tests: execute tests⟩
end subroutine subevt_expr_test

```

### Parton-event expressions

```

⟨Expr tests: execute tests⟩≡

```

```

call test (subevt_expr_1, "subevt_expr_1", &
           "parton-event expressions", &
           u, results)

### Processes: scales and such

Initialize a process and process instance, choose a sampling point and fill the process instance, evaluating a given cut configuration.

We use the same trivial process as for the previous test. All momentum and state dependence is trivial, so we just test basic functionality.

```

⟨Expr tests: execute tests⟩+≡
    call test (processes_6, "processes_6", &
               "handle scales and weight (partonic event)", &
               u, results)

# Chapter 32

## Top Level

The top level consists of

**commands** Defines generic command-list and command objects, and all specific implementations. Each command type provides a specific functionality. Together with the modules that provide expressions and variables, this module defines the Sindarin language.

**whizard** This module interprets streams of various kind in terms of the command language. It also contains the unit-test feature. We also define the externally visible procedures here, for the WHIZARD as a library.

**main** The driver for WHIZARD as a stand-alone program. Contains the command-line interpreter.

**whizard.c.interface** Alternative top-level procedures, for use in the context of a C-compatible caller program.

## 32.1 Commands

This module defines the command language of the main input file.

### 32.1.1 The command type

The command type is a generic type that holds any command, compiled for execution.

Each command may come with its own local environment. The command list that determines this environment is allocated as `options`, if necessary. (It has to be allocated as a pointer because the type definition is recursive.) The local environment is available as a pointer which either points to the global environment, or is explicitly allocated and initialized.

```

⟨Commands: types⟩≡
type, abstract :: command_t
  type(parse_node_t), pointer :: pn => null ()
  class(command_t), pointer :: next => null ()
  type(parse_node_t), pointer :: pn_opt => null ()
  type(command_list_t), pointer :: options => null ()
  type(rt_data_t), pointer :: local => null ()
contains
⟨Commands: command: TBP⟩
end type command_t

```

Finalizer: If there is an option list, finalize the option list and deallocate. If not, the local environment is just a pointer.

```

⟨Commands: command: TBP⟩≡
procedure :: final => command_final
⟨Commands: procedures⟩≡
recursive subroutine command_final (cmd)
  class(command_t), intent(inout) :: cmd
  if (associated (cmd%options)) then
    call cmd%options%final ()
    deallocate (cmd%options)
    call cmd%local%local_final ()
    deallocate (cmd%local)
  else
    cmd%local => null ()
  end if

```

```
end subroutine command_final
```

Allocate a command with the appropriate concrete type. Store the parse node pointer in the command object, so we can reference to it when compiling.

*(Commands: procedures) +≡*

```
subroutine dispatch_command (command, pn)
    class(command_t), intent(inout), pointer :: command
    type(parse_node_t), intent(in), target :: pn

        call msg_bug ("Command not implemented")
    end select
    command%pn => pn
end subroutine dispatch_command

```

Output. We allow for indentation so we can display a command tree.

```

⟨Commands: command: TBP⟩+≡
    procedure (command_write), deferred :: write
⟨Commands: interfaces⟩≡
    abstract interface
        subroutine command_write (cmd, unit, indent)
            import
            class(command_t), intent(in) :: cmd
            integer, intent(in), optional :: unit, indent
        end subroutine command_write
    end interface

```

Compile a command. The command type is already fixed, so this is a deferred type-bound procedure.

```

⟨Commands: command: TBP⟩+≡
    procedure (command_compile), deferred :: compile
⟨Commands: interfaces⟩+≡
    abstract interface
        subroutine command_compile (cmd, global)
            import
            class(command_t), intent(inout) :: cmd
            type(rt_data_t), intent(inout), target :: global
        end subroutine command_compile
    end interface

```

Execute a command. This will use and/or modify the runtime data set. If the quit flag is set, the caller should terminate command execution.

```

⟨Commands: command: TBP⟩+≡
    procedure (command_execute), deferred :: execute
⟨Commands: interfaces⟩+≡
    abstract interface
        subroutine command_execute (cmd, global)
            import
            class(command_t), intent(inout) :: cmd
            type(rt_data_t), intent(inout), target :: global
        end subroutine command_execute
    end interface

```

### 32.1.2 Options

The options command list is allocated, initialized, and executed, if the command is associated with an option text in curly braces. If present, a separate local runtime data set `local` will be allocated and initialized; otherwise, `local` becomes a pointer to the global dataset.

For output, we indent the options list.

```
(Commands: command: TBP)+≡
procedure :: write_options => command_write_options

(Commands: procedures)+≡
recursive subroutine command_write_options (cmd, unit, indent)
  class(command_t), intent(in) :: cmd
  integer, intent(in), optional :: unit, indent
  integer :: ind
  ind = 1; if (present (indent)) ind = indent + 1
  if (associated (cmd%options)) call cmd%options%write (unit, ind)
end subroutine command_write_options
```

Compile the options list, if any. This implies initialization of the local environment. Should be done once the `pn_opt` node has been assigned (if applicable), but before the actual command compilation.

```
(Commands: command: TBP)+≡
procedure :: compile_options => command_compile_options

(Commands: procedures)+≡
recursive subroutine command_compile_options (cmd, global)
  class(command_t), intent(inout) :: cmd
  type(rt_data_t), intent(inout), target :: global
  if (associated (cmd%pn_opt)) then
    allocate (cmd%local)
    call cmd%local%local_init (global)
    call global%copy_globals (cmd%local)
    allocate (cmd%options)
    call cmd%options%compile (cmd%pn_opt, cmd%local)
    call global%restore_globals (cmd%local)
    call cmd%local%deactivate ()
  else
    cmd%local => global
  end if
end subroutine command_compile_options
```

Execute options. First prepare the local environment, then execute the command list.

```
(Commands: command: TBP)+≡
procedure :: execute_options => cmd_execute_options

(Commands: procedures)+≡
recursive subroutine cmd_execute_options (cmd, global)
  class(command_t), intent(inout) :: cmd
  type(rt_data_t), intent(inout), target :: global
  if (associated (cmd%options)) then
    call cmd%local%activate ()
    call cmd%options%execute (cmd%local)
```

```

    end if
end subroutine cmd_execute_options
```

This must be called after the parent command has been executed, to undo temporary modifications to the environment. Note that some modifications to `global` can become permanent.

```

⟨Commands: command: TBP⟩+≡
procedure :: reset_options => cmd_reset_options

⟨Commands: procedures⟩+≡
subroutine cmd_reset_options (cmd, global)
  class(command_t), intent(inout) :: cmd
  type(rt_data_t), intent(inout), target :: global
  if (associated (cmd%options)) then
    call cmd%local%deactivate (global)
  end if
end subroutine cmd_reset_options
```

### 32.1.3 Specific command types

#### Model configuration

The command declares a model, looks for the specified file and loads it.

```

⟨Commands: types⟩+≡
type, extends (command_t) :: cmd_model_t
  private
  type(string_t) :: name
contains
  ⟨Commands: cmd model: TBP⟩
end type cmd_model_t
```

#### Output

```

⟨Commands: cmd model: TBP⟩≡
procedure :: write => cmd_model_write

⟨Commands: procedures⟩+≡
subroutine cmd_model_write (cmd, unit, indent)
  class(cmd_model_t), intent(in) :: cmd
  integer, intent(in), optional :: unit, indent
  integer :: u
  u = given_output_unit (unit);  if (u < 0)  return
  call write_indent (u, indent)
  write (u, "(1x,A,1x,'"',A,'"'))  "model =", char (cmd%name)
end subroutine cmd_model_write
```

Compile. Get the model name and read the model from file, so it is readily available when the command list is executed.

Assign the model pointer in the `global` record, so it can be used for (read-only) variable lookup while compiling further commands.

```

⟨Commands: cmd model: TBP⟩+≡
procedure :: compile => cmd_model_compile
```

```

⟨Commands: procedures⟩+≡
    subroutine cmd_model_compile (cmd, global)
        class(cmd_model_t), intent(inout) :: cmd
        type(rt_data_t), intent(inout), target :: global
        type(parse_node_t), pointer :: pn_name
        type(model_t), pointer :: model
        pn_name => parse_node_get_sub_ptr (cmd%pn, 3)
        cmd%name = parse_node_get_string (pn_name)
        model => null ()
        if (associated (global%model)) then
            if (global%model%get_name () == cmd%name)  model => global%model
        end if
        if (.not. associated (model)) then

    end subroutine cmd_model_execute

```

## Library configuration

We configure a process library that should hold the subsequently defined processes. If the referenced library exists already, just make it the currently active one.

```

⟨Commands: types⟩+≡
    type, extends (command_t) :: cmd_library_t
        private
        type(string_t) :: name
        contains
            ⟨Commands: cmd library: TBP⟩
    end type cmd_library_t

```

Output.

```
(Commands: cmd library: TBP)≡
    procedure :: write => cmd_library_write
(Commands: procedures)+≡
    subroutine cmd_library_write (cmd, unit, indent)
        class(cmd_library_t), intent(in) :: cmd
        integer, intent(in), optional :: unit, indent
        integer :: u
        u = given_output_unit (unit)
        call write_indent (u, indent)
        write (u, "(1x,A,1x,'"',A,'"')") "library =", char (cmd%name)
    end subroutine cmd_library_write
```

Compile. Get the library name.

```
(Commands: cmd library: TBP)+≡
    procedure :: compile => cmd_library_compile
(Commands: procedures)+≡
    subroutine cmd_library_compile (cmd, global)
        class(cmd_library_t), intent(inout) :: cmd
        type(rt_data_t), intent(inout), target :: global
        type(parse_node_t), pointer :: pn_name
        pn_name => parse_node_get_sub_ptr (cmd%pn, 3)
        cmd%name = parse_node_get_string (pn_name)
    end subroutine cmd_library_compile
```

Execute: Initialize a new library and push it on the library stack (if it does not yet exist). Insert a pointer to the library into the global data record. Then, try to load the library unless the rebuild flag is set.

```
(Commands: cmd library: TBP)+≡
    procedure :: execute => cmd_library_execute
(Commands: procedures)+≡
    subroutine cmd_library_execute (cmd, global)
        class(cmd_library_t), intent(inout) :: cmd
        type(rt_data_t), intent(inout), target :: global
        type(prclib_entry_t), pointer :: lib_entry
        type(process_library_t), pointer :: lib
        logical :: rebuild_library
        lib => global%prclib_stack%get_library_ptr (cmd%name)
        rebuild_library = &
            global%var_list%get_lval (var_str ("?rebuild_library"))
        if (.not. (associated (lib))) then
            allocate (lib_entry)
            call lib_entry%init (cmd%name)
            lib => lib_entry%process_library_t
            call global%add_prclib (lib_entry)

        end if
        if (associated (lib) .and. .not. rebuild_library) then
            call lib%update_status (global%os_data)
```

```

    end if
end subroutine cmd_library_execute
```

## Process configuration

We define a process-configuration command as a specific type. The incoming and outgoing particles are given evaluation-trees which we transform to PDG-code arrays. For transferring to O'MEGA, they are reconverted to strings.

For the incoming particles, we store parse nodes individually. We do not yet resolve the outgoing state, so we store just a single parse node.

This also includes the choice of method for the corresponding process: `omega` for O'MEGA matrix elements as Fortran code, `ovm` for O'MEGA matrix elements as a bytecode virtual machine, `test` for special processes, `unit_test` for internal test matrix elements generated by WHIZARD, `template` and `template_unity` for test matrix elements generated by WHIZARD as Fortran code similar to the O'MEGA code. If the one-loop program (OLP) GoSam is linked, also matrix elements from there (at leading and next-to-leading order) can be generated via `gosam`.

```

⟨Commands: types⟩+≡
  type, extends (command_t) :: cmd_process_t
    private
    type(string_t) :: id
    integer :: n_in = 0
    type(parse_node_p), dimension(:), allocatable :: pn_pdg_in
    type(parse_node_t), pointer :: pn_out => null ()
    contains
    ⟨Commands: cmd process: TBP⟩
  end type cmd_process_t
```

Output. The particle expressions are not resolved, so we just list the number of incoming particles.

```

⟨Commands: cmd process: TBP⟩≡
  procedure :: write => cmd_process_write
⟨Commands: procedures⟩+≡
  subroutine cmd_process_write (cmd, unit, indent)
    class(cmd_process_t), intent(in) :: cmd
    integer, intent(in), optional :: unit, indent
    integer :: u
    u = given_output_unit (unit);  if (u < 0)  return
    call write_indent (u, indent)
    write (u, "(1x,A,A,I0,A)") "process: ", char (cmd%id), " (", &
      size (cmd%pn_pdg_in), " -> X)"
    call cmd%write_options (u, indent)
  end subroutine cmd_process_write
```

Compile. Find and assign the parse nodes.

```

⟨Commands: cmd process: TBP⟩+≡
  procedure :: compile => cmd_process_compile
```

```

⟨Commands: procedures⟩+≡
    subroutine cmd_process_compile (cmd, global)
        class(cmd_process_t), intent(inout) :: cmd
        type(rt_data_t), intent(inout), target :: global
        type(parse_node_t), pointer :: pn_id, pn_in, pn_codes
        integer :: i
        pn_id => parse_node_get_sub_ptr (cmd%pn, 2)
        pn_in => parse_node_get_next_ptr (pn_id, 2)
        cmd%pn_out => parse_node_get_next_ptr (pn_in, 2)
        cmd%pn_opt => parse_node_get_next_ptr (cmd%pn_out)
        call cmd%compile_options (global)
        cmd%id = parse_node_get_string (pn_id)
        cmd%n_in = parse_node_get_n_sub (pn_in)
        pn_codes => parse_node_get_sub_ptr (pn_in)
        allocate (cmd%pn_pdg_in (cmd%n_in))
        do i = 1, cmd%n_in
            cmd%pn_pdg_in(i)%ptr => pn_codes
            pn_codes => parse_node_get_next_ptr (pn_codes)
        end do
    end subroutine cmd_process_compile

```

Command execution. Evaluate the subevents, transform PDG codes into strings, and add the current process configuration to the process library.

The initial state will be unique (one or two particles). For the final state, we allow for expressions. The expressions will be expanded until we have a sum of final states. Each distinct final state will get its own process component.

To identify equivalent final states, we transform the final state into an array of PDG codes, which we sort and compare. If a particle entry is actually a PDG array, only the first entry in the array is used for the comparison. The user should make sure that there is no overlap between different particles or arrays which would make the expansion ambiguous.

```

Command execution. Generate code, write driver, compile and link. Do this for all libraries in the list.

If no library names have been given and stored while compiling this command, we collect all libraries from the current stack and compile those.

We can compile static libraries (which actually just loads them). However, we can't incorporate in a generated executable.

```
(Commands: cmd compile: TBP) +≡
procedure :: execute => cmd_compile_execute
(Commands: procedures) +≡
subroutine cmd_compile_execute (cmd, global)
  class(cmd_compile_t), intent(inout) :: cmd
  type(rt_data_t), intent(inout), target :: global
  type(string_t), dimension(:), allocatable :: libname, libname_static
  integer :: i
  if (allocated (cmd%libname)) then
    allocate (libname (size (cmd%libname)))
    libname = cmd%libname
  else
    call cmd%local%prclib_stack%get_names (libname)
  end if
  if (cmd%make_executable) then
    call get_prclib_static (libname_static)
    do i = 1, size (libname)
      if (any (libname_static == libname(i))) then
        call msg_fatal ("Compile: can't include static library '" &
                      // char (libname(i)) // "'")
      end if
    end do
    call compile_executable (cmd%exec_name, libname, cmd%local)
  else
    do i = 1, size (libname)
      call compile_library (libname(i), cmd%local)
    end do
  end if
end subroutine cmd_compile_execute
```

This is the interface to the external procedure which returns the names of all static libraries which are part of the executable. (The default is none.) The routine must allocate the array.

```
(Commands: public) ≡
public :: get_prclib_static
(Commands: interfaces) +≡
interface
  subroutine get_prclib_static (libname)
    import
    type(string_t), dimension(:), intent(inout), allocatable :: libname
  end subroutine get_prclib_static
end interface
```

        end if
    end if
end if
end subroutine cmd_exec_execute

```

### Variable declaration

A variable can have various types. Hold the definition as an eval tree.

There are intrinsic variables, user variables, and model variables. The latter are further divided in independent variables and dependent variables.

Regarding model variables: When dealing with them, we always look at two variable lists in parallel. The global (or local) variable list contains the user-visible values. It includes variables that correspond to variables in the current model's list. These, in turn, are pointers to the model's parameter list, so the model is always in sync, internally. To keep the global variable list in sync with the model, the global variables carry the `is_copy` property and contain a separate pointer to the model variable. (The pointer is reassigned whenever the model changes.) Modifying the global variable changes two values simultaneously: the visible value and the model variable, via this extra pointer. After each modification, we update dependent parameters in the model variable list and re-synchronize the global variable list (again, using these pointers) with the model variable this. In the last step, modifications in the derived parameters become visible.

When we integrate a process, we capture the current variable list of the current model in a separate model instance, which is stored in the process object. Thus, the model parameters associated to this process at this time are preserved for the lifetime of the process object.

When we generate or rescan events, we can again capture a local model variable list in a model instance. This allows us to reweight event by event with different parameter sets simultaneously.

*(Commands: types)*+≡

```

type, extends (command_t) :: cmd_var_t
    private
    type(string_t) :: name
    integer :: type = V_NONE
    type(parse_node_t), pointer :: pn_value => null ()
    logical :: is_intrinsic = .false.
    logical :: is_model_var = .false.
    contains
        <i>(Commands: cmd var: TBP)</i>
    end type cmd_var_t

```

Output. We know name, type, and properties, but not the value.

*(Commands: cmd var: TBP)*≡

```

procedure :: write => cmd_var_write

```

```

⟨Commands: procedures⟩+≡
    subroutine cmd_var_write (cmd, unit, indent)
        class(cmd_var_t), intent(in) :: cmd
        integer, intent(in), optional :: unit, indent
        integer :: u
        u = given_output_unit (unit);  if (u < 0)  return
        call write_indent (u, indent)
        write (u, "(1x,A,A,A)", advance="no")  "var: ", char (cmd%name), " (
        select case (cmd%type)
        case (V_NONE)
            write (u, "(A)", advance="no")  "[unknown]"
        case (V_LOG)
            write (u, "(A)", advance="no")  "logical"
        case (V_INT)
            write (u, "(A)", advance="no")  "int"
        case (V_REAL)
            write (u, "(A)", advance="no")  "real"
        case (V_CMPLX)
            write (u, "(A)", advance="no")  "complex"
        case (V_STR)
            write (u, "(A)", advance="no")  "string"
        case (V_PDG)
            write (u, "(A)", advance="no")  "alias"
        end select
        if (cmd%is_intrinsic) then
            write (u, "(A)", advance="no")  ", intrinsic"
        end if
        if (cmd%is_model_var) then
            write (u, "(A)", advance="no")  ", model"
        end if
        write (u, "(A)")  ")"
    end subroutine cmd_var_write

```

Compile the lhs and determine the variable name and type. Check whether this variable can be created or modified as requested, and append the value to the variable list, if appropriate. The value is initially undefined. The rhs is assigned to a pointer, to be compiled and evaluated when the command is executed.

```

## SLHA

Read a SLHA (SUSY Les Houches Accord) file to fill the appropriate model parameters. We do not access the current variable record, but directly work on the appropriate SUSY model, which is loaded if necessary.

We may be in read or write mode. In the latter case, we may write just input parameters, or the complete spectrum, or the spectrum with all decays.

```

⟨Commands: types⟩+≡
type, extends (command_t) :: cmd_slha_t
    private
    type(string_t) :: file
    logical :: write_mode = .false.
contains
⟨Commands: cmd slha: TBP⟩
end type cmd_slha_t

```

Output.

```

⟨Commands: cmd slha: TBP⟩≡

```

```

procedure :: write => cmd_slha_write
⟨Commands: procedures⟩+≡
    subroutine cmd_slha_write (cmd, unit, indent)
        class(cmd_slha_t), intent(in) :: cmd
        integer, intent(in), optional :: unit, indent
        integer :: u
        u = given_output_unit (unit); if (u < 0) return
        call write_indent (u, indent)
        write (u, "(1x,A,A)") "slha: file name = ", char (cmd%file)
        write (u, "(1x,A,L1)") "slha: write mode = ", cmd%write_mode
    end subroutine cmd_slha_write

```

Compile. Read the filename and store it.

```

⟨Commands: cmd slha: TBP⟩+≡
    procedure :: compile => cmd_slha_compile
⟨Commands: procedures⟩+≡
    subroutine cmd_slha_compile (cmd, global)
        class(cmd_slha_t), intent(inout) :: cmd
        type(rt_data_t), intent(inout), target :: global
        type(parse_node_t), pointer :: pn_key, pn_arg, pn_file
        pn_key => parse_node_get_sub_ptr (cmd%pn)
        pn_arg => parse_node_get_next_ptr (pn_key)
        pn_file => parse_node_get_sub_ptr (pn_arg)
        call cmd%compile_options (global)
        cmd%pn_opt => parse_node_get_next_ptr (pn_arg)
        select case (char (parse_node_get_key (pn_key)))

### Clear values

This command clears the current values of variables or other objects, where this makes sense. It parallels the `show` command. The objects are cleared, but not deleted.

*(Commands: types)*+≡

```

type, extends (command_t) :: cmd_clear_t
  private
    type(string_t), dimension(:), allocatable :: name
  contains
    <Commands: cmd clear: TBP>
end type cmd_clear_t

```

Output: list the names of the objects to be cleared.

```

<Commands: cmd clear: TBP>≡
  procedure :: write => cmd_clear_write
<Commands: procedures>+≡
  subroutine cmd_clear_write (cmd, unit, indent)
    class(cmd_clear_t), intent(in) :: cmd
    integer, intent(in), optional :: unit, indent
    integer :: u, i
    u = given_output_unit (unit);  if (u < 0)  return
    call write_indent (u, indent)
    write (u, "(1x,A)", advance="no")  "clear: "
    if (allocated (cmd%name)) then
      do i = 1, size (cmd%name)
        write (u, "(1x,A)", advance="no")  char (cmd%name(i))
      end do
      write (u, *)
    else
      write (u, "(5x,A)")  "[undefined]"
    end if
  end subroutine cmd_clear_write

```

Compile. Allocate an array which is filled with the names of the objects to be cleared.

Note: there is currently no need to account for options, but we prepare for that possibility.

```

<Commands: cmd clear: TBP>+≡

## Compare values of variables to expectation

The implementation is similar to the `show` command. There are just two arguments: two values that should be compared. For providing local values for the numerical tolerance, the command has a local argument list.

If the expectation fails, an error condition is recorded.

```
(Commands: types)+≡
  type, extends (command_t) :: cmd_expect_t
    private
      type(parse_node_t), pointer :: pn_expr => null ()
    contains
      (Commands: cmd expect: TBP)
  end type cmd_expect_t
```

Simply tell the status.

```
(Commands: cmd expect: TBP)+≡
  procedure :: write => cmd_expect_write
(Commands: procedures)+≡
  subroutine cmd_expect_write (cmd, unit, indent)
    class(cmd_expect_t), intent(in) :: cmd
    integer, intent(in), optional :: unit, indent
    integer :: u
    u = given_output_unit (unit);  if (u < 0)  return
    call write_indent (u, indent)
    if (associated (cmd%pn_expr)) then
      write (u, "(1x,A)") "expect: [expression associated]"
    else
      write (u, "(1x,A)") "expect: [undefined]"
    end if
  end subroutine cmd_expect_write
```

Compile. This merely assigns the parse node, the actual compilation is done at execution. This is necessary because the origin of variables (local/global) may change during execution.

```
(Commands: cmd expect: TBP)+≡
  procedure :: compile => cmd_expect_compile
(Commands: procedures)+≡
  subroutine cmd_expect_compile (cmd, global)
    class(cmd_expect_t), intent(inout) :: cmd
    type(rt_data_t), intent(inout), target :: global
    type(parse_node_t), pointer :: pn_arg
    pn_arg => parse_node_get_sub_ptr (cmd%pn, 2)
    cmd%pn_opt => parse_node_get_next_ptr (pn_arg)
    cmd%pn_expr => parse_node_get_sub_ptr (pn_arg)
    call cmd%compile_options (global)
  end subroutine cmd_expect_compile
```

Execute. Evaluate both arguments, print them and their difference (if numerical), and whether they agree. Record the result.

```
(Commands: cmd expect: TBP)+≡
  procedure :: execute => cmd_expect_execute
```

```

⟨Commands: procedures⟩+≡
    subroutine cmd_expect_execute (cmd, global)
        class(cmd_expect_t), intent(inout) :: cmd
        type(rt_data_t), intent(inout), target :: global
        type(var_list_t), pointer :: var_list
        logical :: success, is_known
        var_list => cmd%local%get_var_list_ptr ()
        success = eval_log (cmd%pn_leexpr, var_list, is_known=is_known)
        if (is_known) then
            if (success) then
                call msg_message ("expect: success")
            else
                call msg_error ("expect: failure")
            end if
        else
            call msg_error ("expect: undefined result")
            success = .false.
        end if
        call expect_record (success)
    end subroutine cmd_expect_execute

```

## Beams

The beam command includes both beam and structure-function definition.

```

⟨Commands: types⟩+≡
    type, extends (command_t) :: cmd_beams_t
        private
        integer :: n_in = 0
        type(parse_node_p), dimension(:), allocatable :: pn_pdg
        integer :: n_sf_record = 0
        integer, dimension(:), allocatable :: n_entry
        type(parse_node_p), dimension(:, :, :), allocatable :: pn_sf_entry
        contains
            ⟨Commands: cmd beams: TBP⟩
    end type cmd_beams_t

```

Output. The particle expressions are not resolved.

```

⟨Commands: cmd beams: TBP⟩≡
    procedure :: write => cmd_beams_write
⟨Commands: procedures⟩+≡
    subroutine cmd_beams_write (cmd, unit, indent)
        class(cmd_beams_t), intent(in) :: cmd
        integer, intent(in), optional :: unit, indent
        integer :: u

## Density matrices for beam polarization

For holding beam polarization, we define a notation and a data structure for sparse matrices. The entries (and the index expressions) are numerical expressions, so we use evaluation trees.

Each entry in the sparse matrix is an n-tuple of expressions. The first tuple elements represent index values, the last one is an arbitrary (complex) number. Absent expressions are replaced by default-value rules.

Note: Here, and in some other commands, we would like to store an evaluation tree, not just a parse node pointer. However, the current expression handler wants all variables defined, so the evaluation tree can only be built by `evaluate`, i.e., compiled just-in-time and evaluated immediately.

```
<Commands: types>+≡  
    type :: sentry_expr_t  
        type(parse_node_p), dimension(:), allocatable :: expr  
        contains  
            <Commands: sentry expr: TBP>  
    end type sentry_expr_t
```

Compile parse nodes into evaluation trees.

```
<Commands: sentry expr: TBP>≡  
    procedure :: compile => sentry_expr_compile  
<Commands: procedures>+≡  
    subroutine sentry_expr_compile (sentry, pn)  
        class(sentry_expr_t), intent(out) :: sentry  
        type(parse_node_t), intent(in), target :: pn

end subroutine cmd_beams_pol_fraction_execute

```

## Beam momentum

This is completely analogous to the previous command, hence we can use inheritance.

```

⟨Commands: types⟩+≡
type, extends (cmd_beams_pol_fraction_t) :: cmd_beams_momentum_t

```

```

contains
⟨Commands: cmd beams momentum: TBP⟩
end type cmd_beams_momentum_t

Output.

⟨Commands: cmd beams momentum: TBP⟩≡
procedure :: write => cmd_beams_momentum_write
⟨Commands: procedures⟩+≡
subroutine cmd_beams_momentum_write (cmd, unit, indent)
  class(cmd_beams_momentum_t), intent(in) :: cmd
  integer, intent(in), optional :: unit, indent
  integer :: u
  u = given_output_unit (unit); if (u < 0) return
  call write_indent (u, indent)
  select case (cmd%n_in)
  case (1)
    write (u, "(1x,A)") "beams momentum: 1 [decay]"
  case (2)
    write (u, "(1x,A)") "beams momentum: 2 [scattering]"
  case default
    write (u, "(1x,A)") "beams momentum: [undefined]"
  end select
end subroutine cmd_beams_momentum_write

```

Compile: inherited.

Command execution: Not inherited, but just the error string and the final command are changed.

```

⟨Commands: cmd beams momentum: TBP⟩+≡
procedure :: execute => cmd_beams_momentum_execute
⟨Commands: procedures⟩+≡
subroutine cmd_beams_momentum_execute (cmd, global)
  class(cmd_beams_momentum_t), intent(inout) :: cmd
  type(rt_data_t), intent(inout), target :: global
  type(var_list_t), pointer :: var_list
  real(default), dimension(:), allocatable :: p
  type(eval_tree_t) :: expr
  integer :: i
  var_list => global%get_var_list_ptr ()
  allocate (p (cmd%n_in))
  do i = 1, cmd%n_in
    call expr%init_expr (cmd%expr(i)%ptr, var_list)
    call expr%evaluate ()
    if (expr%is_known ()) then
      p(i) = expr%get_real ()
    else
      call msg_fatal ("beams momentum: undefined value")
    end if
    call expr%final ()
  end do
  call global%beam_structure%set_momentum (p)
end subroutine cmd_beams_momentum_execute

```

## Beam angles

Again, this is analogous. There are two angles, polar angle  $\theta$  and azimuthal angle  $\phi$ , which can be set independently for both beams.

```
(Commands: types) +≡
  type, extends (cmd_beams_pol_fraction_t) :: cmd_beams_theta_t
    contains
      (Commands: cmd beams theta: TBP)
  end type cmd_beams_theta_t

  type, extends (cmd_beams_pol_fraction_t) :: cmd_beams_phi_t
    contains
      (Commands: cmd beams phi: TBP)
  end type cmd_beams_phi_t
```

Output.

```
(Commands: cmd beams theta: TBP) ≡
  procedure :: write => cmd_beams_theta_write
(Commands: cmd beams phi: TBP) ≡
  procedure :: write => cmd_beams_phi_write
(Commands: procedures) +≡
  subroutine cmd_beams_theta_write (cmd, unit, indent)
    class(cmd_beams_theta_t), intent(in) :: cmd
    integer, intent(in), optional :: unit, indent
    integer :: u
    u = given_output_unit (unit);  if (u < 0)  return
    call write_indent (u, indent)
    select case (cmd%n_in)
    case (1)
      write (u, "(1x,A)")  "beams theta: 1 [decay]"
    case (2)
      write (u, "(1x,A)")  "beams theta: 2 [scattering]"
    case default
      write (u, "(1x,A)")  "beams theta: [undefined]"
    end select
  end subroutine cmd_beams_theta_write

  subroutine cmd_beams_phi_write (cmd, unit, indent)
    class(cmd_beams_phi_t), intent(in) :: cmd
    integer, intent(in), optional :: unit, indent
    integer :: u
    u = given_output_unit (unit);  if (u < 0)  return
    call write_indent (u, indent)
    select case (cmd%n_in)
    case (1)
      write (u, "(1x,A)")  "beams phi: 1 [decay]"
    case (2)
      write (u, "(1x,A)")  "beams phi: 2 [scattering]"
    case default
      write (u, "(1x,A)")  "beams phi: [undefined]"
    end select
  end subroutine cmd_beams_phi_write
```

Compile: inherited.

Command execution: Not inherited, but just the error string and the final command are changed.

```
(Commands: cmd beams theta: TBP)+≡
procedure :: execute => cmd_beams_theta_execute

(Commands: cmd beams phi: TBP)+≡
procedure :: execute => cmd_beams_phi_execute

(Commands: procedures)+≡
subroutine cmd_beams_theta_execute (cmd, global)
  class(cmd_beams_theta_t), intent(inout) :: cmd
  type(rt_data_t), intent(inout), target :: global
  type(var_list_t), pointer :: var_list
  real(default), dimension(:), allocatable :: theta
  type(eval_tree_t) :: expr
  integer :: i
  var_list => global%get_var_list_ptr ()
  allocate (theta (cmd%n_in))
  do i = 1, cmd%n_in
    call expr%init_expr (cmd%expr(i)%ptr, var_list)
    call expr%evaluate ()
    if (expr%is_known ()) then
      theta(i) = expr%get_real ()
    else
      call msg_fatal ("beams theta: undefined value")
    end if
    call expr%final ()
  end do
  call global%beam_structure%set_theta (theta)
end subroutine cmd_beams_theta_execute

subroutine cmd_beams_phi_execute (cmd, global)
  class(cmd_beams_phi_t), intent(inout) :: cmd
  type(rt_data_t), intent(inout), target :: global
  type(var_list_t), pointer :: var_list
  real(default), dimension(:), allocatable :: phi
  type(eval_tree_t) :: expr
  integer :: i
  var_list => global%get_var_list_ptr ()
  allocate (phi (cmd%n_in))
  do i = 1, cmd%n_in
    call expr%init_expr (cmd%expr(i)%ptr, var_list)
    call expr%evaluate ()
    if (expr%is_known ()) then
      phi(i) = expr%get_real ()
    else
      call msg_fatal ("beams phi: undefined value")
    end if
    call expr%final ()
  end do
  call global%beam_structure%set_phi (phi)
end subroutine cmd_beams_phi_execute
```

## Cuts

Define a cut expression. We store the parse tree for the right-hand side instead of compiling it. Compilation is deferred to the process environment where the cut expression is used.

```
(Commands: types)+≡
  type, extends (command_t) :: cmd_cuts_t
    private
      type(parse_node_t), pointer :: pn_expr => null ()
    contains
      (Commands: cmd cuts: TBP)
  end type cmd_cuts_t
```

Output. Do not print the parse tree, since this may get cluttered. Just a message that cuts have been defined.

```
(Commands: cmd cuts: TBP)≡
  procedure :: write => cmd_cuts_write
(Commands: procedures)+≡
  subroutine cmd_cuts_write (cmd, unit, indent)
    class(cmd_cuts_t), intent(in) :: cmd
    integer, intent(in), optional :: unit, indent
    integer :: u
    u = given_output_unit (unit);  if (u < 0)  return
    call write_indent (u, indent)
    write (u, "(1x,A)") "cuts: [defined]"
  end subroutine cmd_cuts_write
```

Compile. Simply store the parse (sub)tree.

```
(Commands: cmd cuts: TBP)+≡
  procedure :: compile => cmd_cuts_compile
(Commands: procedures)+≡
  subroutine cmd_cuts_compile (cmd, global)
    class(cmd_cuts_t), intent(inout) :: cmd
    type(rt_data_t), intent(inout), target :: global
    cmd%pn_expr => parse_node_get_sub_ptr (cmd%pn, 3)
  end subroutine cmd_cuts_compile
```

Instead of evaluating the cut expression, link the parse tree to the global data set, such that it is compiled and executed in the appropriate process context.

```
(Commands: cmd cuts: TBP)+≡
  procedure :: execute => cmd_cuts_execute
(Commands: procedures)+≡
  subroutine cmd_cuts_execute (cmd, global)
    class(cmd_cuts_t), intent(inout) :: cmd
    type(rt_data_t), intent(inout), target :: global
    global%pn%cuts_expr => cmd%pn_expr
  end subroutine cmd_cuts_execute
```

## General, Factorization and Renormalization Scales

Define a scale expression for either the renormalization or the factorization scale. We store the parse tree for the right-hand side instead of compiling it. Compilation is deferred to the process environment where the expression is used.

```
<Commands: types>+≡
    type, extends (command_t) :: cmd_scale_t
        private
        type(parse_node_t), pointer :: pn_expr => null ()
        contains
    <Commands: cmd scale: TBP>
end type cmd_scale_t

<Commands: types>+≡
    type, extends (command_t) :: cmd_fac_scale_t
        private
        type(parse_node_t), pointer :: pn_expr => null ()
        contains
    <Commands: cmd fac scale: TBP>
end type cmd_fac_scale_t

<Commands: types>+≡
    type, extends (command_t) :: cmd_ren_scale_t
        private
        type(parse_node_t), pointer :: pn_expr => null ()
        contains
    <Commands: cmd ren scale: TBP>
end type cmd_ren_scale_t
```

Output. Do not print the parse tree, since this may get cluttered. Just a message that scale, renormalization and factorization have been defined, respectively.

```
<Commands: cmd scale: TBP>≡
    procedure :: write => cmd_scale_write

<Commands: procedures>+≡
    subroutine cmd_scale_write (cmd, unit, indent)
        class(cmd_scale_t), intent(in) :: cmd
        integer, intent(in), optional :: unit, indent
        integer :: u
        u = given_output_unit (unit);  if (u < 0)  return
        call write_indent (u, indent)
        write (u, "(1x,A)") "scale: [defined]"
    end subroutine cmd_scale_write

<Commands: cmd fac scale: TBP>≡
    procedure :: write => cmd_fac_scale_write

<Commands: procedures>+≡
    subroutine cmd_fac_scale_write (cmd, unit, indent)
        class(cmd_fac_scale_t), intent(in) :: cmd
        integer, intent(in), optional :: unit, indent
        integer :: u
```

```

u = given_output_unit (unit);  if (u < 0)  return
call write_indent (u, indent)
write (u, "(1x,A)")  "factorization scale: [defined]"
end subroutine cmd_fac_scale_write

    end subroutine cmd_ren_scale_execute

```

## Weight

Define a weight expression. The weight is applied to a process to be integrated, event by event. We store the parse tree for the right-hand side instead of compiling it. Compilation is deferred to the process environment where the expression is used.

```

⟨Commands: types⟩+≡
    type, extends (command_t) :: cmd_weight_t
        private
        type(parse_node_t), pointer :: pn_expr => null ()
        contains
            ⟨Commands: cmd weight: TBP⟩
    end type cmd_weight_t

```

Output. Do not print the parse tree, since this may get cluttered. Just a message that scale, renormalization and factorization have been defined, respectively.

```

⟨Commands: cmd weight: TBP⟩≡
    procedure :: write => cmd_weight_write

⟨Commands: procedures⟩+≡
    subroutine cmd_weight_write (cmd, unit, indent)
        class(cmd_weight_t), intent(in) :: cmd
        integer, intent(in), optional :: unit, indent
        integer :: u
        u = given_output_unit (unit);  if (u < 0)  return

```

```

call write_indent (u, indent)
write (u, "(1x,A)")  "weight expression: [defined]"
end subroutine cmd_weight_write

```

Compile. Simply store the parse (sub)tree.

```

⟨Commands: cmd weight: TBP⟩+≡
procedure :: compile => cmd_weight_compile
⟨Commands: procedures⟩+≡
subroutine cmd_weight_compile (cmd, global)
  class(cmd_weight_t), intent(inout) :: cmd
  type(rt_data_t), intent(inout), target :: global
  cmd%pn_expr => parse_node_get_sub_ptr (cmd%pn, 3)
end subroutine cmd_weight_compile

```

Instead of evaluating the expression, link the parse tree to the global data set, such that it is compiled and executed in the appropriate process context.

```

⟨Commands: cmd weight: TBP⟩+≡
procedure :: execute => cmd_weight_execute
⟨Commands: procedures⟩+≡
subroutine cmd_weight_execute (cmd, global)
  class(cmd_weight_t), intent(inout) :: cmd
  type(rt_data_t), intent(inout), target :: global
  global%pn%weight_expr => cmd%pn_expr
end subroutine cmd_weight_execute

```

## Selection

Define a selection expression. This is to be applied upon simulation or event-file rescanning, event by event. We store the parse tree for the right-hand side instead of compiling it. Compilation is deferred to the environment where the expression is used.

```

⟨Commands: types⟩+≡
type, extends (command_t) :: cmd_selection_t
  private
  type(parse_node_t), pointer :: pn_expr => null ()
contains
⟨Commands: cmd selection: TBP⟩
end type cmd_selection_t

```

Output. Do not print the parse tree, since this may get cluttered. Just a message that scale, renormalization and factorization have been defined, respectively.

```

⟨Commands: cmd selection: TBP⟩≡
procedure :: write => cmd_selection_write
⟨Commands: procedures⟩+≡
subroutine cmd_selection_write (cmd, unit, indent)
  class(cmd_selection_t), intent(in) :: cmd
  integer, intent(in), optional :: unit, indent
  integer :: u

```

```

u = given_output_unit (unit);  if (u < 0)  return
call write_indent (u, indent)
write (u, "(1x,A)")  "selection expression: [defined]"
end subroutine cmd_selection_write

```

Compile. Simply store the parse (sub)tree.

```

⟨Commands: cmd selection: TBP⟩+≡
procedure :: compile => cmd_selection_compile
⟨Commands: procedures⟩+≡
subroutine cmd_selection_compile (cmd, global)
  class(cmd_selection_t), intent(inout) :: cmd
  type(rt_data_t), intent(inout), target :: global
  cmd%pn_expr => parse_node_get_sub_ptr (cmd%pn, 3)
end subroutine cmd_selection_compile

```

Instead of evaluating the expression, link the parse tree to the global data set, such that it is compiled and executed in the appropriate process context.

```

⟨Commands: cmd selection: TBP⟩+≡
procedure :: execute => cmd_selection_execute
⟨Commands: procedures⟩+≡
subroutine cmd_selection_execute (cmd, global)
  class(cmd_selection_t), intent(inout) :: cmd
  type(rt_data_t), intent(inout), target :: global
  global%pn%selection_lexpr => cmd%pn_expr
end subroutine cmd_selection_execute

```

## Reweighting

Define a reweight expression. This is to be applied upon simulation or event-file rescanning, event by event. We store the parse tree for the right-hand side instead of compiling it. Compilation is deferred to the environment where the expression is used.

```

⟨Commands: types⟩+≡
type, extends (command_t) :: cmd_reweight_t
  private
  type(parse_node_t), pointer :: pn_expr => null ()
contains
  ⟨Commands: cmd reweight: TBP⟩
end type cmd_reweight_t

```

Output. Do not print the parse tree, since this may get cluttered. Just a message that scale, renormalization and factorization have been defined, respectively.

```

⟨Commands: cmd reweight: TBP⟩≡
procedure :: write => cmd_reweight_write
⟨Commands: procedures⟩+≡
subroutine cmd_reweight_write (cmd, unit, indent)
  class(cmd_reweight_t), intent(in) :: cmd
  integer, intent(in), optional :: unit, indent

```

```

integer :: u
u = given_output_unit (unit);  if (u < 0)  return
call write_indent (u, indent)
write (u, "(1x,A)")  "reweight expression: [defined]"
end subroutine cmd_reweight_write

```

Compile. Simply store the parse (sub)tree.

```

⟨Commands: cmd reweight: TBP⟩+≡
procedure :: compile => cmd_reweight_compile
⟨Commands: procedures⟩+≡
subroutine cmd_reweight_compile (cmd, global)
  class(cmd_reweight_t), intent(inout) :: cmd
  type(rt_data_t), intent(inout), target :: global
  cmd%pn_expr => parse_node_get_sub_ptr (cmd%pn, 3)
end subroutine cmd_reweight_compile

```

Instead of evaluating the expression, link the parse tree to the global data set, such that it is compiled and executed in the appropriate process context.

```

⟨Commands: cmd reweight: TBP⟩+≡
procedure :: execute => cmd_reweight_execute
⟨Commands: procedures⟩+≡
subroutine cmd_reweight_execute (cmd, global)
  class(cmd_reweight_t), intent(inout) :: cmd
  type(rt_data_t), intent(inout), target :: global
  global%pn%reweight_expr => cmd%pn_expr
end subroutine cmd_reweight_execute

```

## Alternative Simulation Setups

Together with simulation, we can re-evaluate event weights in the context of alternative setups. The `cmd_alt_setup_t` object is designed to hold these setups, which are brace-enclosed command lists. Compilation is deferred to the simulation environment where the setup expression is used.

```

⟨Commands: types⟩+≡
type, extends (command_t) :: cmd_alt_setup_t
  private
  type(parse_node_p), dimension(:), allocatable :: setup
contains
⟨Commands: cmd alt setup: TBP⟩
end type cmd_alt_setup_t

```

Output. Print just a message that the alternative setup list has been defined.

```

⟨Commands: cmd alt setup: TBP⟩≡
procedure :: write => cmd_alt_setup_write
⟨Commands: procedures⟩+≡
subroutine cmd_alt_setup_write (cmd, unit, indent)
  class(cmd_alt_setup_t), intent(in) :: cmd
  integer, intent(in), optional :: unit, indent
  integer :: u

```

```

u = given_output_unit (unit);  if (u < 0)  return
call write_indent (u, indent)
write (u, "(1x,A,I0,A)")  "alt_setup: ", size (cmd%setup), " entries"
end subroutine cmd_alt_setup_write

```

Compile. Store the parse sub-trees in an array.

```

⟨Commands: cmd alt setup: TBP⟩+≡
procedure :: compile => cmd_alt_setup_compile
⟨Commands: procedures⟩+≡
subroutine cmd_alt_setup_compile (cmd, global)
  class(cmd_alt_setup_t), intent(inout) :: cmd
  type(rt_data_t), intent(inout), target :: global
  type(parse_node_t), pointer :: pn_list, pn_setup
  integer :: i
  pn_list => parse_node_get_sub_ptr (cmd%pn, 3)
  if (associated (pn_list)) then
    allocate (cmd%setup (parse_node_get_n_sub (pn_list)))
    i = 1
    pn_setup => parse_node_get_sub_ptr (pn_list)
    do while (associated (pn_setup))
      cmd%setup(i)%ptr => pn_setup
      i = i + 1
      pn_setup => parse_node_get_next_ptr (pn_setup)
    end do
  else
    allocate (cmd%setup (0))
  end if
end subroutine cmd_alt_setup_compile

```

Execute. Transfer the array of command lists to the global environment.

```

⟨Commands: cmd alt setup: TBP⟩+≡
procedure :: execute => cmd_alt_setup_execute
⟨Commands: procedures⟩+≡
subroutine cmd_alt_setup_execute (cmd, global)
  class(cmd_alt_setup_t), intent(inout) :: cmd
  type(rt_data_t), intent(inout), target :: global
  if (allocated (global%pn%alt_setup))  deallocate (global%pn%alt_setup)
  allocate (global%pn%alt_setup (size (cmd%setup)), source = cmd%setup)
end subroutine cmd_alt_setup_execute

```

## Integration

Integrate several processes, consecutively with identical parameters.

```

⟨Commands: types⟩+≡
type, extends (command_t) :: cmd_integrate_t
  private
  integer :: n_proc = 0
  type(string_t), dimension(:), allocatable :: process_id
contains
⟨Commands: cmd integrate: TBP⟩

```

```

end type cmd_integrate_t

Output: we know the process IDs.

⟨Commands: cmd integrate: TBP⟩≡
procedure :: write => cmd_integrate_write
⟨Commands: procedures⟩+≡
subroutine cmd_integrate_write (cmd, unit, indent)
  class(cmd_integrate_t), intent(in) :: cmd
  integer, intent(in), optional :: unit, indent
  integer :: u, i
  u = given_output_unit (unit); if (u < 0) return
  call write_indent (u, indent)
  write (u, "(1x,A)", advance="no") "integrate "
  do i = 1, cmd%n_proc
    if (i > 1) write (u, "(A,1x)", advance="no") ","
    write (u, "(A)", advance="no") char (cmd%process_id(i))
  end do
  write (u, "(A)") ""
end subroutine cmd_integrate_write

```

Compile.

```

⟨Commands: cmd integrate: TBP⟩+≡
procedure :: compile => cmd_integrate_compile
⟨Commands: procedures⟩+≡
subroutine cmd_integrate_compile (cmd, global)
  class(cmd_integrate_t), intent(inout) :: cmd
  type(rt_data_t), intent(inout), target :: global
  type(parse_node_t), pointer :: pn_proclist, pn_proc
  integer :: i
  pn_proclist => parse_node_get_sub_ptr (cmd%pn, 2)
  cmd%pn_opt => parse_node_get_next_ptr (pn_proclist)
  call cmd%compile_options (global)
  cmd%n_proc = parse_node_get_n_sub (pn_proclist)
  allocate (cmd%process_id (cmd%n_proc))
  pn_proc => parse_node_get_sub_ptr (pn_proclist)
  do i = 1, cmd%n_proc
    cmd%process_id(i) = parse_node_get_string (pn_proc)
    call global%process_stack%init_result_vars (cmd%process_id(i))
    pn_proc => parse_node_get_next_ptr (pn_proc)
  end do
end subroutine cmd_integrate_compile

```

Command execution. Integrate the process(es) with the predefined number of passes, iterations and calls. For structure functions, cuts, weight and scale, use local definitions if present; by default, the local definitions are initialized with the global ones.

The `integrate` procedure should take its input from the currently active local environment, but produce a process record in the stack of the global environment.

Since the process acquires a snapshot of the variable list, so if the global list (or the local one) is deleted, this does no harm. This implies that later changes of the variable list do not affect the stored process.

```
(Commands: cmd integrate: TBP)+≡
procedure :: execute => cmd_integrate_execute

(Commands: procedures)+≡
subroutine cmd_integrate_execute (cmd, global)
  class(cmd_integrate_t), intent(inout) :: cmd
  type(rt_data_t), intent(inout), target :: global
  integer :: i
  do i = 1, cmd%n_proc
    call integrate_process (cmd%process_id(i), cmd%local, global)
    call global%process_stack%fill_result_vars (cmd%process_id(i))
    if (signal_is_pending ()) return
  end do
end subroutine cmd_integrate_execute
```

## Observables

Declare an observable. After the declaration, it can be used to record data, and at the end one can retrieve average and error.

```
(Commands: types)+≡
type, extends (command_t) :: cmd_observable_t
  private
  type(string_t) :: id
contains
(Commands: cmd observable: TBP)
end type cmd_observable_t
```

Output. We know the ID.

```
(Commands: cmd observable: TBP)≡
procedure :: write => cmd_observable_write

(Commands: procedures)+≡
subroutine cmd_observable_write (cmd, unit, indent)
  class(cmd_observable_t), intent(in) :: cmd
  integer, intent(in), optional :: unit, indent
  integer :: u
  u = given_output_unit (unit); if (u < 0) return
  call write_indent (u, indent)
  write (u, "(1x,A,A)") "observable: ", char (cmd%id)
end subroutine cmd_observable_write
```

Compile. Just record the observable ID.

```
(Commands: cmd observable: TBP)+≡
procedure :: compile => cmd_observable_compile

(Commands: procedures)+≡
subroutine cmd_observable_compile (cmd, global)
  class(cmd_observable_t), intent(inout) :: cmd
  type(rt_data_t), intent(inout), target :: global
```

```

type(parse_node_t), pointer :: pn_tag
pn_tag => parse_node_get_sub_ptr (cmd%pn, 2)
if (associated (pn_tag)) then
    cmd%pn_opt => parse_node_get_next_ptr (pn_tag)
end if
call cmd%compile_options (global)
select case (char (parse_node_get_rule_key (pn_tag)))
case ("analysis_id")
    cmd%id = parse_node_get_string (pn_tag)
case default
    call msg_bug ("observable: name expression not implemented (yet)")
end select
end subroutine cmd_observable_compile

```

Command execution. This declares the observable and allocates it in the analysis store.

```

⟨Commands: cmd observable: TBP⟩+≡
procedure :: execute => cmd_observable_execute
⟨Commands: procedures⟩+≡
subroutine cmd_observable_execute (cmd, global)
    class(cmd_observable_t), intent(inout) :: cmd
    type(rt_data_t), intent(inout), target :: global

    end if
end subroutine set_drawing_options

```

## Plots

Declare a plot. No mandatory arguments, just options.

```

⟨Commands: types⟩+≡
  type, extends (command_t) :: cmd_plot_t
    private
      type(string_t) :: id
    contains
      ⟨Commands: cmd plot: TBP⟩
  end type cmd_plot_t

```

Output. Just print the ID.

```

⟨Commands: cmd plot: TBP⟩≡
  procedure :: write => cmd_plot_write
⟨Commands: procedures⟩+≡
  subroutine cmd_plot_write (cmd, unit, indent)
    class(cmd_plot_t), intent(in) :: cmd
    integer, intent(in), optional :: unit, indent
    integer :: u
    u = given_output_unit (unit);  if (u < 0)  return
    call write_indent (u, indent)
    write (u, "(1x,A,A)") "plot: ", char (cmd%id)
  end subroutine cmd_plot_write

```

Compile. Record the plot ID and initialize lower, upper bound and bin width.

```

⟨Commands: cmd plot: TBP⟩+≡
  procedure :: compile => cmd_plot_compile
⟨Commands: procedures⟩+≡
  subroutine cmd_plot_compile (cmd, global)
    class(cmd_plot_t), intent(inout) :: cmd
    type(rt_data_t), intent(inout), target :: global
    type(parse_node_t), pointer :: pn_tag
    pn_tag => parse_node_get_sub_ptr (cmd%pn, 2)
    cmd%pn_opt => parse_node_get_next_ptr (pn_tag)
    call cmd%init (pn_tag, global)
  end subroutine cmd_plot_compile

```

This init routine is separated because it is reused below for graph initialization.

```

⟨Commands: cmd plot: TBP⟩+≡
  procedure :: init => cmd_plot_init

```

```

⟨Commands: procedures⟩+≡
  subroutine cmd_plot_init (plot, pn_tag, global)
    class(cmd_plot_t), intent(inout) :: plot
    type(parse_node_t), intent(in), pointer :: pn_tag
    type(rt_data_t), intent(inout), target :: global
    call plot%compile_options (global)
    select case (char (parse_node_get_rule_key (pn_tag)))
    case ("analysis_id")
      plot%id = parse_node_get_string (pn_tag)
    case default
      call msg_bug ("plot: name expression not implemented (yet)")
    end select
  end subroutine cmd_plot_init

```

Command execution. This declares the plot and allocates it in the analysis store.

```

⟨Commands: cmd plot: TBP⟩+≡
  procedure :: execute => cmd_plot_execute
⟨Commands: procedures⟩+≡
  subroutine cmd_plot_execute (cmd, global)
    class(cmd_plot_t), intent(inout) :: cmd
    type(rt_data_t), intent(inout), target :: global
    type(var_list_t), pointer :: var_list
    type(graph_options_t) :: graph_options
    type(drawing_options_t) :: drawing_options

    var_list => cmd%local%get_var_list_ptr ()
    call graph_options_init (graph_options)
    call set_graph_options (graph_options, var_list)
    call drawing_options_init_plot (drawing_options)
    call set_drawing_options (drawing_options, var_list)

    call analysis_init_plot (cmd%id, graph_options, drawing_options)
  end subroutine cmd_plot_execute

```

## Graphs

Declare a graph. The graph is defined in terms of its contents. Both the graph and its contents may carry options.

The graph object contains its own ID as well as the IDs of its elements. For the elements, we reuse the `cmd_plot_t` defined above.

```

⟨Commands: types⟩+≡
  type, extends (command_t) :: cmd_graph_t
    private
    type(string_t) :: id
    integer :: n_elements = 0
    type(cmd_plot_t), dimension(:), allocatable :: el
    type(string_t), dimension(:), allocatable :: element_id
  contains
  ⟨Commands: cmd graph: TBP⟩
end type cmd_graph_t

```

Output. Just print the ID.

```
(Commands: cmd graph: TBP)≡
procedure :: write => cmd_graph_write
(Commands: procedures)+≡
subroutine cmd_graph_write (cmd, unit, indent)
  class(cmd_graph_t), intent(in) :: cmd
  integer, intent(in), optional :: unit, indent
  integer :: u
  u = given_output_unit (unit);  if (u < 0)  return
  call write_indent (u, indent)
  write (u, "(1x,A,A,A,I0,A)") "graph: ", char (cmd%id), &
    " (", cmd%n_elements, " entries)"
end subroutine cmd_graph_write
```

Compile. Record the graph ID and initialize lower, upper bound and bin width. For compiling the graph element syntax, we use part of the `cmd_plot_t` compiler.

Note: currently, we do not respect options, therefore just IDs on the RHS.

```
(Commands: cmd graph: TBP)+≡
procedure :: compile => cmd_graph_compile
(Commands: procedures)+≡
subroutine cmd_graph_compile (cmd, global)
  class(cmd_graph_t), intent(inout) :: cmd
  type(rt_data_t), intent(inout), target :: global
  type(parse_node_t), pointer :: pn_term, pn_tag, pn_def, pn_app
  integer :: i

  pn_term => parse_node_get_sub_ptr (cmd%pn, 2)
  pn_tag => parse_node_get_sub_ptr (pn_term)
  cmd%pn_opt => parse_node_get_next_ptr (pn_tag)
  call cmd%compile_options (global)
  select case (char (parse_node_get_rule_key (pn_tag)))
  case ("analysis_id")
    cmd%id = parse_node_get_string (pn_tag)
  case default
    call msg_bug ("graph: name expression not implemented (yet)")
  end select
  pn_def => parse_node_get_next_ptr (pn_term, 2)
  cmd%n_elements = parse_node_get_n_sub (pn_def)
  allocate (cmd%element_id (cmd%n_elements))
  allocate (cmd%el (cmd%n_elements))
  pn_term => parse_node_get_sub_ptr (pn_def)
  pn_tag => parse_node_get_sub_ptr (pn_term)
  cmd%el(1)%pn_opt => parse_node_get_next_ptr (pn_tag)
  call cmd%el(1)%init (pn_tag, global)
  cmd%element_id(1) = parse_node_get_string (pn_tag)
  pn_app => parse_node_get_next_ptr (pn_term)
  do i = 2, cmd%n_elements
    pn_term => parse_node_get_sub_ptr (pn_app, 2)
    pn_tag => parse_node_get_sub_ptr (pn_term)
    cmd%el(i)%pn_opt => parse_node_get_next_ptr (pn_tag)
```

```

    call cmd%el(i)%init (pn_tag, global)
    cmd%element_id(i) = parse_node_get_string (pn_tag)
    pn_app => parse_node_get_next_ptr (pn_app)
end do

end subroutine cmd_graph_compile

```

Command execution. This declares the graph, allocates it in the analysis store, and copies the graph elements.

For the graph, we set graph and default drawing options. For the elements, we reset individual drawing options.

This accesses internals of the contained elements of type `cmd_plot_t`, see above. We might disentangle such an interdependency when this code is rewritten using proper type extension.

```

⟨Commands: cmd graph: TBP⟩+≡
procedure :: execute => cmd_graph_execute
⟨Commands: procedures⟩+≡
subroutine cmd_graph_execute (cmd, global)
  class(cmd_graph_t), intent(inout) :: cmd
  type(rt_data_t), intent(inout), target :: global
  type(var_list_t), pointer :: var_list
  type(graph_options_t) :: graph_options
  type(drawing_options_t) :: drawing_options
  integer :: i, type

  var_list => cmd%local%get_var_list_ptr ()
  call graph_options_init (graph_options)
  call set_graph_options (graph_options, var_list)
  call analysis_init_graph (cmd%id, cmd%n_elements, graph_options)

  do i = 1, cmd%n_elements
    if (associated (cmd%el(i)%options)) then
      call cmd%el(i)%options%execute (cmd%el(i)%local)
    end if
    type = analysis_store_get_object_type (cmd%element_id(i))
    select case (type)
    case (AN_HISTOGRAM)
      call drawing_options_init_histogram (drawing_options)
    case (AN_PLOT)
      call drawing_options_init_plot (drawing_options)
    end select
    call set_drawing_options (drawing_options, var_list)
    if (associated (cmd%el(i)%options)) then
      call set_drawing_options (drawing_options, cmd%el(i)%local%var_list)
    end if
    call analysis_fill_graph (cmd%id, i, cmd%element_id(i), drawing_options)
  end do
end subroutine cmd_graph_execute

```

## Analysis

Hold the analysis ID either as a string or as an expression:

```
(Commands: types)+≡
  type :: analysis_id_t
    type(string_t) :: tag
    type(parse_node_t), pointer :: pn_sexpr => null ()
  end type analysis_id_t
```

Define the analysis expression. We store the parse tree for the right-hand side instead of compiling it. Compilation is deferred to the process environment where the analysis expression is used.

```
(Commands: types)+≡
  type, extends (command_t) :: cmd_analysis_t
    private
      type(parse_node_t), pointer :: pn_leexpr => null ()
    contains
      (Commands: cmd analysis: TBP)
  end type cmd_analysis_t
```

Output. Print just a message that analysis has been defined.

```
(Commands: cmd analysis: TBP)≡
  procedure :: write => cmd_analysis_write

(Commands: procedures)+≡
  subroutine cmd_analysis_write (cmd, unit, indent)
    class(cmd_analysis_t), intent(in) :: cmd
    integer, intent(in), optional :: unit, indent
    integer :: u
    u = given_output_unit (unit);  if (u < 0)  return
    call write_indent (u, indent)
    write (u, "(1x,A)") "analysis: [defined]"
  end subroutine cmd_analysis_write
```

Compile. Simply store the parse (sub)tree.

```
(Commands: cmd analysis: TBP)+≡
  procedure :: compile => cmd_analysis_compile

(Commands: procedures)+≡
  subroutine cmd_analysis_compile (cmd, global)
    class(cmd_analysis_t), intent(inout) :: cmd
    type(rt_data_t), intent(inout), target :: global
    cmd%pn_leexpr => parse_node_get_sub_ptr (cmd%pn, 3)
  end subroutine cmd_analysis_compile
```

Instead of evaluating the cut expression, link the parse tree to the global data set, such that it is compiled and executed in the appropriate process context.

```
(Commands: cmd analysis: TBP)+≡
  procedure :: execute => cmd_analysis_execute
```

```

⟨Commands: procedures⟩+≡
    subroutine cmd_analysis_execute (cmd, global)
        class(cmd_analysis_t), intent(inout) :: cmd
        type(rt_data_t), intent(inout), target :: global
        global%pn%analysis_expr => cmd%pn_expr
    end subroutine cmd_analysis_execute

```

### Write histograms and plots

The data type encapsulating the command:

```

⟨Commands: types⟩+≡
    type, extends (command_t) :: cmd_write_analysis_t
        private
        type(analysis_id_t), dimension(:), allocatable :: id
        type(string_t), dimension(:), allocatable :: tag
    contains
    ⟨Commands: cmd write analysis: TBP⟩
end type cmd_write_analysis_t

```

Output. Just the keyword.

```

⟨Commands: cmd write analysis: TBP⟩≡
    procedure :: write => cmd_write_analysis_write
⟨Commands: procedures⟩+≡
    subroutine cmd_write_analysis_write (cmd, unit, indent)
        class(cmd_write_analysis_t), intent(in) :: cmd
        integer, intent(in), optional :: unit, indent
        integer :: u
        u = given_output_unit (unit); if (u < 0) return
        call write_indent (u, indent)
        write (u, "(1x,A)") "write_analysis"
    end subroutine cmd_write_analysis_write

```

Compile.

```

⟨Commands: cmd write analysis: TBP⟩+≡
    procedure :: compile => cmd_write_analysis_compile
⟨Commands: procedures⟩+≡
    subroutine cmd_write_analysis_compile (cmd, global)
        class(cmd_write_analysis_t), intent(inout) :: cmd
        type(rt_data_t), intent(inout), target :: global
        type(parse_node_t), pointer :: pn_clause, pn_args, pn_id
        integer :: n, i
        pn_clause => parse_node_get_sub_ptr (cmd%pn)
        pn_args => parse_node_get_sub_ptr (pn_clause, 2)
        cmd%pn_opt => parse_node_get_next_ptr (pn_clause)
        call cmd%compile_options (global)
        if (associated (pn_args)) then
            n = parse_node_get_n_sub (pn_args)
            allocate (cmd%id (n))
            do i = 1, n
                pn_id => parse_node_get_sub_ptr (pn_args, i)

```

```

        if (char (parse_node_get_rule_key (pn_id)) == "analysis_id") then
            cmd%id(i)%tag = parse_node_get_string (pn_id)
        else
            cmd%id(i)%pn_sexpr => pn_id
        end if
    end do
else
    allocate (cmd%id (0))
end if
end subroutine cmd_write_analysis_compile

```

The output format for real data values:

*(Commands: parameters)*+≡

```

character(*), parameter, public :: &
    DEFAULT_ANALYSIS_FILENAME = "whizard_analysis.dat"
character(len=1), dimension(2), parameter, public :: &
    FORBIDDEN_ENDINGS1 = [ "o", "a" ]
character(len=2), dimension(5), parameter, public :: &
    FORBIDDEN_ENDINGS2 = [ "mp", "ps", "vg", "lo", "la" ]
character(len=3), dimension(16), parameter, public :: &
    FORBIDDEN_ENDINGS3 = [ "aux", "dvi", "evt", "evx", "f03", "f90", &
                           "f95", "log", "ltp", "mpx", "olc", "olp", "pdf", "phs", "sin", "tex" ]

```

As this contains a lot of similar code to `cmd_compile_analysis_execute` we outsource the main code to a subroutine.

*(Commands: cmd write analysis: TBP)*+≡

```

procedure :: execute => cmd_write_analysis_execute

```

*(Commands: procedures)*+≡

```

subroutine cmd_write_analysis_execute (cmd, global)
    class(cmd_write_analysis_t), intent(inout) :: cmd
    type(rt_data_t), intent(inout), target :: global
    type(var_list_t), pointer :: var_list
    var_list => cmd%local%get_var_list_ptr ()
    call write_analysis_wrap (var_list, global%out_files, &
                           cmd%id, tag = cmd%tag)
end subroutine cmd_write_analysis_execute

```

If the `data_file` optional argument is present, this is called from `cmd_compile_analysis_execute`, which needs the file name for further processing, and requires the default format. For the moment, parameters and macros for custom data processing are disabled.

*(Commands: procedures)*+≡

```

subroutine write_analysis_wrap (var_list, out_files, id, tag, data_file)
    type(var_list_t), intent(inout), target :: var_list
    type(file_list_t), intent(inout), target :: out_files
    type(analysis_id_t), dimension(:), intent(in), target :: id
    type(string_t), dimension(:), allocatable, intent(out) :: tag

### 32.1.4 User-controlled output to data files

#### Open file (output)

Open a file for output.

```

⟨Commands: types⟩+≡
  type, extends (command_t) :: cmd_open_out_t
    private
    type(parse_node_t), pointer :: file_expr => null ()
  contains
    ⟨Commands: cmd open out: TBP⟩
  end type cmd_open_out_t

```

Finalizer for the embedded eval tree.

```

⟨Commands: procedures⟩+≡
  subroutine cmd_open_out_final (object)
    class(cmd_open_out_t), intent(inout) :: object
  end subroutine cmd_open_out_final

```

Output (trivial here).

```

⟨Commands: cmd open out: TBP⟩≡
  procedure :: write => cmd_open_out_write
⟨Commands: procedures⟩+≡
  subroutine cmd_open_out_write (cmd, unit, indent)
    class(cmd_open_out_t), intent(in) :: cmd
    integer, intent(in), optional :: unit, indent
    integer :: u
    u = given_output_unit (unit);  if (u < 0)  return
    call write_indent (u, indent)
    write (u, "(1x,A)", advance="no")  "open_out: <filename>"
  end subroutine cmd_open_out_write

```

Compile: create an eval tree for the filename expression.

```

⟨Commands: cmd open out: TBP⟩+≡
  procedure :: compile => cmd_open_out_compile
⟨Commands: procedures⟩+≡
  subroutine cmd_open_out_compile (cmd, global)
    class(cmd_open_out_t), intent(inout) :: cmd
    type(rt_data_t), intent(inout), target :: global
    cmd%file_expr => parse_node_get_sub_ptr (cmd%pn, 2)
    if (associated (cmd%file_expr)) then
      cmd%pn_opt => parse_node_get_next_ptr (cmd%file_expr)
    end if
    call cmd%compile_options (global)
  end subroutine cmd_open_out_compile

```

Execute: append the file to the global list of open files.

```

⟨Commands: cmd open out: TBP⟩+≡
procedure :: execute => cmd_open_out_execute
⟨Commands: procedures⟩+≡
subroutine cmd_open_out_execute (cmd, global)
  class(cmd_open_out_t), intent(inout) :: cmd
  type(rt_data_t), intent(inout), target :: global
  type(var_list_t), pointer :: var_list
  type(eval_tree_t) :: file_expr
  type(string_t) :: file

  call file_expr%init_sexpr (cmd%file_expr, var_list)
  call file_expr%evaluate ()
  if (file_expr%is_known ()) then
    file = file_expr%get_string ()
    call file_list_open (global%out_files, file, &
      action = "write", status = "replace", position = "asis")
  else
    call msg_fatal ("open_out: file name argument evaluates to unknown")
  end if
  call file_expr%final ()
end subroutine cmd_open_out_execute

```

### Open file (output)

Close an output file. Except for the `execute` method, everything is analogous to the `open` command, so we can just inherit.

```

⟨Commands: types⟩+≡
type, extends (cmd_open_out_t) :: cmd_close_out_t
  private
  contains
⟨Commands: cmd close out: TBP⟩
end type cmd_close_out_t

```

Execute: remove the file from the global list of output files.

```

⟨Commands: cmd close out: TBP⟩≡
procedure :: execute => cmd_close_out_execute
⟨Commands: procedures⟩+≡
subroutine cmd_close_out_execute (cmd, global)
  class(cmd_close_out_t), intent(inout) :: cmd
  type(rt_data_t), intent(inout), target :: global
  type(var_list_t), pointer :: var_list
  type(eval_tree_t) :: file_expr
  type(string_t) :: file
  var_list => cmd%local%var_list
  call file_expr%init_sexpr (cmd%file_expr, var_list)
  call file_expr%evaluate ()
  if (file_expr%is_known ()) then
    file = file_expr%get_string ()
    call file_list_close (global%out_files, file)
  else

```

```

    call msg_fatal ("close_out: file name argument evaluates to unknown")
end if
call file_expr%final ()
end subroutine cmd_close_out_execute

```

### 32.1.5 Print custom-formatted values

*(Commands: types)*+≡

```

type, extends (command_t) :: cmd_printf_t
private
type(parse_node_t), pointer :: sexpr => null ()
type(parse_node_t), pointer :: sprintf_fun => null ()
type(parse_node_t), pointer :: sprintf_clause => null ()
type(parse_node_t), pointer :: sprintf => null ()
contains
(Commands: cmd printf: TBP)
end type cmd_printf_t

```

Finalize.

*(Commands: cmd printf: TBP)*≡

```

procedure :: final => cmd_printf_final
(Commands: procedures)+≡
subroutine cmd_printf_final (cmd)
class(cmd_printf_t), intent(inout) :: cmd
call parse_node_final (cmd%sexpr, recursive = .false.)
deallocate (cmd%sexpr)
call parse_node_final (cmd%sprintf_fun, recursive = .false.)
deallocate (cmd%sprintf_fun)
call parse_node_final (cmd%sprintf_clause, recursive = .false.)
deallocate (cmd%sprintf_clause)
call parse_node_final (cmd%sprintf, recursive = .false.)
deallocate (cmd%sprintf)
end subroutine cmd_printf_final

```

Output. Do not print the parse tree, since this may get cluttered. Just a message that cuts have been defined.

*(Commands: cmd printf: TBP)*+≡

```

procedure :: write => cmd_printf_write
(Commands: procedures)+≡
subroutine cmd_printf_write (cmd, unit, indent)
class(cmd_printf_t), intent(in) :: cmd
integer, intent(in), optional :: unit, indent
integer :: u
u = given_output_unit (unit);  if (u < 0)  return
call write_indent (u, indent)
write (u, "(1x,A)") "printf:"
end subroutine cmd_printf_write

```

Compile. We create a fake parse node (subtree) with a `sprintf` command with identical arguments which can then be handled by the corresponding evaluation procedure.

```
(Commands: cmd printf: TBP)+≡
procedure :: compile => cmd_printf_compile

(Commands: procedures)+≡
subroutine cmd_printf_compile (cmd, global)
  class(cmd_printf_t), intent(inout) :: cmd
  type(rt_data_t), intent(inout), target :: global
  type(parse_node_t), pointer :: pn_cmd, pn_clause, pn_args, pn_format
  pn_cmd => parse_node_get_sub_ptr (cmd%pn)
  pn_clause => parse_node_get_sub_ptr (pn_cmd)
  pn_format => parse_node_get_sub_ptr (pn_clause, 2)
  pn_args => parse_node_get_next_ptr (pn_clause)
  cmd%pn_opt => parse_node_get_next_ptr (pn_cmd)
  call cmd%compile_options (global)

    syntax_get_rule_ptr (syntax_cmd_list, var_str ("sexpr")))
  allocate (cmd%sprintf_fun)
  call parse_node_create_branch (cmd%sprintf_fun, &
    syntax_get_rule_ptr (syntax_cmd_list, var_str ("sprintf_fun")))
  allocate (cmd%sprintf_clause)
  call parse_node_create_branch (cmd%sprintf_clause, &
    syntax_get_rule_ptr (syntax_cmd_list, var_str ("sprintf_clause")))
  allocate (cmd%sprintf)
  call parse_node_create_key (cmd%sprintf, &
    syntax_get_rule_ptr (syntax_cmd_list, var_str ("sprintf")))
  call parse_node_append_sub (cmd%sprintf_clause, cmd%sprintf)
  call parse_node_append_sub (cmd%sprintf_clause, pn_format)
  call parse_node_freeze_branch (cmd%sprintf_clause)
  call parse_node_append_sub (cmd%sprintf_fun, cmd%sprintf_clause)
  if (associated (pn_args)) then
    call parse_node_append_sub (cmd%sprintf_fun, pn_args)
  end if
  call parse_node_freeze_branch (cmd%sprintf_fun)
  call parse_node_append_sub (cmd%sexpr, cmd%sprintf_fun)
  call parse_node_freeze_branch (cmd%sexpr)
end subroutine cmd_printf_compile
```

Execute. Evaluate the string (pretending this is a `sprintf` expression) and print it.

```
(Commands: cmd printf: TBP)+≡
procedure :: execute => cmd_printf_execute

(Commands: procedures)+≡
subroutine cmd_printf_execute (cmd, global)
  class(cmd_printf_t), intent(inout) :: cmd
  type(rt_data_t), intent(inout), target :: global
  type(var_list_t), pointer :: var_list
  type(string_t) :: string, file
  type(eval_tree_t) :: sprintf_expr
  logical :: advance
```

```

var_list => cmd%local%get_var_list_ptr ()
advance = var_list%get_lval (&
    var_str ("?out_advance"))
file = var_list%get_sval (&
    var_str ("$out_file"))
call sprintf_expr%init_sexpr (cmd%sexpr, var_list)
call sprintf_expr%evaluate ()
if (sprintf_expr%is_known ()) then
    string = sprintf_expr%get_string ()
    if (len (file) == 0) then
        call msg_result (char (string))
    else
        call file_list_write (global%out_files, file, string, advance)
    end if
end if
end subroutine cmd_printf_execute

```

## Record data

The expression syntax already contains a `record` keyword; this evaluates to a logical which is always true, but it has the side-effect of recording data into analysis objects. Here we define a command as an interface to this construct.

```

⟨Commands: types⟩+≡
type, extends (command_t) :: cmd_record_t
private
type(parse_node_t), pointer :: pn_expr => null ()
contains
⟨Commands: cmd record: TBP⟩
end type cmd_record_t

```

Output. With the compile hack below, there is nothing of interest to print here.

```

⟨Commands: cmd record: TBP⟩≡
procedure :: write => cmd_record_write
⟨Commands: procedures⟩+≡
subroutine cmd_record_write (cmd, unit, indent)
class(cmd_record_t), intent(in) :: cmd
integer, intent(in), optional :: unit, indent
integer :: u
u = given_output_unit (unit);  if (u < 0)  return
call write_indent (u, indent)
write (u, "(1x,A)")  "record"
end subroutine cmd_record_write

```

Compile. This is a hack which transforms the `record` command into a `record` expression, which we handle in the `expressions` module.

```

⟨Commands: cmd record: TBP⟩+≡
procedure :: compile => cmd_record_compile
⟨Commands: procedures⟩+≡
subroutine cmd_record_compile (cmd, global)
class(cmd_record_t), intent(inout) :: cmd

```

```

type(rt_data_t), intent(inout), target :: global
type(parse_node_t), pointer :: pn_lexpr, pn_lsinglet, pn_lterm, pn_record
call parse_node_create_branch (pn_lexpr, &
    syntax_get_rule_ptr (syntax_cmd_list, var_str ("expr")))
call parse_node_create_branch (pn_lsinglet, &
    syntax_get_rule_ptr (syntax_cmd_list, var_str ("lsinglet")))
call parse_node_append_sub (pn_lexpr, pn_lsinglet)
call parse_node_create_branch (pn_lterm, &
    syntax_get_rule_ptr (syntax_cmd_list, var_str ("lterm")))
call parse_node_append_sub (pn_lsinglet, pn_lterm)
pn_record => parse_node_get_sub_ptr (cmd%pn)
call parse_node_append_sub (pn_lterm, pn_record)
cmd%pn_lexpr => pn_lexpr
end subroutine cmd_record_compile

```

Command execution. Again, transfer this to the embedded expression and just forget the logical result.

```

⟨Commands: cmd record: TBP⟩+≡
procedure :: execute => cmd_record_execute
⟨Commands: procedures⟩+≡
subroutine cmd_record_execute (cmd, global)
    class(cmd_record_t), intent(inout) :: cmd
    type(rt_data_t), intent(inout), target :: global
    type(var_list_t), pointer :: var_list
    logical :: lval
    var_list => global%get_var_list_ptr ()
    lval = eval_log (cmd%pn_lexpr, var_list)
end subroutine cmd_record_execute

```

## Unstable particles

Mark a particle as unstable. For each unstable particle, we store a number of decay channels and compute their respective BRs.

```

⟨Commands: types⟩+≡
type, extends (command_t) :: cmd_unstable_t
    private
    integer :: n_proc = 0
    type(string_t), dimension(:), allocatable :: process_id
    type(parse_node_t), pointer :: pn_prt_in => null ()
    contains
    ⟨Commands: cmd unstable: TBP⟩
end type cmd_unstable_t

```

Output: we know the process IDs.

```

⟨Commands: cmd unstable: TBP⟩≡
procedure :: write => cmd_unstable_write
⟨Commands: procedures⟩+≡
subroutine cmd_unstable_write (cmd, unit, indent)
    class(cmd_unstable_t), intent(in) :: cmd
    integer, intent(in), optional :: unit, indent

```

```

integer :: u, i
u = given_output_unit (unit);  if (u < 0)  return
call write_indent (u, indent)
write (u, "(1x,A,1x,I0,1x,A)", advance="no")  &
    "unstable:", 1, "("
do i = 1, cmd%n_proc
    if (i > 1) write (u, "(A,1x)", advance="no")  ","
    write (u, "(A)", advance="no")  char (cmd%process_id(i))
end do
write (u, "(A)") ")"
end subroutine cmd_unstable_write

```

Compile. Initiate an eval tree for the decaying particle and determine the decay channel process IDs.

```

⟨Commands: cmd unstable: TBP⟩+≡
procedure :: compile => cmd_unstable_compile
⟨Commands: procedures⟩+≡
subroutine cmd_unstable_compile (cmd, global)
    class(cmd_unstable_t), intent(inout) :: cmd

end subroutine err_unstable

```

Auto decays: create process IDs and make up process configurations, using the PDG codes generated by the `ds_table` make method.

We allocate and use a self-contained process library that contains only the decay processes of the current particle. When done, we revert the global library pointer to the original library but return the name of the new one. The new library becomes part of the global library stack and can thus be referred to at any time.

```

Build an alternative setup: the parse tree is stored in the global environment. We create a temporary command list to compile and execute this; the result is an alternative local environment `alt_env` which we can hand over to the `simulate` command.

*(Commands: procedures)*+≡

```

recursive subroutine build_alt_setup (alt_env, global, pn)
    type(rt_data_t), intent(inout), target :: alt_env
    type(rt_data_t), intent(inout), target :: global
    type(parse_node_t), intent(in), target :: pn
    type(command_list_t), allocatable :: alt_options
    allocate (alt_options)
    call alt_env%local_init (global)
    call alt_env%activate ()
    call alt_options%compile (pn, alt_env)
    call alt_options%execute (alt_env)
    call alt_env%deactivate (global, keep_local = .true.)
    call alt_options%final ()
end subroutine build_alt_setup

```

### The rescan command

This is the actual SINDARIN command.

*(Commands: types)*+≡

```

type, extends (command_t) :: cmd_rescan_t
    ! private
    type(parse_node_t), pointer :: pn_filename => null ()
    integer :: n_proc = 0
    type(string_t), dimension(:), allocatable :: process_id
contains
    <i>(Commands: cmd rescan: TBP)</i>
end type cmd_rescan_t

```

Output: we know the process IDs.

*(Commands: cmd rescan: TBP)*≡

```

procedure :: write => cmd_rescan_write
<i>(Commands: procedures)</i>+≡
subroutine cmd_rescan_write (cmd, unit, indent)
    class(cmd_rescan_t), intent(in) :: cmd
    integer, intent(in), optional :: unit, indent
    integer :: u, i
    u = given_output_unit (unit);  if (u < 0)  return
    call write_indent (u, indent)

```

```

    write (u, "(1x,A)", advance="no") "rescan (" 
do i = 1, cmd%n_proc
    if (i > 1) write (u, "(A,1x)", advance="no") ","
    write (u, "(A)", advance="no") char (cmd%process_id(i))
end do
write (u, "(A)") ")"
end subroutine cmd_rescan_write

```

Compile. The command takes a suffix argument, namely the file name of requested event file.

```

## Range expressions

We need a special type for storing and evaluating range expressions.

```

⟨Commands: parameters⟩+≡
integer, parameter :: STEP_NONE = 0
integer, parameter :: STEP_ADD = 1
integer, parameter :: STEP_SUB = 2
integer, parameter :: STEP_MUL = 3
integer, parameter :: STEP_DIV = 4
integer, parameter :: STEP_COMP_ADD = 11
integer, parameter :: STEP_COMP_MUL = 13

```

There is an abstract base type and two implementations: scan over integers and scan over reals.

```
(Commands: types)+≡
type, abstract :: range_t
    type(parse_node_t), pointer :: pn_expr => null ()
    type(parse_node_t), pointer :: pn_term => null ()
    type(parse_node_t), pointer :: pn_factor => null ()
    type(parse_node_t), pointer :: pn_value => null ()
    type(parse_node_t), pointer :: pn_literal => null ()
    type(parse_node_t), pointer :: pn_beg => null ()
    type(parse_node_t), pointer :: pn_end => null ()
    type(parse_node_t), pointer :: pn_step => null ()
    type(eval_tree_t) :: expr_beg
    type(eval_tree_t) :: expr_end
    type(eval_tree_t) :: expr_step
    integer :: step_mode = 0
    integer :: n_step = 0
contains
(Commands: range: TBP)
end type range_t
```

These are the implementations:

```
(Commands: types)+≡
type, extends (range_t) :: range_int_t
    integer :: i_beg = 0
    integer :: i_end = 0
    integer :: i_step = 0
contains
(Commands: range int: TBP)
end type range_int_t

type, extends (range_t) :: range_real_t
    real(default) :: r_beg = 0
    real(default) :: r_end = 0
    real(default) :: r_step = 0
    real(default) :: lr_beg = 0
    real(default) :: lr_end = 0
    real(default) :: lr_step = 0
contains
(Commands: range real: TBP)
end type range_real_t
```

Finalize the allocated dummy node. The other nodes are just pointers.

```
(Commands: range: TBP)≡
procedure :: final => range_final
(Commands: procedures)+≡
subroutine range_final (object)
    class(range_t), intent(inout) :: object
    if (associated (object%pn_expr)) then
        call parse_node_final (object%pn_expr, recursive = .false.)
        call parse_node_final (object%pn_term, recursive = .false.)
        call parse_node_final (object%pn_factor, recursive = .false.)
```

```

call parse_node_final (object%pn_value, recursive = .false.)
call parse_node_final (object%pn_literal, recursive = .false.)
deallocate (object%pn_expr)
deallocate (object%pn_term)
deallocate (object%pn_factor)
deallocate (object%pn_value)
deallocate (object%pn_literal)
end if
end subroutine range_final

```

Output.

```

end subroutine range_init

```

This method manually creates a parse node (actually, a cascade of parse nodes) that hold a constant value as a literal. The idea is that this node is inserted as the right-hand side of a fake variable assignment, which is prepended to each scan iteration. Before the variable assignment is compiled and executed, we can manually reset the value of the literal and thus pretend that the loop variable is assigned this value.

### Scan over parameters and other objects

The scan command allocates a new parse node for the variable assignment (the lhs). The rhs of this parse node is assigned from the available rhs expressions in the scan list, one at a time, so the compiled parse node can be prepended to the scan body.

Note: for the integer/real range array, the obvious implementation as a polymorphic array is suspended because in gfortran 4.7, polymorphic arrays are apparently broken.

```

⟨Commands: types⟩+≡
type, extends (command_t) :: cmd_scan_t

end subroutine cmd_scan_write

```

Compile the scan command. We construct a new parse node that implements the variable assignment for a single element on the rhs, instead of the whole list that we get from the original parse tree. By simply copying the node, we copy all pointers and inherit the targets from the original. During execution, we should replace the rhs by the stored rhs pointers (the list elements), one by one, then (re)compile the redefined node.

```

Execute the loop for all values in the step list. We use the parse trees with single variable assignment that we have stored, to iteratively create a local environment, execute the stored commands, and destroy it again. When we encounter a range object, we execute the commands for each value that this object provides. Computing this value has the side effect of modifying the rhs of the variable assignment that heads the local command list, directly in the local parse tree.

```

```

## Conditionals

Conditionals are implemented as a list that is compiled and evaluated recursively; this allows for a straightforward representation of `else if` constructs. A `cmd_if_t` object can hold either an `else_if` clause which is another object of this type, or an `else_body`, but not both.

If- or else-bodies are no scoping units, so all data remain global and no copy-in copy-out is needed.

```
(Commands: types) +≡
  type, extends (command_t) :: cmd_if_t
    private
      type(parse_node_t), pointer :: pn_if_lexer => null ()
      type(command_list_t), pointer :: if_body => null ()
      type(cmd_if_t), dimension(:), pointer :: elseif_cmd => null ()
      type(command_list_t), pointer :: else_body => null ()
    contains
      (Commands: cmd if: TBP)
  end type cmd_if_t
```

Finalizer. There are no local options, therefore we can simply override the default finalizer.

```
(Commands: cmd if: TBP) ≡
  procedure :: final => cmd_if_final
(Commands: procedures) +≡
  recursive subroutine cmd_if_final (cmd)
    class(cmd_if_t), intent(inout) :: cmd
    integer :: i
    if (associated (cmd%if_body)) then
      call command_list_final (cmd%if_body)
      deallocate (cmd%if_body)
    end if
    if (associated (cmd%elseif_cmd)) then
      do i = 1, size (cmd%elseif_cmd)
        call cmd_if_final (cmd%elseif_cmd(i))
      end do
      deallocate (cmd%elseif_cmd)
    end if
    if (associated (cmd%else_body)) then
      call command_list_final (cmd%else_body)
      deallocate (cmd%else_body)
    end if
  end subroutine cmd_if_final
```

Output. Recursively write the command lists.

```
(Commands: cmd if: TBP) +≡

### Include another command-list file

The include command allocates a local parse tree. This must not be deleted before the command object itself is deleted, since pointers may point to subobjects of it.

```

⟨Commands: types⟩+≡
type, extends (command_t) :: cmd_include_t
    private
    type(string_t) :: file
    type(command_list_t), pointer :: command_list => null ()
    type(parse_tree_t) :: parse_tree
contains
    ⟨Commands: cmd include: TBP⟩
end type cmd_include_t

```

Finalizer: delete the command list. No options, so we can simply override the default finalizer.

```

⟨Commands: cmd include: TBP⟩≡
procedure :: final => cmd_include_final
⟨Commands: procedures⟩+≡
    subroutine cmd_include_final (cmd)
        class(cmd_include_t), intent(inout) :: cmd
        call parse_tree_final (cmd%parse_tree)
        if (associated (cmd%command_list)) then
            call cmd%command_list%final ()
            deallocate (cmd%command_list)
        end if

```

```
end subroutine cmd_include_final
```

Write: display the command list as-is, if allocated.

```
<Commands: cmd include: TBP>+≡
procedure :: write => cmd_include_write
<Commands: procedures>+≡
subroutine cmd_include_write (cmd, unit, indent)
  class(cmd_include_t), intent(in) :: cmd
  integer, intent(in), optional :: unit, indent
  integer :: u, ind
  u = given_output_unit (unit)
  ind = 0; if (present (indent)) ind = indent
  call write_indent (u, indent)
  write (u, "(A,A,A,A)") "include ", "", char (cmd%file), ""
  if (associated (cmd%command_list)) then
    call cmd%command_list%write (u, ind + 1)
  end if
end subroutine cmd_include_write
```

Compile file contents: First parse the file, then immediately compile its contents.  
Use the global data set.

```
<Commands: cmd include: TBP>+≡
procedure :: compile => cmd_include_compile
<Commands: procedures>+≡
subroutine cmd_include_compile (cmd, global)
  class(cmd_include_t), intent(inout) :: cmd
  type(rt_data_t), intent(inout), target :: global
  type(parse_node_t), pointer :: pn_arg, pn_file
  type(string_t) :: file
  logical :: exist
  integer :: u
  type(stream_t), target :: stream
  type(lexer_t) :: lexer
  pn_arg => parse_node_get_sub_ptr (cmd%pn, 2)
  pn_file => parse_node_get_sub_ptr (pn_arg)
  file = parse_node_get_string (pn_file)
  inquire (file=char(file), exist=exist)
  if (exist) then
    cmd%file = file
  else
    cmd%file = global%os_data%whizard_cutspath // "/" // file
    inquire (file=char(cmd%file), exist=exist)
    if (.not. exist) then
      call msg_error ("Include file '" // char (file) // "' not found")
      return
    end if
  end if
  u = free_unit ()
  call lexer_init_cmd_list (lexer, global%lexer)
  call stream_init (stream, char (cmd%file))
  call lexer_assign_stream (lexer, stream)
  call parse_tree_init (cmd%parse_tree, syntax_cmd_list, lexer)
```

```

call stream_final (stream)
call lexer_final (lexer)
close (u)
allocate (cmd%command_list)
call cmd%command_list%compile (cmd%parse_tree%get_root_ptr (), &
    global)
end subroutine cmd_include_compile

```

Execute file contents in the global context.

```

⟨Commands: cmd include: TBP⟩+≡
procedure :: execute => cmd_include_execute
⟨Commands: procedures⟩+≡
subroutine cmd_include_execute (cmd, global)
    class(cmd_include_t), intent(inout) :: cmd
    type(rt_data_t), intent(inout), target :: global
    if (associated (cmd%command_list)) then
        call msg_message &
            ("Including Sindarin from '" // char (cmd%file) // "'")
        call cmd%command_list%execute (global)
        call msg_message &
            ("End of included '" // char (cmd%file) // "'")
    end if
end subroutine cmd_include_execute

```

### Quit command execution

The code is the return code of the whole program if it is terminated by this command.

```

⟨Commands: types⟩+≡
type, extends (command_t) :: cmd_quit_t
    private
    logical :: has_code = .false.
    type(parse_node_t), pointer :: pn_code_expr => null ()
contains
⟨Commands: cmd quit: TBP⟩
end type cmd_quit_t

```

Output.

```

⟨Commands: cmd quit: TBP⟩≡
procedure :: write => cmd_quit_write
⟨Commands: procedures⟩+≡
subroutine cmd_quit_write (cmd, unit, indent)
    class(cmd_quit_t), intent(in) :: cmd
    integer, intent(in), optional :: unit, indent
    integer :: u
    u = given_output_unit (unit);  if (u < 0)  return
    call write_indent (u, indent)
    write (u, "(1x,A,L1)") "quit: has_code = ", cmd%has_code
end subroutine cmd_quit_write

```

Compile: allocate a quit object which serves as a placeholder.

```
(Commands: cmd quit: TBP)+≡
    procedure :: compile => cmd_quit_compile
(Commands: procedures)+≡
    subroutine cmd_quit_compile (cmd, global)
        class(cmd_quit_t), intent(inout) :: cmd
        type(rt_data_t), intent(inout), target :: global
        type(parse_node_t), pointer :: pn_arg
        pn_arg => parse_node_get_sub_ptr (cmd%pn, 2)
        if (associated (pn_arg)) then
            cmd%pn_code_expr => parse_node_get_sub_ptr (pn_arg)
            cmd%has_code = .true.
        end if
    end subroutine cmd_quit_compile
```

Execute: The quit command does not execute anything, it just stops command execution. This is achieved by setting quit flag and quit code in the global variable list. However, the return code, if present, is an expression which has to be evaluated.

```
(Commands: cmd quit: TBP)+≡
    procedure :: execute => cmd_quit_execute
(Commands: procedures)+≡
    subroutine cmd_quit_execute (cmd, global)
        class(cmd_quit_t), intent(inout) :: cmd
        type(rt_data_t), intent(inout), target :: global
        type(var_list_t), pointer :: var_list
        logical :: is_known
        var_list => global%get_var_list_ptr ()
        if (cmd%has_code) then
            global%quit_code = eval_int (cmd%pn_code_expr, var_list, &
                is_known=is_known)
            if (.not. is_known) then
                call msg_error ("Undefined return code of quit/exit command")
            end if
        end if
        global%quit = .true.
    end subroutine cmd_quit_execute
```

### 32.1.6 The command list

The command list holds a list of commands and relevant global data.

```
(Commands: public)+≡
    public :: command_list_t
(Commands: types)+≡
    type :: command_list_t
        ! not private anymore as required by the whizard-c-interface
        class(command_t), pointer :: first => null ()
        class(command_t), pointer :: last => null ()
contains
(Commands: command list: TBP)
```

```
end type command_list_t
```

Output.

```
(Commands: command list: TBP)≡
    procedure :: write => command_list_write
(Commands: procedures)+≡
    recursive subroutine command_list_write (cmd_list, unit, indent)
        class(command_list_t), intent(in) :: cmd_list
        integer, intent(in), optional :: unit, indent
        class(command_t), pointer :: cmd
        cmd => cmd_list%first
        do while (associated (cmd))
            call cmd%write (unit, indent)
            cmd => cmd%next
        end do
    end subroutine command_list_write
```

Append a new command to the list and free the original pointer.

```
(Commands: command list: TBP)+≡
    procedure :: append => command_list_append
(Commands: procedures)+≡
    subroutine command_list_append (cmd_list, command)
        class(command_list_t), intent(inout) :: cmd_list
        class(command_t), intent(inout), pointer :: command
        if (associated (cmd_list%last)) then
            cmd_list%last%next => command
        else
            cmd_list%first => command
        end if
        cmd_list%last => command
        command => null ()
    end subroutine command_list_append
```

Finalize.

```
(Commands: command list: TBP)+≡
    procedure :: final => command_list_final
(Commands: procedures)+≡
    recursive subroutine command_list_final (cmd_list)
        class(command_list_t), intent(inout) :: cmd_list
        class(command_t), pointer :: command
        do while (associated (cmd_list%first))
            command => cmd_list%first
            cmd_list%first => cmd_list%first%next
            call command%final ()
            deallocate (command)
        end do
        cmd_list%last => null ()
    end subroutine command_list_final
```

### 32.1.7 Compiling the parse tree

Transform a parse tree into a command list. Initialization is assumed to be done.

After each command, we set a breakpoint.

```
(Commands: command list: TBP)+≡
procedure :: compile => command_list_compile

(Commands: procedures)+≡
recursive subroutine command_list_compile (cmd_list, pn, global)
  class(command_list_t), intent(inout), target :: cmd_list
  type(parse_node_t), intent(in), target :: pn
  type(rt_data_t), intent(inout), target :: global
  type(parse_node_t), pointer :: pn_cmd
  class(command_t), pointer :: command
  integer :: i
  pn_cmd => parse_node_get_sub_ptr (pn)
  do i = 1, parse_node_get_n_sub (pn)
    call dispatch_command (command, pn_cmd)
    call command%compile (global)
    call cmd_list%append (command)
    call terminate_now_if_signal ()
    pn_cmd => parse_node_get_next_ptr (pn_cmd)
  end do
end subroutine command_list_compile
```

### 32.1.8 Executing the command list

Before executing a command we should execute its options (if any). After that, reset the options, i.e., remove temporary effects from the global state.

Also here, after each command we set a breakpoint.

```
(Commands: command list: TBP)+≡
procedure :: execute => command_list_execute

(Commands: procedures)+≡
recursive subroutine command_list_execute (cmd_list, global)
  class(command_list_t), intent(in) :: cmd_list
  type(rt_data_t), intent(inout), target :: global
  class(command_t), pointer :: command
  command => cmd_list%first
  COMMAND_COND: do while (associated (command))
    call command%execute_options (global)
    call command%execute (global)
    call command%reset_options (global)
    call terminate_now_if_signal ()
    if (global%quit) exit COMMAND_COND
    command => command%next
  end do COMMAND_COND
end subroutine command_list_execute
```

### 32.1.9 Command list syntax

```
(Commands: public)+≡
  public :: syntax_cmd_list

(Commands: variables)≡
  type(syntax_t), target, save :: syntax_cmd_list

(Commands: public)+≡
  public :: syntax_cmd_list_init

(Commands: procedures)+≡
  subroutine syntax_cmd_list_init ()
    type(ifile_t) :: ifile
    call define_cmd_list_syntax (ifile)
    call syntax_init (syntax_cmd_list, ifile)
    call ifile_final (ifile)
  end subroutine syntax_cmd_list_init

(Commands: public)+≡
  public :: syntax_cmd_list_final

## 32.2 Toplevel module WHIZARD

```
(whizard.f90)≡
  ⟨File header⟩

  module whizard

    use io_units
  ⟨Use strings⟩
    use system_defs, only: VERSION_STRING
    use system_defs, only: EOF, BACKSLASH
    use diagnostics
    use os_interface
    use ifiles
    use lexers
    use parser
    use variables
    use eval_trees
    use models
    use phs_forests
    use prclib_stacks
    use slha_interface
    use blha_config
    use rt_data
    use commands

  ⟨Standard module head⟩

  ⟨WHIZARD: public⟩

  ⟨WHIZARD: types⟩

    save

    contains

  ⟨WHIZARD: procedures⟩

  end module whizard
```

### 32.2.1 Options

Here we introduce a wrapper that holds various user options, so they can transparently be passed from the main program to the `whizard` object. Most parameters are used for initializing the global state.

```
⟨WHIZARD: public⟩≡
  public :: whizard_options_t
⟨WHIZARD: types⟩≡
  type :: whizard_options_t
    type(string_t) :: preload_model
    type(string_t) :: default_lib
    type(string_t) :: preload_libraries
    logical :: rebuild_library = .false.
```

```

logical :: recompile_library = .false.
logical :: rebuild_user
logical :: rebuild_phs = .false.
logical :: rebuild_grids = .false.
logical :: rebuild_events = .false.
end type whizard_options_t

```

### 32.2.2 Parse tree stack

We collect all parse trees that we generate in the `whizard` object. To this end, we create a stack of parse trees. They must not be finalized before the `global` object is finalized, because items such as a cut definition may contain references to the parse tree from which they were generated.

```

⟨WHIZARD: types⟩+≡
  type, extends (parse_tree_t) :: pt_entry_t
    type(pt_entry_t), pointer :: previous => null ()
  end type pt_entry_t

```

This is the stack. Since we always prepend, we just need the `last` pointer.

```

⟨WHIZARD: types⟩+≡
  type :: pt_stack_t
    type(pt_entry_t), pointer :: last => null ()
    contains
      ⟨WHIZARD: pt stack: TBP⟩
  end type pt_stack_t

```

The finalizer is called at the very end.

```

⟨WHIZARD: pt stack: TBP⟩≡
  procedure :: final => pt_stack_final
⟨WHIZARD: procedures⟩≡
  subroutine pt_stack_final (pt_stack)
    class(pt_stack_t), intent(inout) :: pt_stack
    type(pt_entry_t), pointer :: current
    do while (associated (pt_stack%last))
      current => pt_stack%last
      pt_stack%last => current%previous
      call parse_tree_final (current%parse_tree_t)
      deallocate (current)
    end do
  end subroutine pt_stack_final

```

Create and push a new entry, keeping the previous ones.

```

⟨WHIZARD: pt stack: TBP⟩+≡
  procedure :: push => pt_stack_push
⟨WHIZARD: procedures⟩+≡
  subroutine pt_stack_push (pt_stack, parse_tree)
    class(pt_stack_t), intent(inout) :: pt_stack
    type(parse_tree_t), intent(out), pointer :: parse_tree
    type(pt_entry_t), pointer :: current

```

```

allocate (current)
parse_tree => current%parse_tree_t
current%previous => pt_stack%last
pt_stack%last => current
end subroutine pt_stack_push

```

### 32.2.3 The whizard object

An object of type `whizard_t` is the top-level wrapper for a WHIZARD instance. The object holds various default settings and the current state of the generator, the `global` object of type `rt_data_t`. This object contains, for instance, the list of variables and the process libraries.

Since components of the `global` subobject are frequently used as targets, the `whizard` object should also consistently carry the `target` attribute.

The various self-tests do not use this object. They initialize only specific subsets of the system, according to their needs.

Note: we intend to allow several concurrent instances. In the current implementation, there are still a few obstacles to this: the model library and the syntax tables are global variables, and the error handling uses global state. This should be improved.

```

<WHIZARD: public>+≡
public :: whizard_t

<WHIZARD: types>+≡
type :: whizard_t
    type(whizard_options_t) :: options
    type(rt_data_t) :: global
    type(pt_stack_t) :: pt_stack
contains
<WHIZARD: whizard: TBP>
end type whizard_t

```

### 32.2.4 Initialization and finalization

```

<WHIZARD: whizard: TBP>≡
procedure :: init => whizard_init

<WHIZARD: procedures>+≡
subroutine whizard_init (whizard, options, paths, logfile)
    class(whizard_t), intent(out), target :: whizard
    type(whizard_options_t), intent(in) :: options
    type(paths_t), intent(in), optional :: paths
    type(string_t), intent(in), optional :: logfile
    call init_syntax_tables ()
    whizard%options = options
    call whizard%global%global_init (paths, logfile)
    call whizard%init_rebuild_flags ()
    call whizard%preload_model ()
    call whizard%preload_library ()
    call whizard%global%init_fallback_model &
        (var_str ("SM_hadrons"), var_str ("SM_hadrons.mdl"))

```

```

    call whizard%global%init_radiation_model &
        (var_str ("SM_rad"), var_str ("SM_rad.mdl"))
end subroutine whizard_init

```

Apart from the global data which have been initialized above, the process and model lists need to be finalized.

```

<WHIZARD: whizard: TBP>+≡
procedure :: final => whizard_final
<WHIZARD: procedures>+≡
subroutine whizard_final (whizard)
    class(whizard_t), intent(inout), target :: whizard
    call whizard%global%final ()
    call whizard%pt_stack%final ()
!!! JRR: WK please check (#529)
!    call user_code_final ()
    call final_syntax_tables ()
end subroutine whizard_final

```

Set the rebuild flags. They can be specified on the command line and set the initial value for the associated logical variables.

```

<WHIZARD: whizard: TBP>+≡
procedure :: init_rebuild_flags => whizard_init_rebuild_flags
<WHIZARD: procedures>+≡
subroutine whizard_init_rebuild_flags (whizard)
    class(whizard_t), intent(inout), target :: whizard
    associate (var_list => whizard%global%var_list, options => whizard%options)
        call var_list_append_log &
            (var_list, var_str ("?rebuild_library"), options%rebuild_library, &
            intrinsic=.true.)

            if (library_name /= "") then
                allocate (lib_entry)
                call lib_entry%init (library_name)
                call whizard%global%add_prclib (lib_entry)

```

```

    call msg_message ("Preloaded library: " // char (library_name))
end if
end do SCAN_LIBS
end subroutine whizard_preload_library

```

### 32.2.5 Initialization and finalization (old version)

These procedures initialize and finalize global variables. Most of them are collected in the `global` data record located here, the others are syntax tables located in various modules, which do not change during program execution. Furthermore, there is a global model list and a global process store, which get filled during program execution but are finalized here.

During initialization, we can preload a default model and initialize a default library for setting up processes. The default library is loaded if requested by the setup. Further libraries can be loaded as specified by command-line flags. Initialize/finalize the syntax tables used by WHIZARD:

```

⟨WHIZARD: public⟩+≡
public :: init_syntax_tables
public :: final_syntax_tables

⟨WHIZARD: procedures⟩+≡
subroutine init_syntax_tables ()
  call syntax_model_file_init ()
  call syntax_phs_forest_init ()
  call syntax_pexpr_init ()
  call syntax_slha_init ()
  call syntax_blha_contract_init ()
  call syntax_cmd_list_init ()
end subroutine init_syntax_tables

subroutine final_syntax_tables ()
  call syntax_model_file_final ()
  call syntax_phs_forest_final ()
  call syntax_pexpr_final ()
  call syntax_slha_final ()
  call syntax_blha_contract_final ()
  call syntax_cmd_list_final ()
end subroutine final_syntax_tables

```

Write the syntax tables to external files.

```

⟨WHIZARD: public⟩+≡
public :: write_syntax_tables

⟨WHIZARD: procedures⟩+≡
subroutine write_syntax_tables ()
  integer :: unit
  character(*), parameter :: file_model = "whizard.model_file.syntax"
  character(*), parameter :: file_phs = "whizard.phase_space_file.syntax"
  character(*), parameter :: file_pexpr = "whizard.prt_expressions.syntax"
  character(*), parameter :: file_slha = "whizard.slha.syntax"
  character(*), parameter :: file_sindarin = "whizard.sindarin.syntax"
  unit = free_unit ()

```

```

print *, "Writing file '" // file_model // "'"
open (unit=unit, file=file_model, status="replace", action="write")
write (unit, "(A)") VERSION_STRING
write (unit, "(A)") "Syntax definition file: " // file_model
call syntax_model_file_write (unit)
close (unit)
print *, "Writing file '" // file_phs // "'"

call syntax_phs_forest_write (unit)
close (unit)
print *, "Writing file '" // file_pexpr // "'"
open (unit=unit, file=file_pexpr, status="replace", action="write")
write (unit, "(A)") VERSION_STRING
write (unit, "(A)") "Syntax definition file: " // file_pexpr
call syntax_pexpr_write (unit)
close (unit)
print *, "Writing file '" // file_slha // "'"
open (unit=unit, file=file_slha, status="replace", action="write")
write (unit, "(A)") VERSION_STRING
write (unit, "(A)") "Syntax definition file: " // file_slha
call syntax_slha_write (unit)
close (unit)
print *, "Writing file '" // file_sindarin // "'"
open (unit=unit, file=file_sindarin, status="replace", action="write")
write (unit, "(A)") VERSION_STRING
write (unit, "(A)") "Syntax definition file: " // file_sindarin
call syntax_cmd_list_write (unit)
close (unit)
end subroutine write_syntax_tables

```

### 32.2.6 Execute command lists

Process commands given on the command line, stored as an `ifile`. The whole input is read, compiled and executed as a whole.

```

<WHIZARD: whizard: TBP>+≡
procedure :: process_ifile => whizard_process_ifile
<WHIZARD: procedures>+≡
subroutine whizard_process_ifile (whizard, ifile, quit, quit_code)
  class(whizard_t), intent(inout), target :: whizard
  type(ifile_t), intent(in) :: ifile
  logical, intent(out) :: quit
  integer, intent(out) :: quit_code
  type(lexer_t), target :: lexer
  type(stream_t), target :: stream
  call msg_message ("Reading commands given on the command line")
  call lexer_init_cmd_list (lexer)
  call stream_init (stream, ifile)
  call whizard%process_stream (stream, lexer, quit, quit_code)
  call stream_final (stream)
  call lexer_final (lexer)

```

```
end subroutine whizard_process_ifile
```

Process standard input as a command list. The whole input is read, compiled and executed as a whole.

```
(WHIZARD: whizard: TBP)+≡
    procedure :: process_stdin => whizard_process_stdin
(WHIZARD: procedures)+≡
    subroutine whizard_process_stdin (whizard, quit, quit_code)
        class(whizard_t), intent(inout), target :: whizard
        logical, intent(out) :: quit
        integer, intent(out) :: quit_code
        type(lexer_t), target :: lexer
        type(stream_t), target :: stream
        call msg_message ("Reading commands from standard input")
        call lexer_init_cmd_list (lexer)
        call stream_init (stream, 5)
        call whizard%process_stream (stream, lexer, quit, quit_code)
        call stream_final (stream)
        call lexer_final (lexer)
    end subroutine whizard_process_stdin
```

Process a file as a command list.

```
(WHIZARD: whizard: TBP)+≡
    procedure :: process_file => whizard_process_file
(WHIZARD: procedures)+≡
    subroutine whizard_process_file (whizard, file, quit, quit_code)
        class(whizard_t), intent(inout), target :: whizard
        type(string_t), intent(in) :: file
        logical, intent(out) :: quit
        integer, intent(out) :: quit_code
        type(lexer_t), target :: lexer
        type(stream_t), target :: stream
        logical :: exist
        call msg_message ("Reading commands from file '" // char (file) // "'")
        inquire (file=char(file), exist=exist)
        if (exist) then
            call lexer_init_cmd_list (lexer)
            call stream_init (stream, char (file))
            call whizard%process_stream (stream, lexer, quit, quit_code)
            call stream_final (stream)
            call lexer_final (lexer)
        else
            call msg_error ("File '" // char (file) // "' not found")
        end if
    end subroutine whizard_process_file
```

```
(WHIZARD: whizard: TBP)+≡
    procedure :: process_stream => whizard_process_stream
(WHIZARD: procedures)+≡
    subroutine whizard_process_stream (whizard, stream, lexer, quit, quit_code)
        class(whizard_t), intent(inout), target :: whizard
```

```

type(stream_t), intent(inout), target :: stream
type(lexer_t), intent(inout), target :: lexer
logical, intent(out) :: quit
integer, intent(out) :: quit_code
type(parse_tree_t), pointer :: parse_tree
type(command_list_t), target :: command_list
call lexer_assign_stream (lexer, stream)
call whizard%pt_stack%push (parse_tree)
call parse_tree_init (parse_tree, syntax_cmd_list, lexer)
if (associated (parse_tree%get_root_ptr ())) then
    whizard%global%lexer => lexer
    call command_list%compile (parse_tree%get_root_ptr (), &
        whizard%global)
end if
call whizard%global%activate ()
call command_list%execute (whizard%global)
call command_list%final ()
quit = whizard%global%quit
quit_code = whizard%global%quit_code
end subroutine whizard_process_stream

```

### 32.2.7 The WHIZARD shell

This procedure implements interactive mode. One line is processed at a time.

```

<WHIZARD: whizard: TBP>+≡
procedure :: shell => whizard_shell
<WHIZARD: procedures>+≡
subroutine whizard_shell (whizard, quit_code)
    class(whizard_t), intent(inout), target :: whizard
    integer, intent(out) :: quit_code
    type(lexer_t), target :: lexer
    type(stream_t), target :: stream
    type(string_t) :: prompt1
    type(string_t) :: prompt2
    type(string_t) :: input
    type(string_t) :: extra
    integer :: last
    integer :: iostat
    logical :: mask_tmp
    logical :: quit
    call msg_message ("Launching interactive shell")
    call lexer_init_cmd_list (lexer)
    prompt1 = "whish? "
    prompt2 = "      > "
COMMAND_LOOP: do
    call put (6, prompt1)
    call get (5, input, iostat=iostat)
    if (iostat > 0 .or. iostat == EOF) exit COMMAND_LOOP
CONTINUE_INPUT: do
    last = len_trim (input)
    if (extract (input, last, last) /= BACKSLASH) exit CONTINUE_INPUT
    call put (6, prompt2)

```

```
call get (5, extra, iostat=iostat)
if (iostat > 0) exit COMMAND_LOOP
input = replace (input, last, extra)
end do CONTINUE_INPUT
call stream_init (stream, input)
mask_tmp = mask_fatal_errors
mask_fatal_errors = .true.
call whizard%process_stream (stream, lexer, quit, quit_code)
msg_count = 0
mask_fatal_errors = mask_tmp
call stream_final (stream)
if (quit) exit COMMAND_LOOP
end do COMMAND_LOOP
print *
call lexer_final (lexer)
end subroutine whizard_shell
```

### 32.3 Tools for the command line

We don't intent to be very smart here, but this module provides a few small tools that simplify dealing with the command line.

```
<cmdline_options.f90>≡
  <File header>

  module cmdline_options

    <Use strings>
      use diagnostics

    <Standard module head>

    public :: init_options
    public :: no_option_value
    public :: get_option_value

  <Main: cmdline arg len declaration>

  abstract interface
    subroutine msg
      end subroutine msg
  end interface

  procedure (msg), pointer :: print_usage => null ()

contains

  subroutine init_options (usage_msg)
    procedure (msg) :: usage_msg
    print_usage => usage_msg
  end subroutine init_options

  subroutine no_option_value (option, value)
    type(string_t), intent(in) :: option, value
    if (value /= "") then
      call msg_error (" Option '" // char (option) // "' should have no value")
    end if
  end subroutine no_option_value

  function get_option_value (i, option, value) result (string)
    type(string_t) :: string
    integer, intent(inout) :: i
    type(string_t), intent(in) :: option
    type(string_t), intent(in), optional :: value
    character(CMDLINE_ARG_LEN) :: arg_value
    integer :: arg_len, arg_status
    logical :: has_value
    if (present (value)) then
      has_value = value /= ""
    else
      has_value = .false.
    end if
```

```

if (has_value) then
    string = value
else
    i = i + 1
call get_command_argument (i, arg_value, arg_len, arg_status)
select case (arg_status)
case (0)
case (-1)
    call msg_error (" Option value truncated: '" // arg_value // "'")
case default
    call print_usage ()
    call msg_fatal (" Option '" // char (option) // "' needs a value")
end select
select case (arg_value(1:1))
case (">")
    call print_usage ()
    call msg_fatal (" Option '" // char (option) // "' needs a value")
end select
string = trim (arg_value)
end if
end function get_option_value

end module cmdline_options

```

## 32.4 Query Feature Support

This module accesses the various optional features (modules) that WHIZARD can support and reports on their availability.

```
(features.f90)≡
  module features

    use string_utils, only: lower_case
    use system_dependencies, only: WHIZARD_VERSION
  ⟨Features: dependencies⟩

  ⟨Standard module head⟩

  ⟨Features: public⟩

  contains

  ⟨Features: procedures⟩

end module features
```

### 32.4.1 Output

```
⟨Features: public⟩≡
  public :: print_features

⟨Features: procedures⟩≡
  subroutine print_features ()
    print "(A)", "WHIZARD " // WHIZARD_VERSION
    print "(A)", "Build configuration:"
  ⟨Features: config⟩
    print "(A)", "Optional features available in this build:"
  ⟨Features: print⟩
  end subroutine print_features
```

### 32.4.2 Query function

```
⟨Features: procedures⟩+≡
  subroutine check (feature, recognized, result, help)
    character(*), intent(in) :: feature
    logical, intent(out) :: recognized
    character(*), intent(out) :: result, help
    recognized = .true.
    result = "no"
    select case (lower_case(trim(feature)))
  ⟨Features: cases⟩
    case default
      recognized = .false.
    end select
  end subroutine check
```

Print this result:

```
<Features: procedures>+≡
    subroutine print_check (feature)
        character(*), intent(in) :: feature
        character(16) :: f
        logical :: recognized
        character(10) :: result
        character(48) :: help
        call check (feature, recognized, result, help)
        if (.not. recognized) then
            result = "unknown"
            help = ""
        end if
        f = feature
        print "(2x,A,1x,A,'(,A,')')", f, result, trim (help)
    end subroutine print_check
```

### 32.4.3 Basic configuration

```
<Features: config>≡
    call print_check ("precision")
<Features: dependencies>≡

```

## 32.5 Driver program

The main program handles command options, initializes the environment, and runs WHIZARD in a particular mode (interactive, file, standard input).

This is also used in the C interface:

```
<Main: cmdline arg len declaration>≡  
    integer, parameter :: CMDLINE_ARG_LEN = 1000
```

The actual main program:

```
<main.f90>≡  
    <File header>
```

```
program main
```

```
    <Use strings>  
    use unit_tests  
    use system_dependencies  
    use diagnostics  
    use ifiles  
    use os_interface  
    use whizard
```

```
    use cmdline_options  
    use features
```

```
    implicit none
```

```
<Main: cmdline arg len declaration>
```

```
! Main program variable declarations

### 32.6.1 Self-tests

For those self-tests, we need some auxiliary routines that provide an environment. The environment depends on things that are not available at the level of the module that we want to test.

#### Testbed for event I/O

This subroutine prepares a test process with a single event. All objects are allocated via anonymous pointers, because we want to recover the pointers and delete the objects in a separate procedure.

```
(Main: tests)≡
  subroutine prepare_eio_test (event, unweighted, n_alt)
    use variables
    use model_data
    use processes
    use processes_ut, only: prepare_test_process
    use event_base
    use events

    class(generic_event_t), intent(inout), pointer :: event
    logical, intent(in), optional :: unweighted
    integer, intent(in), optional :: n_alt
    type(model_data_t), pointer :: model
    type(var_list_t) :: var_list
    type(process_t), pointer :: process
    type(process_instance_t), pointer :: process_instance

    allocate (model)
    call model%init_test ()

    allocate (process)
    allocate (process_instance)

    call prepare_test_process (process, process_instance, model)
    call process_instance%setup_event_data ()

    call model%final ()
    deallocate (model)

    allocate (event_t :: event)
    select type (event)
    type is (event_t)
      if (present (unweighted)) then
        call var_list_append_log (var_list, &
          var_str ("?unweighted"), unweighted, &
          intrinsic = .true.)
      else
        call var_list_append_log (var_list, &
          var_str ("?unweighted"), .true., &
          intrinsic = .true.)
      end if
      call var_list_append_string (var_list, &
        var_str ("$sample_normalization"), &
```

```

        var_str ("auto"), intrinsic = .true.)
call event%basic_init (var_list, n_alt)
call event%connect (process_instance, process%get_model_ptr ())
call var_list%final ()
end select

end subroutine prepare_eio_test

```

Recover those pointers, finalize the objects and deallocate.

```

>Main: tests)+≡
subroutine cleanup_eio_test (event)

select type (event)
type is (event_t)
    process => event%get_process_ptr ()
    process_instance => event%get_process_instance_ptr ()
    call cleanup_test_process (process, process_instance)
    deallocate (process_instance)
    deallocate (process)
    call event%final ()
end select
deallocate (event)

end subroutine cleanup_eio_test

```

Assign those procedures to appropriate pointers (module variables) in the `eio_base` module, so they can be called as if they were module procedures.

```

>Main: use tests)≡
use eio_base_ut, only: eio_prepare_test
use eio_base_ut, only: eio_cleanup_test

>Main: prepare testbed)≡
eio_prepare_test => prepare_eio_test
eio_cleanup_test => cleanup_eio_test

```

## Any Model

This procedure reads any model from file and, optionally, assigns a var-list pointer.

```

>Main: tests)+≡
subroutine prepare_whizard_model (model, name, vars)
<Use strings>
use os_interface
use model_data
use var_base

```

```

use models
class(model_data_t), intent(inout), pointer :: model
type(string_t), intent(in) :: name
class(vars_t), pointer, intent(out), optional :: vars
type(os_data_t) :: os_data
call syntax_model_file_init ()
call os_data_init (os_data)
allocate (model_t :: model)
select type (model)
type is (model_t)
    call model%read (name // ".mdl", os_data)
    if (present (vars)) then
        vars => model%get_var_list_ptr ()
    end if
end select
end subroutine prepare_whizard_model

```

Cleanup after use. Includes deletion of the model-file syntax.

```

⟨Main: tests⟩+≡
subroutine cleanup_whizard_model (model)
use model_data
use models
class(model_data_t), intent(inout), pointer :: model
call model%final ()
deallocate (model)
call syntax_model_file_final ()
end subroutine cleanup_whizard_model

```

Assign those procedures to appropriate pointers (module variables) in the `model_testbed` module, so they can be called as if they were module procedures.

```

⟨Main: prepare testbed⟩+≡
prepare_model => prepare_whizard_model
cleanup_model => cleanup_whizard_model

```

### Fallback model: hadrons

Some event format tests require the hadronic SM implementation, which has to be read from file. We provide the functionality here, so the tests do not depend on model I/O.

```

⟨Main: tests⟩+≡
subroutine prepare_fallback_model (model)
use model_data
class(model_data_t), intent(inout), pointer :: model
call prepare_whizard_model (model, var_str ("SM_hadrons"))
end subroutine prepare_fallback_model

```

Assign those procedures to appropriate pointers (module variables) in the `eio_base` module, so they can be called as if they were module procedures.

```

⟨Main: use tests⟩+≡
use eio_base_ut, only: eio_prepare_fallback_model
use eio_base_ut, only: eio_cleanup_fallback_model

```

```

⟨Main: prepare testbed⟩+≡
  eio_prepare_fallback_model => prepare_fallback_model
  eio_cleanup_fallback_model => cleanup_model

```

### Access to the test random-number generator

This generator is not normally available for the dispatcher. We assign an additional dispatch routine to the hook in the `dispatch` module which will be checked before the default rule.

```

⟨Main: use tests⟩+≡
  use dispatch, only: dispatch_rng_factory_extra
  use dispatch_ut, only: dispatch_rng_factory_test

⟨Main: prepare testbed⟩+≡
  dispatch_rng_factory_extra => dispatch_rng_factory_test

```

### Access to the test structure functions

These are not normally available for the dispatcher. We assign an additional dispatch routine to the hook in the `dispatch` module which will be checked before the default rule.

```

⟨Main: use tests⟩+≡
  use dispatch, only: dispatch_sf_data_extra
  use dispatch_ut, only: dispatch_sf_data_test

⟨Main: prepare testbed⟩+≡
  dispatch_sf_data_extra => dispatch_sf_data_test

```

### Procedure for Checking

This is for developers only, but needs a well-defined interface.

```

⟨Main: tests⟩+≡
  subroutine whizard_check (check, results)
    use io_units
    use model_testbed

⟨Main: use tests⟩

  type(string_t), intent(in) :: check
  type(test_results_t), intent(inout) :: results
  type(os_data_t) :: os_data
  integer :: u

  call os_data_init (os_data)
  u = free_unit ()
  open (u, file="whizard_check." // char (check) // ".log", &
        action="write", status="replace")
  call msg_message (repeat ('=', 76), 0)
  call msg_message ("Running self-test: " // char (check), 0)
  call msg_message (repeat ('-', 76), 0)
⟨Main: prepare testbed⟩
  select case (char (check))
⟨Main: test cases⟩

```

```

case ("all")
  <Main: all tests>
  case default
    call msg_fatal ("Self-test '" // char (check) // "' not implemented.")
  end select
  close (u)
end subroutine whizard_check

```

### 32.6.2 Unit test references

#### Formats

```

<Main: use tests>+≡
  use formats_ut, only: format_test
<Main: test cases>≡
  case ("formats")
    call format_test (u, results)
<Main: all tests>≡
  call format_test (u, results)

```

#### MD5

```

<Main: use tests>+≡
  use md5_ut, only: md5_test
<Main: test cases>+≡
  case ("md5")
    call md5_test (u, results)
<Main: all tests>+≡
  call md5_test (u, results)

```

#### OS Interface

```

<Main: use tests>+≡
